Mr. H. Eckford, Wem., Salop, showed a dozen new varieties of sweet peas, all charming forms; Mrs. Dugdale, bright rose and white; Duchess of Westminster, bright pink, orange shaded; Coccinea, lovely scarlet; Sadie Burpee, pure white and hooded; Fascination, blue and lavender; Duke of Westminster, deep blue and purple; and Othello, the darkest variety yet produced, intense purple crimson, were those we most admired. All were fine flowers, and three flowers on a stem were very frequent. Mr. T. S. Ware, Hale Farm, Tottenham, exhibited a bright collection of border carnations, hardy herbaceous flowers, and a central bank of liliums that included a specimen of L. nepalense. From Messrs. W. Cutbush and Son, Highgate, came a big group of large bunches of hardy flowers, the liliums, eryngiums, erigerons, sweet peas, phloxes, and carnations making up a fine display on either side of a small group of handsome Malmaison carnations. A most attractive exhibit was that of new plants arranged by Messrs. F. Sander and Co., St. Albans; it consisted largely of Acalypha Sanderiana with its pendant crimson tassels, the variegated A. Godseffianum, and Hæmanthus multiflorus superba.

Roses in abundance and mostly staged in round baskets containing one variety were well shown by Messrs. W. Paul and Son, Waltham Cross; a few of the finest varieties represented were the pretty polyantha Mignonette, Madame Germaino Rand, Madame Jules Grolez, Belle Siebrecht, Enchantress, Souvenir de C. Guillot, Marquise de Salisbury, Souvenir de Lady Ashburton, Milton, Louis van Houtte, Caroline Testout, Crimson Rambler, Captain Christy, and the new Souvenir de Madame Levet, a rich yellow dwarf tea rose. Cacti and various succulent plants were largely and well shown by Messrs. H. Cannell and Sons, Swanley, Kent. The collection was a comprehensive one, and showed the remarkable diversity this family contains; Cereus senilis, Opuntia microdasys, Pilocereus Forsteri, Mamillaria recurvens, Echinocactus Grusoni, and Euphorbia grandicornis were all striking examples.

A large collection of bamboos was arranged through the length of the hall by Mr. J. Garrett, gardener to A. B. Freeman Mitford, Esq., C.B., Batsford Park, Moreton-in-the-Marsh, Gloucester. The group represented a large number of species and varieties, all in large pots. The grace and beauty of well-grown bamboos is generally recognised, and among the most graceful and elegant are Arundinaria aristata, a species not before exhibited; A. racemosa, Bambusa Fortunei, Phyllostachys nigra, a new plant from Japan; P. Quilloi, P. mitis, Bambusa tessellata; Arundinaria Falconeri, a lovely graceful form that is not, however, hardy at Batsford; Phyllostachys Henonis, Arundinaria pygmæa, A. metallica, and A. chrysantha, the last four being very dwarf and handsome. A seedling plant of Arundinaria Laydekeri, produced from seed that had been ripened in the open air at Batsford, was very interesting as probably the first raised in this country. Messrs. J. Veitch and Sons, Chelsea, showed a handsome group of bamboos, their group containing splendid bushy specimens of Arundinaria auricoma, Bambusa Fortunei, B. palmata, Arundinaria nitida, A. japonica, Phyllostachys Kumasasa, &c. These were all splendid plants in fine condition. The Chelsea firm also showed a pretty new single hollyhock, named Primrose Queen, very full and handsome. Mr. Amos Perry showed a few fine gaillardias, Inula ensifolia, heleniums, and fine herbaceous chrysanthemums. Some beautiful waterlilies were shown by Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, and among the finest were Nymphæa odorata rosea, a fine colour; N. tuberosa, a lovely pink shade; and N. sanguinea, deep red. Mr. T. S. Ware showed bamboos, associating them with a few bold and brilliant cannas; B. pumila, B. Quilloi, and B. tesselata were well shown.

C. J. Grahame, Esq., Wrydelands, Leatherhead, gained a silver Banksian medal for a beautiful lot of cut roses, about eight dozen handsome blooms, among which Marchioness of Londonderry, Comtesse de Nadaillac, Ethel Brownlow, A. K. Williams, and Maman Cochet were especially good. This was a good cut of flowers even for so enthusiastic and successful an amateur as is Mr. Grahame. Mr. F. Tapper, Sunbridge Park, Kent, showed a fine soft salmon-red carnation, named Lady Sophie; and Mr. C. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, sent a magnificent broad petalled, deep scarlet variety, named Isinglass.

Messrs. J. Veitch and Sons were once again the only exhibitors of annuals and biennials in competition for the Sherwood Cup, and it appears as though this firm is to be allowed a walk over. Godelias, linums, stocks, tagetes, sweet peas, gypsophila, and clarkias were especially fine and bright.

The Floral Committee made the following awards. *Gold Medal* to Mr. J. Garrett, gardener to A. B. Freeman Mitford, Esq., Batsford Park, for bamboos. *Silver-Gilt Flora* medal to Messrs. J. Veitch and Son, for bamboos. *Silver Gilt Banksian* medals to Mr. H. B. May, for ferns; and Messrs. R. Wallace and Co. for liliums, &c. *Silver Flora* medals to Messrs. Dobbie and Co for sweet peas; Mr. R. Hyffman, for caladiums; Messrs. W. Paul and Son, Waltham Cross, for roses; and Messrs. H. Cannell and Sons, for cacti. *Silver Banksian* medals to Messrs. J. Veitch, for carnations; Messrs. Cutbush and Sons, for hardy flowers; Messrs. Barr and Sons, for hardy flowers; Mr. T. S. Ware for bamboos and hardy flowers; Mr. Gauntlett, Redruth, for bamboos; Mr. C. J. Grahame, for cut roses; and M. Prichard, for hardy flowers.

ORCHID COMMITTEE.

There were but comparatively few orchids on view at this meeting, but among those exhibited was a magnificent specimen of Odontoglossum coronarium, shown by Mr. Robert Shand, gardener to W. G. Groves, Esq., Holehird, Windermere; the specimen occupied a raft about three feet by over two feet, and carried two enormous spikes, each carrying about three dozen beautiful flowers of immense size; it was probably the finest specimen of O. coronarium ever exhibited; the orchid committee were so delighted with it that they awarded it a silver Flora medal. Mr. H. J. Chapman, gardener to R. I. Measures, Esq., Cambridge Lodge, Camberwell, showed Lælio-cattleya Schilleriana, Cambridge Lodge var., a fine form with a brilliant purple lip. Mr. E. Shill, gardener to G. W. Law Schofield, Esq., New Hall Hey, Rawtenstall, showed a lovely form of Cattleya Hardyana, named New Hall Hey variety; the lip was large, and of a wonderfully fine hue, with golden blotches in the throat. Mr. W. Murray, gardener to Norman Cookson, Esq., Oakwood, Wylam-on-Tyne, showed a beautiful cattleya, C. Lord Rothschild, with two handsome rosy-segmented flowers, with a golden-stained throat to the soft rose-tinted lip.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, sent a few good orchids, notably some pure white forms of cattleyas; good forms of C. gigas and Vanda cærulea were also well shown; silver Banksian medal. Mr. de Barri Crawshay, Sevenoaks, brought a handsome form of Cattleya Gaskelliana named Crawshayana; it has light rose sepals and petals, and an orange stained lip. Messrs. F. Sander and Co., St. Albans, sent Cypripedium Orion, a cross between C. selligerum majus and C. Rothschildianum, a bold form with dark purple stripes and spots. Mr. Jones, gardener to W. C. Clarke, Esq., Orleans House, Sefton Park, Liverpool, showed Cypripedium Mrs. Walter Clark, a bold hybrid obtained by crossing C. Ashburtoniæ expansum with C. Stonei; this has drooping, greenish, and black-purple spotted sepals; a very pale lip with green lines, and a big dark rose coloured lip. Messrs. J. Veitch and Sons, Chelsea, showed Lælio cattleya calistoglossa ignescens, L.-c. Zephyra, a pretty buff-coloured hybrid between Cattleya Mendeli and L. xanthina; L.-c. Lucilia, L.-c. Amesiana, L.-c. Ingrami gigantea, very fine; and Masdevallia Imogen, obtained by crossing M. Schlimi with M. Veitchi.

FRUIT COMMITTEE.

A large display of trained gooseberries and currants was put up by Messrs. J. Veitch and Sons, Chelsea, and many of the visitors were highly astonished at the wonderful crops carried on comparatively small standard, goblet-shaped, fan-shaped, and cordon-trained specimens. About fifty varieties of gooseberries were on view, and about the best croppers were Coiner, yellow; Broomgirl, yellow; Whitesmith, Forester, red; Whinham's Industry, Langley Beauty, and Langley Gage. Dessert currants of good growth and crop are Red Champagne and White Crystal. The firm also showed some well-grown nectarines in pots, the variety being Precoce de Croncels, these carrying fine fruits ripened without heat; silver Knightian medal. Mr. W. Allan, Gunton Park Gardens, sent two-year plants of Lord Suffield strawberry to show its value as a late variety, a value fully recognised. Lettuce and turnips from Chiswick Gardens were shown, and some awards made at the gardens were confirmed. Mr. W. H. Divers, gardener to the Duke of Rutland, sent boxes of splendid fruits of Waterloo, Gunton Park, and Dr. Hogg strawberries. The Messrs. Laxton Brothers, Bedford, showed a basket of the fine Trafalgar strawberry referred to in our last issue; they also sent two fruiting plants of the new Fillbasket strawberry, a most prolific variety raised by crossing Latest of All and Royal Sovereign; a white-fleshed highly-flavoured mid-season variety. Mr. W. Carmichael, Edinburgh, sent a number of strawberries bearing somewhat small fruits, but evidently of high flavour, judging from the rate at which they disappeared. Messrs. Wright Brothers, Mansfield, showed a fine new pea named Mansfield Show, a fine cropper. Mr. H. Eckford, Wem, Salop, showed finely-cropped haulms of Rex, Wem, and Monarch, culinary peas, all splendid stocks.

Mr. W. Johnson and Son, Boston, Lincoln, sent about fifty dishes of finely developed culinary peas, and among them we noted especially fine examples of Duke of Albany, Prince Edward, Satisfaction, Wem, Captain Cuttle, Telephone, Rex, John Howard, Sturdy, and Heroine; silver Banksian medal. Messrs. T. Rivers and Son, Sawbridgeworth, Herts, showed some magnificent cherries, the fruits of Bigarreau Napoleon, Bigarreau de Schreken, Early Rivers, White Bigarreau, and Large Black Bigarreau being very large; Belgian Purple and Rivers' Early Transparent plums were also wonderfully fine, and were greatly admired; silver Banksian medal, Messrs. J. Veitch and Sons sent a collection of strawberries and cherries, picked fruits, in addition to their bushes and trees; also a new raspberry named Golden Queen. Mr. O. Thomas, Frogmore Gardens, sent nine huge, pale green-fleshed melons, the variety being named Lord Edward Cavendish.

NATIONAL CARNATION AND PICOTEE SOCIETY, July 27.

THE annual exhibition of this society was held at the Crystal Palace on Wednesday, the 27th inst., instead of on July 20 as originally arranged. There were forty classes provided, open only to members of the society, and the value of the prizes offered was estimated at upwards of £200. The season is a very late one for carnations, for even Mr. Martin Smith in his warm Kentish garden at Beckenham had not more than five per cent. of his seedlings in flower at the date of exhibition. The show, however, was a good one, notwithstanding the seasonal difficulties growers have had to contend with. The classes were fairly well filled and the prizes keenly contested in most of them. The table decorations of carnations were not numerous, but rather better than on most previous occasions.

BIZARRES AND FLAKES.

The first prize for two dozen blooms, bizzares and flakes only, and not less than a dozen dissimilar varieties, was won by Mr. Martin Rowan with clear, handsome blooms of J. S. Hedderley, R. Lord, Wm. Skirving, Robt. Houlgrave, G. Melville, Merton, Gordon Lewis, Constance Grahame, Admiral Curzon, Sarah Payne, J. Buxton, Master Fred, Martin Rowan, and Sportsman; the second prize fell to Mr. James Douglas, Edenside, Great Bookham, and the third to Mr. C. Turner, Slough. There were four entries. Messrs. Thomson and Co., Birmingham, secured the chief award in the class for a dozen dissimilar bizarres and flakes, winning with clear examples of Merton, J. S. Hedderley, Gordon Lewis, Guardsman, Master Fred, Vulcan, Sportsman, Lord Salisbury, Magpie, J. D. Hextall, Robt. Houlgrave, and Mrs. May; F. A. Wellesley, Esq., Woking, second; Mr. C. Phillips, Bracknell, third; and Mr. J. Walker, Thame, fourth. There were half-a-dozen entries.

Nine competed for the prizes in the class for six distinct bizarres and flakes, Mr. A. R. Brown, Handsworth, Birmingham, winning with good blooms of Merton, Robert Lord, Evan Edwards, Rob Roy, J. S. Hedderley, and Sportsman; Mr. F. Hooper, Bath, second; Mr. G. Chauncy, Oxford, third; and Mr. J. Loneder, Bristol, fourth. The best six self carnations, one variety, were large specimens of Cecilia shown by Mr. Martin R. Smith; Mr. J. Douglas second with Mrs. Eric Hambro; Mr. C. Phillips third with Regina; Mr. R. C. Cartwright fourth with Niphetos; and Mr. C. Harden fifth with Mrs. Eric Hambro. There were seventeen competitors.

Mr. R. Sydenham, Birmingham, scored for a scarlet bizarre with a fine bloom of Richard Monk; Mr. A. Chater second with R. Houlgrave; Mr. C. Turner third with R. Houlgrave; and Mr. Sydenham fourth with R. Lord. For a crimson bizarre Mr. R. Sydenham led with Master Fred, and was second with the same variety; Mr. Phillips third with J. S. Hedderley, and fourth with the same variety. The best pink bizarre was William Skirving, shown by Mr. R. Sydenham; Mr. Martin Rowan second and third with the same variety; and Mr. Sydenham fourth, also with W. Skirving. Mr. R. Sydenham was first and second for a scarlet flake with J. Wormald, and Mr. A. R. Brown third with the same variety; Mr. C. Phillips fourth with Sportsman. Mr. Martin Rowan led for a purple flake with Gordon Lewis, and was second with George Melville; Mr. R. Sydenham third with Magpie, and also second with that variety. The best rose flake was Merton, shown by Mr. A. R. Brown, who gained second prize with the same variety; Mr. R. Rowan third with Mrs. Rowan; and Messrs. Thomson and Co. fourth with a seedling.

SELF CARNATIONS.

The first prize for two dozen self carnations in not less than a dozen varieties was won by Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, from among five competitors; there were a magnificent lot of blooms, in which there were only five varieties duplicated, viz., Falcon, Exile, Cecilia, Kelpie, and Mr. Gray Buchanan; the other varieties were Helmsman, Mrs. Archie, Norman, Hildegarde, Sir Bevys, Firebrand, Purity, Miss Judith, Harbord, Bomba, Sir Francis Drake, Euchansis, Exile, Cordelia, Joan of Arc, Forfrida, and Friar Tuck; Mr. James Douglas won second prize with handsome unnamed blooms; Mr. C. Turner, Slough, third; Mr. Martin Rowan, fourth; and Mr. A. Smith Downley, fifth. There were seven stands in the class for one dozen dissimilar self carnations, and, in a close competition, Messrs. Thomson and Co., Sparkhill, Birmingham, won first place with lovely and large flowers of Her Grace, Exile, Mrs. Eric Hambro, Seedling, Percy, Seagull, Ruby, Germania, Lady Mary, Nabob, Britannia, and James Douglas; Mr. C. Phillips, second; Mr. A. J. Rowberry, South Woodford, third; Mr. F. A. Wellesley, Woking, fourth; and Mr. H. W. Weguelin, Torquay, fifth. No less than twenty sets of six self carnations were staged, and in this competition Mr. A. R. Brown gained first place with good examples of Royalty, Mrs. Eric Hambro, Miss A. Campbell, Mrs. J. Douglas, Negress, and a white seedling; Mr. W. Garton, jun., Woolston, second, with a good set; Mr. R. C. Cartwright, Birmingham, third; Mr. A. Chartarin, Edgbaston, fourth; and Mr. C. Harden, Dover, fifth.

Mr. R. Sydenham led for a white self with Mrs. Eric Hambro; Mr. J. Douglas second and fourth, with The Briton; Mr. R. Sydenham third, with Cristobel. The best rose or pink self was Exile, shown by Mr. R. Sydenham; Mr. A. R. Brown second, with Royalty; Mr. Weguelin third and fourth, with Perfection. Among scarlet selfs, Mr. Weguelin was first with Mrs. J. Douglas, and third with Lady Hindlip; Mr Douglas third, with Cadiz; and Mr. A. R. Brown fourth, with Mrs. J. Douglas. The best marone and purple carnation was Uncle Tom, shown by Mr. A. R. Brown, who also was second with Mancunian; Mr. J. Douglas third, with Lablay; and Mr. Foulkes fourth, with Mephisto. For a yellow self Mr. A. R. Brown scored with Miss A. Campbell; Mr. J. Douglas second, with Miss Wilmott; Mr. C. Phillips third, with Regina; and Mr. J. Douglas fourth, with Miss Wilmott. For a buff carnation Mr. C. Turner scored with Mrs. R. Hole; Mr. A. Spurling second, with The Dyak; Mr. Douglas, third and fourth, with Midas.

PICOTEES.

Four stands of two dozen white ground picotees, in not less than a dozen varieties were put up, and the first prize fell to Mr. C. Turner, Slough, who staged clear large blooms of Acme, Favourite (2), Mary, Seedling (7), Brunette (2), Little Phil, Mrs. Gorton (2), Clio (2), Mrs. Payne (2), Madame Richer (2), Mary, and Duchess of York; Mr. James Douglas, second; and Mr. Martin Rowan, third. Messrs. Thomson and Co. secured first prize for twelve picotees distinct, with handsome and very clear flowers of Brunette, Favourite, Medhurst's Seedling, Somerhill, Mrs. Payne, Mrs. Gorton, Mrs. Sharp, Mrs. Openshaw, Miriam, Lady Louisa, Thomas William, and Isabel Laken; Mr. F. A. Wellesley, second; Mr. W. A. Weguelin, third. A dozen stands of six picotees were put up, and from this lot Mr. A. R. Brown won first place with Medhurst's Seedling, Mrs. Beswick, Amy, Harry Kenyon, Amelia, and Mrs. A. Brown; Mr. A. C. Cartwright, second; Mr. C. Phillips, third; and Mr. G. Chauncy, Oxford, fifth.

Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, won first prize for a dozen yellow ground picotees with a magnificent exhibit of blooms of Lily of Duchess, Badminton, Hygeia, Lady Bristol, Dinorah, His Excellency, Wanderer, Duke of Alva, Volage, Vampire, Edith, and Fashion; Mr. C. Turner, Slough, second; Mr. J. Douglas, third; Mr. F. A. Wellesley, fourth; and Mr. Weguelin, fifth. Mr. G. Chauncy, Oxford, had the best six yellow ground picotees; Messrs. Thomson and Co., second; and Mr. S. A. Went, third, out of nine competitors.

Mr. A. Chatwin had the best red-edged piccotee in Isabel Laken; Messrs. Thomson and Co. the best light-red edge in Mrs. Gorton; Mr. R. Sydenham, the best heavy purple edge in Medhurst's Seedling; Mr. A. R. Brown, the best light purple edge in Harry Kenyon; Mr. R. Sydenham, the best heavy rose edge with Madeline; Messrs. Thomson and Co., the best heavy scarlet edge with Mrs. Sharp; and Mr. R. Sydenham, the best light-red edge with Favourite. The best yellow ground was Wanderer, but there was no name to show by whom exhibited. In the maiden class for six carnations and piccotees Mr. J. King, gardener to H. J. Lloyd, Esq., Crondall, was first; and Mr. A. G. Cook, Croydon, second.

FANCIES.

The best dozen fancy carnations came from Mr. A. J. Rowberry, who won from four competitors with examples of Cardinal Wolseley, Ovestes, Seedlings (3), Monarch, Sport, Ceres, Dervish, Ladas, and Phœbus; Mr. C. Phillips, second; Mr. J. Walker, third; and Mr. H. W. Wegeulin, fourth. Four stands of two dozen fancy carnations were staged, and Mr. Martin R. Smith secured the chief prize with grand blooms of Aglaia, Muleteer, St. Gatien, Goldielocks (2), Me Cid, Merry Duchess, Elaine, Renegade, Maid of Honour (2), Zingara, Alexandra, Electra (2), Eothne, Allegra, Hidalgo, Don Carlos, Lord Lieutenant, Guinivere (2), Persimmon, and Fairy; Mr. Charles Turner, Slough, second; Mr. J. Douglas, third; and Mr. A. Smith, Downley, fourth.

Fifteen competitors entered in the class for six fancy carnations, Messrs. Thomson and Co. winning with big blooms of Cardinal Wolsey, Voltaire, Golden Eagle, Monarch, Miss Maud Hill, and Socrates; Mr. F. W. Foulkes, Chester, second; Mr. S. A. Went, Thames Ditton, third; Mr. F. Hooper, fourth; and Mr. W. Garton, jun., fifth. The first prize for six blooms of any one fancy carnation was won by Mr. C. Smith, gardener to Martin R. Smith, Esq., with Hidalgo; Mr. A. W. Jones, Handsworth, second, with Golden Eagle; Mr. J. Douglas, third; and Mr. A. C. Cartwright, fourth. The best single specimen of a fancy carnation was Voltaire, sent by Messrs. Thomson and Co.; Monarch gained second prize for Mr. R. Chatwin; and Eldorado the third for Mr. A. R. Brown.

FLOWERS WITHOUT CARDS OR DRESSING.

Mr. Gorton, jun., won first place for six bizarre and flake carnations, arranged with a spray of foliage with each flower; Mr. J. Loveder, Bristol, second; there were seven competitors. For a dozen selfs and fancies, similarly arranged, Mr. Foulkes, Chester, was first; Mr. Carrington, Chislehurst, second; and Mr. S. A. Went, third, out of thirteen stands. For six selfs or fancies, similarly staged, Messrs. Solley, Walker, and Gillespie secured the awards from twelve stands. For six picotees, arranged with foliage, Mr. F. V. Charrington, Edenbridge, was first, and Mr. Loveder, Bristol, second. For yellow-ground fancies, arranged with own foliage, Messrs. Went, Euston, and Spurling were first, second, and third respectively.

The first prize for a seedling carnation was won by Mr. Charrington with a handsome smooth-petalled, scarlet form named Scarlet Seedling; the same exhibitor was second with Crimson Seedling; Mr. W. Hadley third with a rosy self.

MARTIN SMITH PRIZES.

The best six varieties of self-coloured border carnations, six trusses of each, were shown by Mr. J. Euston, gardener to Mrs. Whitbourne, Great Gearies, Ilford; Mr. G. S. Goble, Ryde, Isle of Wight, second; and Mr. Wegeulin, third. For nine bunches of flake, bizarre, or fancy carnations, Mr. Wegeulin won first prize with strong trusses of bold and fancy-coloured flowers; Mr. Euston second; Mr. J. Walker, Thame, third. The best border variety of self-coloured carnation was Jim Smythe, a handsome, free, scarlet form shown by Mr. H. G. Smythe, Bloomsbury; Mr. J. Collins, second, with Miss Audry Campbell; and Mr. G. Goble, Ryde, Isle of Wight, third, with Duchess of Fife. In connection with these prizes we may remind our readers that competitors have to certify that all the flowers shown have been cut from plants wintered without protection in the open flower border, and they also have to be staged without any kind of dressing.

PREMIER BLOOMS.

The premier blooms on this occasion were as follows: Carnations—bizarre, Admiral Curzon, shown by Mr. Martin Rowan; flake, Flamingo, shown by Mr. J. Douglas; self, Cecilia, shown by Mr. Martin R. Smith; fancy, Hidalgo, also shown by Mr. Martin R. Smith. Picotees—Heavy edge, Clio, shown by Mr. C. Turner; light edge, Sumerhill, shown by Messrs. Thomson and Co.; yellow ground, Mrs. Douglas, shown by Mr. C. Turner.

FLORAL DISPLAYS.

The first prize for a vase of carnations and picotees was won by Mr. S. A. Went, Thames Ditton, with a bold display of mixed colours; Mr. H. Rogers, Woodbridge, second; and Mr. C. Harden, Dover, third. For ladies' sprays there was a keen competition, Mr. C. Smith winning with handsome arrangements; Mr. Rogers, second; and Mr. A. J. Rowberry, third. Mr. Blick also scored for six gents' buttonholes, showing specimen flowers of high quality; Mr. Rogers, second; and Mr. A. J. Rowberry third.

Mr. H. Rogers, Kendlesham, Woodbridge, had the best table decoration in carnations, showing a tasteful arrangement of pale blush carnations, medium-sized blooms, associated with asparagus frondage and myrsiphyllum; Messrs. Motter, Westow Hill, Norwood, second, with a rather too heavy display of crimson and pink flowers.

PLANTS.

The principal award for a group of carnations arranged on a space of [illegible] square feet was won by Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, Beckenham, with a first-rate exhibit of well-grown and freely-flowered plants; Blondin, yellow; Grand Duke, scarlet; Oberon, rose and buff; Queen [illegible], pure white; Saladin, yellow ground, fancy; His Excellency, yellow ground picotee; Goldielocks, yellow fancy; and Boreas, crimson, were among the best in a very handsome collection. Mr. C. Blick also succeeded in winning first prize for a dozen carnations in pots, not exceeding eight and a half inches diameter, showing fine specimens of Saladin, Cordelia, Chieftain, Goldielocks, Golden Eagle, Duke of Alva, Mrs. A. Gilbey, Venus, Endymion, Vesuvius, Sir Bevys, and Her Grace. Mr. J. Douglas, second. For a single specimen Mr. Blick was first, with Golden Eagle; Mr. Douglas, second, with Saul; and Mr. Hadley, third.

Mr. J. Douglas, Bookham, easily won the chief award for a group of carnations arranged on a space of thirty square feet; the plants were splendidly grown, especially the specimens of Saul, Nautch Girl, The Briton, Trojan, and Mrs. J. Douglas.

MISCELLANEOUS DISPLAYS.

Mr. Henry Eckford, of Wem, Salop, showed a grand lot of sweet peas, staging about fifty vases of beautiful and fragrant flowers. Out of this collection we made note of a dozen distinct varieties that are recommendable for all purposes: [illegible] Salopian, rich scarlet; Prince Edward of York, rose and scarlet; [illegible] rose and pink; Captain of the Blues, rich blue; Lady Grisel Hamilton, [illegible] heliotrope; Mrs. Eckford, pale yellow; Prima Donna, lovely rose pink; Countess of Powis, orange-cerise and rose; Little Dorritt, rosy-scarlet and white; [illegible]

Burpee, white; Lemon Queen, soft lemon standard and pale-tinted wings; and Othello, the new and intensely dark variety, deep crimson-purple. Several lovely new forms were shown, such as Duke of Westminster, deep purple-blue; Duchess of Westminster, salmon; and Mrs. Fitzgerald, cream-coloured.

Messrs. W. Cutbush and Sons, Highgate, made a bold display of large bunches of hardy flowers, showing popular varieties. Carnations of sorts were staged rather close down on moss, and in the middle of the group were a fine lot of Malmaison carnations, both plants and cut flowers. Mr. T. G. Foster, Brockhampton Nurseries, Havant, Hants, arrived somewhat late with a fine lot of fresh and fragrant sweet peas, that made up a most charming exhibit; the bunches were large, and the flowers of great substance and brilliance. Mr. J. Douglas, Edenside, Great Bookham, showed a large number of new carnations, selfs, and fancies, some of them being particularly fine in colour and form.

THE PEOPLE'S PALACE HORTICULTURAL SOCIETY.

THIS was the second flower show of the season, and there was a highly creditable display in the Queen's Hall of the Palace, every available spot being occupied. It was decidedly the best summer show yet held, the improvement in culture observed all round was very encouraging. The area of the ground covered by the society, which is somewhat extensive, is divided into two districts, one embracing the more open spots, which are regarded as being better adapted to the culture of plants, and the more densely populated districts where factories abound and the streets are narrower and darker and the gardens smaller. These are known as congested disticts, and although many of those who exhibit cultivate under conditions decidedly unfavourable to successful plant culture, there could yet be observed a steady improvement in the quality of the exhibits.

Groups of plants, which came from the small homely-constructed greenhouses erected by the exhibitors, were arranged on the ground and on tables, the former covering a space of thirty-six feet, and next to the general good quality of the subjects shown was their variety, which the East End gardener evidently appreciates, and he has of flowering plants pelargoniums of various types, fuchsias in variety, nicotiana, lilies, begonias, gloxinias, Marguerites, plumbago, campanula, and others. He has ferns in considerable variety; araucaria, ficus, aspidistra, coleus, an occasional croton, palms, greenleaved dacænas, &c. His dwarf plants on tables are varied also, and cacti can be seen among them; one table group was made up entirely of cacti. The exhibitors grow good specimen plants, both foliage and flowering; the most imposing of the former are Araucaria excelsa, ficus, and aspidistra. Fuchsias and pelargoniums are his leading flowering plants; the quality of the bloom seen on some of the latter, both show and zonal varieties, was remarkably good.

Cut flowers are exhibited in bunches of garden varieties. There were sweet peas, pansies, and violas, and a few baskets of vegetables. There were some very pretty epergnes for table decorations by Mrs. Vince, of Leyton, the different-coloured Iceland poppies being employed with excellent effect, and they stood remarkably well up to the close of the third day.

Some miscellaneous exhibits greatly helped the display. Foremost among them was a large table of beautiful cut roses in considerable variety. Messrs. Barr and Son contributed bunches of cut flowers; from the Duke of Westminster, Eaton Hall, came a very fine lot of Malmaison carnations, set up in Jasper vases, which were greatly admired; Mr. F. C. Hills exhibited from Monkhams an imposing ground group of plants, and M. Ludwig Monk did the same; the Duke of Fife, the president of the society, sent a large group of plants, which filled a table of considerable size; Mrs. Holmes, of the Hampton Park Nursery, a large group of palms, &c.; and Mr. Pritchard, of Forest Gate, a remarkable collection of cacti. All these, being not for competition, were highly commended.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE first Scottish Horticultural Association summer show was held in the Albert Hall, Edinburgh, on July 20. It was so far successful in the number and high quality of its exhibits, and the interest and pleasure of its visitors, that it may prove the beginning of a series of rose or summer shows as successful as the chrysanthemum shows of the association, which have now become the most popular fêtes of the year at Edinburgh. The show this year took the form of an exhibition of roses, strawberries, dinner-table decorations, with the usual liberal contributions by nurserymen and florists, without which no show at any season of the year would be complete. This show had other unique features. No prizes were offered; no charge made for admission, the public being freely invited through the press, and by means of circulars, by post, or hand. A piano discoursed excellent music, a collection being taken in a retiring box, tastefully decorated and placed on a small table, the surplus to be devoted to the garden charities.

Nor does this list exhaust the merits of the show, so skilfully conceived and ably carried through by Mr. Todd, the president, Mr. Lai d, the secretary, and the committee. When the rose show closed a special meeting of the association met to taste and try, and utterly demolish, the feast of strawberries, aided and abetted by cream, so liberally furnished by the growers. Such pleasant meetings can hardly fail to become hardy annuals, or safer still perennial, in Edinburgh and other places, though it may prove useful to remember that there was a rose show in the summer in the Waverley Market, in connection with the Royal Caledonian Horticultural Society, which drooped, languished, and died for lack of financial support. But with rose shows, springing up like mushrooms in all directions, and several Scotch and Irish growers having reached the high level of the Colchester standard, it seems to me that the capital of Scotland should either invite the National Rose Society to visit Edinburgh, or that the Horticultural Association or some other society should organise an annual rose show in the Waverley Market that should at once satisfy the public, and meet the wants and satisfy the legitimate ambition of rose growers. So much for the future. To come to the present show, it has already been said that no money prizes were offered, but the following certificates were awarded for novelty, cultural, or other merit: To Messrs. Thomas Smith and Sons, Stranraer, for a fine display of roses, and a first-class certificate for rose Fair Helen, virtually a white Mrs. John Laing; to Messrs. R. B. Laird and Sons, Edinburgh, for a specially rich and varied display on the platform; to Mr. John Downie, Edinburgh, for a fine display on the centre table of choice flowering and foliage plants; to Messrs. Cocker, Aberdeen, for a fine display of roses, irises, and herbaceous plants; to Messrs. Todd and Co., Edinburgh, for a chastely decorated table, furnished with epergnes and small vases, filled lightly with General Jacqueminot and a few pink rosebuds, and Gypsophila; Messrs. Laing and Mather, first class for a crimson variety of Souvenir de la Malmaison carnation; Messrs. Dickson and Co., certificate for Carnation Purple Prince and a new pink James Dinnca; Mr. John Dobbie, Rothesay, for a choice display of forty-eight bunches of sweet peas; Mr. W. Johnstone, for a table bouquet, with a drooping fringe, of twelve distinct varieties of fuchsias; Messrs. [illegible] and Co., for a rich display of ornamental glass vases—the latter [illegible] tastefully filled with Iceland poppies in endless varieties of tints and [illegible] intensified and multiplied many fold by the diverse hued glass vases. A well-merited certificate was also given to Mr. Scarlet, of Inveresk, for a fine example of Duke of York peas, intact in leaf and pod as grown backed up against the wall. The Daisy pea was likewise displayed in the same perfect way, as well as shown in bulk of pods. Messrs. Dickson and Co., Silverton, made a brilliant show of border pinks, tufted pansies, violas, polyanthus, roses, a ruby-coloured veronica, a free-flowering shrub, Hedysarium multiflorum, and the smallest of all the St. John's worts, Hypericum densiflora, also an improved golden elder with cut leaves. Messrs James Grieve and Sons, of Redbraes, had a good display of violas and tufted pansies—pandanus—palms, ferns. Mr. Cuthbertson, Rothesay, had a capital stand of herbaceous plants, including a new double golden evening primrose, a new plant from Oregon—Sidalcea oregona, with tall spikes and pretty pink flowers, and a black martagon lily. Mr. John Downie showed nice plants of the two novelties that caused such a sensation at Ghent—Acalyphia Sanderi, and the curiously-spotted Dracena Godseffiana; also a fine seeding begonia, some six inches across, and a new free-flowering geranium Achievement.

Excellent collections of roses were shown from Aberdeen, Stranraer, Belfast, Broughty Ferry, Helensburgh, and Trinity Grove, with a fine base of Niphetos, and a dozen good hybrid perpetuals. Messrs. Cocker, of Aberdeen, made a fine display in bunches of from three to five and single flowers.

There was a capital show of strawberries, the exhibitors including such good growers as Mr. Dunn of Dalkeith, Mr. Smith of Hopetown, Mr. McIntyre of The Glen, Mr. Smith of Oxenford, Mr. J. Kirk, of Norward, Alloa, Mr. J. Napier, Dunkeld; Mr. M. Temple, Carron House, Carron; Mr. Matheson, Corrie Hill; Mr. Comfort, Broomfield; Mr. Mackenzie, the Grove; Mr. George Wood, Oswald House; Mr. M. Thinley, Inveresk, with twelve fine dishes of Royal Sovereign from Blackford Park. The Royal Sovereign to a large extent dominated the show, though other old and new varieties were shown in fine condition. The berries most admired were probably the Royal Sovereign and Scarlet Queen, from Dalkeith Palace, the Duke of Edinburgh, from Corrie Hill, and Glen Diamonds, from the Glen. Other growers already named, notably Mr. Temple of Carron, Mr. Kirk, of Alloa, Mr. Mackenzie showed the following sorts remarkably well: President, Duke of Edinburgh, Latest of All, Bicton White Pine, Garibaldi, Noble, Princess of Wales, Queen of Denmark, Royal Sovereign, James Veitch, etc. To give an idea of the interest taken in this the second strawberry exhibition of the Scottish Horticultural Association, it may be mentioned that Mr. Dunn, Dalkeith, contributed the following varieties in eighteen baskets of fruit—the Idle Boy, said to be a Monarch local seedling; three dishes of James Veitch, Royal Sovereign two, Scarlet Queen two, Garibaldi two, British Queen four, Queen of Denmark, Richard Gilbert, Princess of Wales, then three Carmichaels, Duchess Perfection, white and red Alpines.

NATIONAL CHRYSANTHEMUM SOCIETY.

THE annual outing of the members and friends of the above society took place on the 25th inst., a large party leaving Liverpool Street by the twenty minutes past ten a.m. train for Harwich, where they received an accession of friends from Colchester, Ipswich, &c. At one o'clock the party, numbering about one hundred and seventy, sat down to dinner in a spacious tent erected in the rear of the Great Eastern Railway Hotel, Mr. T. W. Sanders, the chairman of the committee, presiding, a substantial and well served meal being heartily enjoyed. After dinner the party went on board one of the company's saloon steamships, and having rounded the Belle Buoy, proceeded up the River Orwell, the richly wooded scenery on the Essex and Suffolk sides being seen at its very best. A landing was made for one hour at Ipswich, a considerable portion of the company taking advantage of the opportunity to inspect the extensive works of Mr. William Colchester on the banks of the river, where they were most hospitably entertained, ample refreshments being provided. Soon after five p.m., the return journey by water to Harwich was made, where an ample meat tea was served at the tent, the interval between tea and the departure of the train to London being occupied in a perambulation of the town. Liverpool Street was reached between eleven and twelve o'clock, and all appeared to have thoroughly enjoyed one of the most successful and enjoyable outings yet undertaken. Great credit is due to the manager of the Great Eastern Railway Hotel and his staff for their excellent arrangements throughout. The weather was agreeable, a pleasant breeze from the sea tempering the summer heat, the sky being overcast during the hottest part of the day.

HORTICULTURAL CLUB.

THE annual excursion of the members and their friends took place this year under the most favourable circumstances, and its success was mainly owing to the exertions and kindness of Mr. Harry J. Veitch. A large party assembled at the Great Western Station at Paddington at ten o'clock, on the 19th inst., and were conveyed in a saloon carriage to Slough, where brakes awaited them, and were driven first to Stoke Pogis, in the churchyard of which village the poet Gray lies buried, and where he wrote his "Elegy." The church is prettily situated in Stoke Park, and the members, through the kindness of Mrs. Bryant, had an opportunity of viewing the mansion and its contents. They afterwards drove to East Burnham Park, the residence of Mr. Harry J. Veitch, who had kindly invited the party to luncheon. Sir J. T. D. Llewellyn, Bart., M.P., the chairman of the club, thanked Mr. Veitch for his hospitality, and expressed his regret at the unavoidable absence of their secretary. The party then drove to Dropmore, where a sight of the grand conifers was much enjoyed. The return was made through Burnham Beeches, where some time was spent in viewing some of the finest trees, and then, after a stroll through the grounds occupied by these fine old trees, comprising about four hundred acres, the party returned to Mr. Veitch's, where tea was kindly provided for them all, and they left for town at a quarter to seven. It should be added that not only did Mr. Veitch receive them "right royally," as one of the members expressed it, but he took upon himself the whole arrangements, and so well that not a single hitch occurred, so that this, one of the most pleasant and enjoyable outings the club has ever had, will be long remembered by all those who had the pleasure of sharing in it.

MR. JAMES GIBSON, who for several years has been head gardener to A. H. Watts, Esq., Devonhurst, Chiswick, has been engaged as head gardener to W. R. Hudson, Esq., Danesfield, Great Marlow, Bucks. Mr. Gibson has acquired a high reputation as an able gardener, and especially as a vegetable grower and exhibitor. He enters upon his new duties on August 1, and the good wishes of all who know him will go with him.

"CRUEL ONLY TO BE KIND."—Much unnecessary suffering is inflicted under the above excuse. If one is not very well, feels out of sorts, has a touch of the bile, and experiences an unpleasant giddiness, one is immediately told to take some disagreeable medicine. It is kindness in the guise of cruelty we are told. As a matter of fact disagreeable medicines are no longer necessary. Holloway's Pills and Ointment—the world-famed remedies—will soon put one right, and, moreover, they are pleasant and agreeable restoratives to health. Thousands can attest this, thousands have attested it. For disorders of the stomach and liver, take the Pills; and use the Ointment for gout, lumbago, rheumatism, &c.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Southern Counties Carnation Society.—W. G.: We are obliged by the newspaper containing the report of the exhibition of this society, and pleased to learn that the gathering was successful. Had we received the usual intimation we would have made arrangements for reporting the gathering.

Wallflowers from Cuttings.—F. B., Elland: Propagation may be effected by means of cuttings placed in a cold frame or under a handlight until rooted. When rooted plant out in well-prepared ground as soon as possible, so that the plants become established before the winter. The seed should yield you a large percentage of plants true to the parent, but all that differ from it should be destroyed, so that the strain may be properly fixed.

Cyrtopodiums.—W. F., Newcastle: To be successful in the cultivation of cyrtopodiums a high temperature, abundant moisture, and rich compost are necessary. Being stout rooted and strong growing orchids they also require plenty of room, and should be placed in large, well-drained pots, in a compost consisting of good fibrous loam, dried cow manure, and sand. During the period of vigorous growth scarcely too much water can be afforded healthy plants, but after growth is complete a long period of rest is necessary; during this period very little water should be given, but the specimens should be still kept in the East Indian house. We have seen cyrtopodiums flourish during the growing season with the pots placed one-third of their depth in the warm water of a tropical water-lily tank. Cyrtopodium punctatum is the most floriferous and easily-managed of the several species cultivated.

Sulphate of Ammonia.—W. C. A., Chichester: Sulphate of ammonia is a most valuable manure, and its chief source is the gas works, for there it is obtained as a bye-product in the manufacture of gas. Other sources of sulphate of ammonia are iron, shale, coke, and carbonising works. Nitrogen to the extent of from one-half to one and a-half per cent. is found in coal, and during dry distillation at the gasworks this is mostly converted into ammonia, subsequently being passed out in the gas-liquor after the gas has been purified. From this liquor the sulphate of ammonia is distilled. A pure sample should contain 25·75 per cent. of ammonia, but 24·5 per cent. gives a very useful manure. It will thus be seen that so far as fertilisers now in general use are concerned sulphate of ammonia is the most concentrated of those valued for their nitrogen. From one hundred to one hundred and twenty-five pounds per acre is quite sufficient for a dressing, and the larger amount should not be exceeded. As a manure sulphate of ammonia is best applied some little time before it is needed by the crop it is to benefit, to allow the conversion into nitrates. When applied alone sulphate of ammonia should be used a month earlier than one would apply nitrate of soda to produce good results.

Trees with Highly-coloured Foliage.—P. G., Slough: There are a large number of trees with richly-coloured foliage suitable for garden decoration, but as not many are required in any one garden of the extent of your own, we shall mention only those of exceptional merit. These you should make a point of seeing, at any well-appointed garden or nursery, for many are now of a most beautiful colour. In selecting from those with bronze, purple, or crimson leafage, and taking the trees in alphabetical order, the first to obtain attention will be Acer palmatum atropurpureum, a small-growing tree with rich crimson leafage; Waterer's Scarlet Oak; and then will follow the Purple Birch (Betula alba purpurea), Purple Beech (Fagus sylvatica purpurea), one of the best known of the purple-leaved trees, and of strong growth—the weeping form of this beech is also a beautiful lawn tree; Purple Cherry Plum (Prunus Pissardi), a handsome tree of small growth; and the Purple Elm (Ulmus montana purpurea). The trees with golden leafage that can be specially recommended are the Golden Poplar (Populus Canadeusis nova), Golden Oak (Quercus robur concordia), the finest of all the golden trees, Golden Acacia (Robina pseud-acacia aurea), and Golden Elms (Ulmus campestris Louis Van Houtte and U. Dampieri aurea), both of which are so good as to closely approach the Golden Oak in merit.

Plants for Indoors.—G. B., Enfield: As you have a small greenhouse and conservatory, you will be able to manage a considerable number of plants suitable for home decoration by keeping them indoors for only a week or two at a time. Especially desirable are Corypha australis, Cocos Weddelliana, Kentia Belmoreana, Latania borbonica, and Rhapis flabelliformis, which comprise the best of the palms for decorative purposes generally; Araucaria excelsa, one of the most elegant and accommodating of greenhouse plants when in a small state; Dracæna australis and D. congesta, two handsome green-leaved forms, India-rubber plant (Ficus elasticus) and Aspidistra lurida, and its variegated variety. These latter are two of the most accommodating plants we have, and are easy to grow and difficult to kill. The best ferns for growing indoors are Asplenium bulbiferum, A. diversifolium, A. flaccidum, Pteris cretica, and P. tremula. The chief points in the management of plants in dwelling-rooms are to give them as much light as possible, to keep the foliage clean by sponging or syringing, and to supply moderately with water. It is essential also to their growth that no water be allowed to accumulate in the vases containing the pots. Several Bamboos, Japanese Maples, the Arundos, Eulalias, and Phormium tenax also are excellent plants for house decoration when at their best.

Names of Plants.—J. L. P., Diss.: Elæagnus longipes.

G. R. I., Chesterfield: Send another and larger specimen; place it in damp (not wet) moss, and in a tin box. Direct it to the Editor, GARDENERS' MAGAZINE, Endsleigh, Priory Park, Kew. See head of column.

M. G., Wimbledon: 1, Leptosiphon luteus; 2, Clarkia elegans; 3, Lepidium sativum.

L. R. J., Norwich: 1, Jasminum Sambae; 2, Clerodendron fallax; 3, Tradescantia zebrina; 4, Panicum plicatum.

A. M., Wanstead: 1, Lilium Browni; 2, L. Martagon; 3, Ligustrum ovalifolium aureum; 4, Lespedezia glomerata; 5, Populus nigra; 6, Nepeta hederacea variegata.

H. C. C., York: 1, Nepenthes Hookeriana; 2, N. Morganiæ; 3, N. Mastersiana.

M. C. Y., Manchester: 1, Melilotus arborea; 2, Robinia hispida; 3, Ruta graveoleus; 4, Semele androgyne; 5, Tropæolum peregrina; 6, Echium vulgare.

R. H., Broxbourne: 1, Sparmannia africana; 2, Schizanthus pinnatus; 3, Gypsophila tenella.

MARKETS.

Covent Garden.

THERE is an abundance of fruit at reasonable rates, while large supplies of green vegetables meet a brisk demand. Salading and potatos also sell well just now.

FRUIT.—English grapes, 1s. to 2s.; Channel Island, 9d. to 1s.; Belgium, 6d. to 9d per lb.; strawberries, 2s. to 4s. per peck; 3s. to 5s. per dozen punnets; cherries, 3s. to 7s. 6d. per half-sieve; pineapples, 2s. to 4s. 6d. each; bananas, 5s. to 10s. per bunch; lemons, 8s. to 15s. per case; French greengages, 10d. to 1s. 3d. per box; 3s. to 3s. 6d. per pad; gooseberries, 3s. to 4s. per bushel; French peaches, 10d. [illegible] 1s. 3d. per box; English, 2s. to 8s. per dozen; green figs, 1s. to 2s. per dozen; raspberries, 3s. to 5s. per dozen punnets; English tomatos, 4d. to 5d.; Jersey, 3d. per lb.; Spanish, 1s. to 1s. 3d. per box; red currants, 3s. to 5s.; black, 5s. to 6s. per half-sieve; Spanish melons, 9s. to 12s. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 2s. to 5s.; red roses, 1s. to 4s.; cattleyas, 6s. to 9s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 3s. to 5s.; stephanotis, 1s. to 2s.; lily of the valley, 6d. to 1s.; [illegible] gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Lettuce, 6d. to 9d. per doz.; cos, 1s. to 1s. 6d. per score; [illegible] onions, 1s. 6d. to 2s. 6d. per dozen bunches; ports, 5s. to 6s. per case; marrows, 2s. 6d. to 4s. per dozen; peas, 1s. to 1s. 6d. per bushel; 2s. to 3s. per bag; French beans, 3s. to 4s. per flat; broad beans, 1s. to 1s. 6d. per bushel; parsley, 1s. 6d. to 1s. 9d.; mint, 1s. 6d. to 2s.; carrots, 3s. to 4s.; turnips, 3s. 6d. to 4s. 6d. per dozen bunches; endive, 1s. to 1s. 6d.; cauliflowers, 1s. to 2s.; cucumbers, 1s. to 3s. per dozen; mushrooms, 6s. to 8s. per 12 lb.; potatos, 4s. to 7s. per cwt.

Borough Potato Market.

Supplies continue to arrive in bulk, and as the demand is somewhat slow there is a tendency towards lower prices. English Beauties and kidneys, 3s. 6d. to 4s. 6d.; Snowdrops, 4s. 6d. to 5s. per cwt.

THE WEATHER DURING THE WEEK ENDING JULY 23, 1898.

WEST'S PATENT
IVORINE PLANT LABELS

THE "IVORINE" WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

Supplied by all Nurserymen, Florists, &c.

The LEEDS ORCHID Co.,
ROUNDHAY. LEEDS.

STANDEN'S MANURE.

TRADE MARK.

ESTABLISHED OVER 30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

Promoting a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

Its highly fertilising properties render its money value, in comparison with other Manures, at least double, very small quantities will produce favourable and lasting results.

ANALYSIS ON APPLICATION.

Sold in Tins, **1s.**, **2s. 6d.**, **5s. 6d.** and **8s.** each, and in Kegs, well secured to prevent loss through exposure, 28 lbs., [illegible] 6d.; 56 lbs., **18s.**; 112 lbs., **32s.**

To be had from all Seedsmen and Florists.

PRACTICAL LANDSCAPE GARDENING
and ESTATE DEVELOPMENT CO.

This Company undertakes to advise as to the laying out of gardens, the general improvement of landed property, and the development of building estates; to provide plans and estimates, and, for a fixed sum, to carry out all work incidental to the making of the smallest Villa garden as well as to the designing and execution of the most extended estate improvements.

It has a staff of experienced foremen, and all necessary plant.

No charge whatever is made for plans, which, however, remain the property of the Company unless the work is carried out by it.

All communications to be addressed to—

THREE INSERTIONS FOR THE PRICE OF TWO!

A MAN WANTS SITUATION in a suburban nursery; low wages would be accepted in return for extended experience in nursery.—E. ELSLEY, 10, Redman Place, High Street, Sevenoaks.

A YOUNG MAN, age 21, WANTS SITUATION as Under Gardener in gentleman's establishment; two years' experience; strong; not afraid of work; excellent reference.—W. P., High Street, Fairford, Gloucestershire.

A GENTLEMAN wishes to RECOMMEND his Head Working Gardener; twenty years' experience inside and out; four and a half years' good character; good chrysanthemum grower; married; age 40; abstainer.—F. A., The Woodlands, Kingston Hill, Surrey.

AS GARDENER (Head Working); married; age 34; twenty years' experience in first-class establishments; well up in all branches; good references.—E. B., 155, Chapter Road, Willesden Green.

ADVERTISER SEEKS RE-ENGAGEMENT as Head Gardener or Gardener and Bailiff; life experience in some of the best places in the country; 14 years last situation; first-class references.—J. LLOYD, Albert Road, Upper Parkstone, Dorset.

AN UNDER GARDENER, age 22, over five years' experience (Inside and Out) in one situation, DESIRES to find WORK under a Head Gardener, who would be willing to teach him the higher branches of gardening; nurseries objected to.—Write, stating wages and duties expected, to his employer, the Rev. E. BORRADAILE, Mere, Wilts.

FOREMAN (Inside or General); aged 26; thoroughly competent, and highly recommended by past and present employers.—J. SCOVELL, Albury Park Gardens, Guildford.

GARDENER (under) SEEKS SITUATION, Inside or Out; age 22; good character; life abstainer; disengaged.—Apply W. SHINER, Milefield Street, Somerset.

GARDENER (Head); age 25; WANTS SITUATION where two are kept; life experience in all branches; well recommended; single or otherwise.—WM. DANIELS, The Gardens, Eastwood Hall, Eastwood, Notts.

GARDENER (Head) where others are kept; life experience in all branches, including orchids and pines; age 34; married, one child; good references; Midlands preferred.—G. F., Church House, Rowner, Gosport.

GARDENER (Head, where three or more are kept); 20 years' practical experience in all branches; age 36; married; total abstainer; six years' character from present place.—W. JONES, Park Homer, Wimborne.

GARDENER (Head), age 31, REQUIRES SITUATION at once; Indoors and Out; two years in Bryanston Gardens; excellent testimonials; abstainer.—HOWARD ABBOTT, Knighton, Durweston, Blandford.

GARDENER (Head Working).—George Robarts, late gardener York House, Twickenham, will be pleased to engage with any lady or gentleman requiring a good all-round man; land and stock if required; age 39; married, no family.—Address 11, Sion Road, Twickenham.

GARDENER (Head Working, where two or more are kept); age 32; life experience in all branches; excellent reference.—SELLWOOD, 24, Manchester Road, Reading, Berks.

GARDENER (Head); age 39; married; experienced in all branches; six and a-half years in last situation as head; left through establishment being broken up; can be well recommended.—Address C. RUSSELL, Clayton West, Huddersfield.

GARDENER (Single-handed, or one under); age 45; thoroughly experienced in all branches; no objection to cows; married; good references; total abstainer.—J. KNIGHT, Gothic Cottage, Lowfield Heath, near Crawley, Sussex.

JOURNEYMAN (Second or Third); Inside in gentleman's establishment; three years' experience; age 19; good character and references; abstainer.—J. REDDING, Holbrook, Ipswich, Suffolk.

JOURNEYMAN (First); age 24; good knowledge of forcing vines, peaches, melons, cucumbers; stove, greenhouse, house decorations; two and a-half years in present place.—J. EDGE, Osterley Park, Isleworth, Middlesex.

MR. COOK, Compton Bassett, Calne, Wilts, wishes to RECOMMEND a Young Man as FOREMAN; 13 years' experience; thoroughly practical and trustworthy.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries. Worcester.

SITUATION as Head Gardener, where two or more are kept; well up in all branches; can be highly recommended; 16 years' experience; married when suited.—W. J. RENDALL, Corndean Gardens, Winchcomb.

WANTED, SITUATION as Second Gardener.—Apply C. BRANDRICK, Six Cottages, Whitley Common, Coventry.

YOUNG MAN, age 24, SEEKS SITUATION in a gentleman's garden as Gardeners' Labourer; good reference.—E. ELDERFIELD, Bonicord Cottage, High Street, Burnham, Bucks.

YOUNG LADY SEEKS ENGAGEMENT in Florist and Fruit Business; thoroughly experienced; excellent reference; age 28.—A. W., Grey's Orchard, Dorchester.

CAN any Gentleman RECOMMEND a capable GARDENER (unmarried preferred), for a Single-handed place, near Windsor; flower and kitchen garden, conservatory, and small forcing houses.—Address "HORTUS," 28, Charles Street, St. James's, S.W.

GARDEN NETTING. — Tanned, Rotless, and Weatherproof, for Protecting Buds and Blooms from Frost and Birds, and Seed in the Ground. No gardener should be without it. 100 yards X 1 yard wide, 3s.; 100 X 2 yards wide, 6s.; 100 X 3 yards wide, 9s. Any lengths and widths from stock. Carriage paid on orders over 5s. value. Lists and samples free.—A. POTTER, Melbourne Netting Works, Wolverhampton. Maker to the Queen and Prince of Wales.

AN AGE OF SPECIALISTS.

20,000 Trained Trees to Select from!
50,000 Apples on Paradise!

For considerably over a century our firm has been noted for the careful cultivation of Fruit Trees, and has built up a reputation by sending out Trees **TRUE TO NAME.** During the past Sixteen Years we have greatly **extended our culture of Fruit Trees,** and, having given up the cultivation of all General Nursery Stock in favour of these, and Roses, we may fairly claim to be **Fruit Tree Specialists.** To-day we are pushing the matter still closer, and make a Speciality (without neglecting other branches of Fruit Tree Culture) of

Photograph from Customer, of Trees planted the previous Autumn.

ESPALIER TRAINED TREES.

Last Season we had a **Stock of over 20,000,** a stock which in excellence or number we believe is without parallel. We have **Apples, Pears,** and **Plums** trained in [illegible] form. **Peaches, Nectarines, Apricots, Cherries,** [illegible] trained Trees. We were the first to grow **Plums** as horizontally trained Trees, a method which suits them infinitely better than any other.

DESCRIPTIVE CATALOGUE, with article on Planting, Pruning, &c., 6d.; Gratis to Customers.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

REFORM OF THE ROYAL BOTANIC SOCIETY.

NOTWITHSTANDING the fact that the results of the movement originated by Mr. J. S. Rubinstein for the purpose of effecting changes in the administration of the Royal Botanic Society which he regards as desirable, have not been very encouraging, that gentleman is evidently steadily following the course he marked out. On Wednesday next the society will hold its annual meeting, when Mr. Rubenstein will take advantage of the opportunity thus afforded for submitting to the Fellows proposals for giving effect to his views. We do not for a moment regard as probable the acceptance by the Fellows of the resolutions of which he has given notice, and although we believe that some changes might be made with advantage to the society, we do not consider it advisable that questions of so much importance should be decided by the small number of Fellows usually present at the annual gatherings. A more unsuitable date, or more inconvenient hour, for the annual meeting could not well have been selected, for a very large proportion of the Fellows have left town by August 10 for the moors, the seaside, or the quietude of their gardens in the country, and the majority of those remaining in town evidently have an objection to attend a meeting at an hour when they usually sit down to luncheon. The charter is, we believe, responsible both for the date and hour, and to make changes in the charter is both troublesome and costly. In the first place, Mr. Rubenstein will recommend that "the present system of electing the members of the council, whereby they are practically elected and re-elected year after year by the council itself, be brought to an end, and that the necessary alterations be made in the bye-laws to give the Fellows a real voice in the nomination and election of members." This question is one on which much might be said on either side, but as the result of wide observation, we are strongly in favour of giving Fellows of societies an opportunity of nominating and electing the members of the governing body. The formation of scientific and administrative branches, with a manager for each, in accordance with another proposal that will be made by Mr. Rubenstein, would probably prove advantageous to the society, but it is doubtful whether a change involving a largely increased expenditure would be expedient at the present time. The formation of classes for the study of botany may or may not be desirable, but before the council acts upon Mr. Rubinstein's suggestion they will do well, in view of the numerous classes already held in the metropolis, to consider whether there is a sufficient demand for further facilities for studying the science to justify the establishment of botanical classes at the gardens. Still greater care will be necessary in considering Mr. Rubenstein's proposal for the erection of a floral hall of adequate size to serve as a winter garden, wherein flower shows, receptions, and musical promenades can be held at all seasons, because the erection of a structure of the character indicated would involve a heavy expenditure, and thereby add greatly to the financial responsibilities of the society, a step which would hardly be regarded as wise at the present time.

HOBBIES.

THE pursuit of a hobby, especially if it be connected with some particular branch of Nature's handiwork, is like working in an inexhaustible mine of precious materials, in which there is the constant chance of something especially precious turning up. Our gardens are the riding grounds of many hobbies, for the general one of gardening for the mere pleasure of growing one's own buttonholes splits itself up into innumerable special hobbies as particular plants absorb the attention and render the grower a fancier. *De gustibus non est disputandum* is especially applicable to hobbies, and every hobby-rider finds far too little enthusiasm evoked by his treasures amongst the majority of his friends. Even the rabid rosarian in leading his enraptured lady friends through his collection of gems often misses the true ring of fine appreciation in the general chorus of "Oh! how lovely!" which greets alike his latest and finest acquisition, and others of which he thinks but little. The fern maniac at, shall we say, the other end of the scale, is also but little elated when his choicest forms of cresting evoke the inevitable reference to parsley, the "Oh! how lovely!" notwithstanding. How often, too, do we see at the special shows of particular plants—cacti, carnations, dahlias, and even chrysanthemums—that the particular differences and delicacies, or it may be, curiosities of the exhibits, are completely ignored except by a small coterie of the hobbyists themselves, the general public contenting themselves with an extra stare at the groups to which prizes have been accorded, and uttering the customary laudatory ejaculations aforesaid, under such guidance only. Yet it is to the hobby-rider that the world owes much of the beauty it enjoys as well as other blessings. It is the man who makes a hobby of a thing who gets below the surface, and by his special study and attention develops the possibilities as well as the actualities. Any man can buy a packet of seed of a good thing, sow it, and with reasonable care deck his garden or his table with the results; but it needed the hobby rider to raise the strain whence the seed resulted, and a hundred generations of growers would do nothing to improve it, unless someone made a hobby of it, studied it crop by crop, picking out the best, profiting by every "break," and so enriching the floral, vegetable, or fruit world with better and better products. It is the same in all branches, the inventor rides his hobby, and in ten thousand different ways adds to the facilities and enjoyments of existence; the physiological student strikes a hobby, potters about, to his friends' disgust, with ridiculous microscopic matters, and succeeds in tracking the fell disease to its origin in tiny black dots of ten thousand to the inch, studies the habits of these little wretches, and knowing these, circumvents them, and down goes the mortality rate with great rapidity as another result of hobby-riding. There are, of course, hobbies and hobbies, and many are purely useless, but this can only be said of mere purposeless collections of odd and incongruous things, and does not apply to the studies of natural phenomena in any of their departments, living or not. Each is replete with Nature's secrets, and it is the hobbyist who finds them out and gives his fellow-men the benefit of his discoveries.

WATER LILIES.

THE meeting of the Royal Horticultural Society on Tuesday should prove of exceptional interest, for the Fellows and other visitors are promised a paper on water lilies by M. Latour-Marliac, who, as the result of his continued and well-devised efforts, has given us a class of these fascinating aquatics in which the brilliant colouring of the exotic species is combined with the robust and hardy constitution of the chaste white flowered species indigenous to the United Kingdom. We do not know whether M. Latour-Marliac will be present to read his paper, but we hope he may be, and should he undertake the long journey that will be necessary to enable him to be present, we trust he will have an audience that will show in some degree how heartily the horticulturists of this country appreciate his efforts in providing material for enhancing the charms of our water scenes. Twenty years ago the hardy nymphæas were limited to six or seven species and varieties, of which one half had white flowers, and the other half flowers coloured yellow, rose or pink; and now, thanks to M. Latour-Marliac, we have a large number, of which a considerable proportion bear flowers rivalling in effectiveness of colour some of the species that are natives of the tropics, and require the protection of glass, and the assistance of a liberal degree of artificial heat for their successful cultivation in this country. M. Latour-Marliac has long taken great interest in the various forms of aquatic vegetation, and recognising the possibilities of the nymphæas, he commenced the work of hybridisation in 1879, but as he crossed the hardy with heat-loving species, th results were not satisfactory. Subsequently he effected a cross between Nymphæa pygmæa and N. indica rubra, and obtained as the result a hybrid bearing bright red flowers, but unfortunately it failed to produce either seeds or offsets, and had to be abandoned. The next cross of which there is record, was effected between our common white water lily, N. alba, and N. flava, an American species with pale yellow flowers, and this resulted in the beautiful hybrid introduced under the designation of N. Marliacea chromatella, and now in general cultivation. This hybrid was followed by N. Marliacea carnea and N. Marliacea rosea, which were raised from N. alba fertilised by the pollen of N. odorata rosea, a handsome form with richly coloured flowers, introduced from Cape Cod, North America. These also are well known and highly appreciated by cultivators of water lilies, and it may be mentioned as a matter of some interest at the present time that the honours which these and other forms brought the raiser at the Paris Exhibition in 1889 encouraged him to proceed with the work in which he had been engaged with so much success. As the result of his later efforts M. Latour-Marliac has been able to give us such magnificent forms as N. Aurora, N. gloriosa, N. ignea, N. Marliacea flammea, N. Robinsoniana, N. Seignoureti, and N. sanguinea, all of which have highly-coloured flowers. As the GARDENERS' MAGAZINE has accomplished so much in extending and improving the cultivation of hardy aquatics, we have much satisfaction in directing attention to the splendid results that have been obtained by M. Latour-Marliac in the hybridisation of the water lilies and the opportunity that will be afforded on Tuesday for obtaining first hand some particulars of the course of procedure by which he has achieved so large a measure of success.

A Botanical Department for the West Indies.—The Government has decided to pay off the deficiency that for some time has been weighing upon several of the West Indian colonies chiefly as a result of depression in the sugar industry. With a view to improving the condition of the West Indian islands that have suffered so much the Government intends to adopt the recommendations made by the recent Royal Commission that investigated the sugar question. It is proposed to establish peasant proprietors by settling the labourers on the land. The partial substitution of other industries for that of sugar was suggested, and in this connection the Government intends to establish a botanical department which shall deal with all questions relating to agriculture, horticulture, and botanic education in these islands. This department is to be placed under the direction of Dr. Morris, assistant director of the Royal Gardens, Kew, and certainly the Government could not have selected a more competent director for the department as none have a wider knowledge of tropical plants of economic value than he, while his former residential experience in Jamaica as head of the botanical department there renders him particularly fit to organise and direct the West Indian Botanical Department. In order to carry out this scheme the Government obtained a vote of £4,500 for this year, the Colonial Secretary stating on the 2nd inst. that in future years a grant of £17,000 would be required. A sum of £5,000 was also voted for a better system of communication between the distressed islands and their markets. The good wishes of all who have the privilege of knowing him will go with Dr. Morris when he leaves Kew, as he shortly will do, to take charge of the West Indian Department; he has already done so much for the Colonies that we are sure he will both deserve and obtain success in his new undertaking.

Prizes for Preserved Fruits and Vegetables are offered by the Royal Agricultural Society in connection with the show to be held at Maidstone next year. Two prizes of £5 and £3 are offered in each of five classes for preserved fruits and vegetables—(1) collection of dried or evaporated fruits; (2) collection of dried or evaporated vegetables; (3) collection of bottled fruits (whole fruit) to be shown in clear glass bottles; (4) collection of preserved fruits for dessert purposes, in boxes or other suitable receptacles; (5) collection of jams, to be shown in 1 lb. clear glass jars. Three prizes of £5, £3, and £2 respectively are offered in each of four classes of cider and perry—(1) cask of cider, not less than 18 and not more than 30 gallons, made in the autumn of 1898; (2) one dozen cider made in the autumn of 1898; (3) one dozen cider made in any year before 1898; (4) one dozen perry. The society also offers a prize of £20 for a machine for the evaporation of fruit and vegetables; and two prizes of £5 for the best system of packing jams and fruit for travelling—(*a*) for soft fruit, (*b*) for hard fruit. Entries for jams and preserved fruit and vegetables close on May 15, 1899; those for evaporators and packing close on April 1, 1899.

Acreage of Market Gardens.—An important change in the form of the returns issued by the Board of Agriculture has been made by the discontinuance of the attempt to give a separate enumeration of the area described as under "Market Gardens." Various facts coming to the notice of the Department had made it evident that for some time much uncertainty was attached to the nominal extent of surface so classified, and no uniform interpretation of the term seemed to be followed. The much greater attention which, in certain neighbourhoods especially, would appear to have been recently devoted to the production of vegetables and miscellaneous crops has led to many of these crops being grown on land which could not be distinguished as technically a garden, and which was often part of the recognised area of the ordinary agricultural holding. Notwithstanding the extension of acreage under this head in recent years, the term "market garden" in its older meaning has been becoming more or less obsolete, and the separation of such areas from less highly-farmed surfaces under the same occupation was often practically impossible. The change has had the advantage of getting rid of some of the difficulties encountered in filling up the schedule as it formerly stood, and, the areas carrying the crops known as market garden produce were always required to be, and are now, separately accounted for under their proper headings, as far as annually distinguished.

A Biological Station at Lake Bologoye, on the Valdai plateau, has been opened about a year or so by the St. Petersburg Society of Naturalists. The lake is shallow, but is quite close to the much deeper Lake Glubokoye. The aquatic vegetation is very rich, while the flora of the district is also rich. In the lakes Najas minor (*Caulinia fragilis*) and N. flexilis (*Caulinia flexilis*) have been found, while on the land such rare plants as Viola umbrosa, Luzula albida, and Botrychium virginianum are fairly plentiful. Four botanists worked at the station during last summer, and the results of their labours have proved most gratifying. The station was established chiefly through the generosity of M. Voronin.

Aster Disease in Kent.—Mr. W. P. Wright, of Fairview, Willesborough, Ashford, Kent, recently sent some specimens of diseased asters to the R.H.S. Scientific Committee, observing that growers of asters in East Kent, especially in the Dover district, are in trouble over an aster disease, which destroys thousands of plants. Some go off directly they are put out, others at a later stage. He found small white grubs in the lower part of the stems, and did not feel any doubt that they were the cause of the mischief. The committee stated that in the *Naturalist*, the organ of the Yorkshire Naturalists' Union, there is a paper by the Rev. Hilderic Friend on this subject. The worms in question are of the family of Enchytræidæ, a group of annelids. Mr. Friend discovered a presumably new form in China asters, and named it E. parvulus on account of its minuteness. A full description of the worm is given in Mr. Friend's paper. There is nothing to be done but consign the plants attacked to the flames.

The Asparagus Rust (*Puccinia asparagi*), which has long been known in Europe, made its appearance in asparagus plantations a few years since, and has spread in North America so rapidly that last year it did a considerable amount of damage to crops in the eastern states. In a badly-infested crop the general appearance is that of an unusually early maturing of the growth. Instead of the healthy green colour there exists a brown hue, as if insects had sucked the plants of their juice or frost had killed them. When examined closely the rusted plants are seen to have the skin of the stems lifted, as if blistered, and within the ruptures of the epidermis a brownish colour, due to multitudes of spores, is noticeable. Like the allied fungi, this species passes through an æcidial or cup stage, and it is important to understand the relation of the cluster-cup to the asparagus rust proper. Experiments carried out at the New Jersey experiment station have shown that spraying the infested plants with Bordeaux mixture has the effect of reducing the amount of rust by about one-fourth. Burning the rusted brush in autumn, as is sometimes done in England and other European countries, was found effective. Even with this precaution, however, many spores must get scattered upon the soil, so that it is well to sprinkle a thin coat of lime upon the ground and leave it there through the winter. By following this up with a turning under of the surface soil in the spring the spores that might still be living are buried and so rendered harmless. The Palmetto variety appears to be less susceptible to attack than other kinds of cultivated asparagus. It fortunately happens that the asparagus rust has a natural enemy in the fungus Darluca filum, which has the reputation of preying upon the rusts generally. This organism imparts to the rusted asparagus a mouldy appearance, the light gray colour being due to the multitudes of fine curved threads that spread out from the more deeply-seated portion of the fungus. Accepting the Darluca as a friend of the asparagus-grower, the latter finds himself in a difficulty, lest in spraying against the asparagus fungus he should, at the same time, destroy his ally. It might, indeed, be a disadvantage to spray asparagus plants that are already enshrouded in a mould by the spores of the Darluca, but this is a point that can only be settled by further experiment.

East Cowes.—On July 20, Mr. S. Heaton, Horticultural Instructor to the Isle of Wight County Council, gave the last of a series of lectures before the members of East Cowes Horticultural Improvement Society. Mr. S. [illegible], J.P., C.C., presided over a good attendance, and briefly introduced the lecturer to deal with "The cultivation of Tuberous, Fibrous rooted, and Rex begonias." The history and general cultivation of the respective kinds of begonias were dealt with in a clear and concise manner. The reasons for the various operations, etc., being fully explained. At the close the Chairman moved a vote of thanks to Mr. Heaton for the course of lectures which he said had been most interesting and instructive.

West of England Chrysanthemum Society has altered the dates of its annual exhibition at Plymouth, from November 1 and 2 to November 3 and 4.

An Agricultural Department at Zanzibar has been established and placed under the superintendence of an English horticulturist, whose duties are to experiment upon and introduce improved methods of cultivation for staple products, and also to introduce plants likely to be of value to the State, to experiment with them, and eventually propagate and distribute such as are found suitable for the climate. Already many trials have been made, and though camphor, [illegible], sarsaparilla, and safflower have failed, there is a promise of good results from cocoa, kola, vanilla, rubber plants, anatto, coffee, and eucalyptus.

The New Water Lilies, raised by Mons. Latour-Marliac, are now fairly well-known to visitors at the Drill Hall and the leading provincial summer shows, where they have been exhibited by some nurserymen, but more extensively by Mr. J. Hudson, gardener to L. de Rothschild, Esq., Gunnersbury House, Acton. By reason of their somewhat high price, these new and hardy water lilies are not yet generally cultivated; but, as they are generally admired, and [illegible] gardeners are anxious to try them, it may be predicted that there will be a large attendance at the meeting of the Royal Horticultural Society, to be held on Tuesday next, August 9, when M. Latour-Marliac is to read a paper on "Water Lilies," a subject with which none are more conversant than he.

The Prune Orchards of Oregon are estimated to occupy about 40,000 acres, about half of them being in bearing. Fifteen thousand acres are situated in the Willamette Valley, a similar area in Rogue River Valley, and six and a-half thousand acres in Umpqua Valley. The good work of the Oregon State Board of Agriculture in respect to insect pests is seen in the general cleanliness and good order of the trees. There was a heavy yield in 1897, but those who carefully handled their produce did very well. Potatos grow well in Oregon, for the 1897 crop was about four and a-half million bushels; the average price paid to farmers was 2s. per cental. It is stated that Oregon farmers can make a profit on potatos at 1s. 2d. per cental.

Messrs. Charles Sharpe and Co., Sleaford, recently took all the men employed in their various establishments to see the Lincoln Agricultural Show; the firm paid all expenses, and the men had a most enjoyable day. On the 21st ult., the Messrs. Sharpe treated their two hundred women and girl employés in a similarly kind manner, but this outing was to Skegness, where the firm made ample provision for the entertainment of this large party. Such outings as these do much to bind employers and employed, creating a sympathy that does not soon fade.

Agriculture and Forestry in Bulgaria are being encouraged by the Government. In the first place, much is being done to introduce a more reasonable system of cultivation, by showing the peasants the advantages to be gained by fertilising the soil, and by the use of machinery of the simpler kinds. Two agricultural schools are maintained at the expense of the Government, one at Sadovo and the other near Roustchouk. Another school intended especially for instruction in fruit cultivation will, writes Vice-Consul Jones, be established during the present year at Kustendil. The wasteful destruction of the forests is now a punishable offence, and the steps taken by the authorities to preserve what remains of the forests have been attended by beneficial results. The peasantry, at first inclined to resist the curtailment of a liberty they had enjoyed under the careless administration of their former rulers, have begun to appreciate the advantages of the new system. The State owns forty per cent. of the forest lands, fifty per cent. being communal property, and the remainder owned by individual proprietors. Nursery gardens belonging, some to the State and some to the various communes, have been established since 1889; they now number more than a thousand. Amongst the trees there cultivated appear the oak, elm, ash, pine, larch, fir, and the mulberry, the latter for distribution among sericulturists. About two million mulberry trees were recently planted in the State nursery-gardens, and, in 1897, twenty-five thousand ounces of mulberry seed were sown.

Artificial India Rubber is being produced both in France and Germany. In the former country resinoline is mixed with zinc, oxide of manganese, and methylated spirit, the whole being kneaded and then compressed. In Germany the process is simpler, jute refuse, or similar textile refuse being prepared and added to oxidized linseed oil, this making a vegetable product that can be put to many of the uses for which the true rubber is in demand.

Mr. Hendon, of Tottenham Park Gardens, met with a serious accident last week when endeavouring to capture a horse belonging to Dr. Hutton. The animal kicked Mr. Hendon in the face, breaking his jaw and otherwise injuring him. Mr. Hendon was unconscious for several days, but is now mending, and it is to be hoped that his recovery will be speedy.

Potatos in many parts of the country are ripening too quickly in consequence of the continued absence of rain, coupled wlth the recent hot weather. On stiff [illegible] potatos are difficult to lift, and the pressure of the baked earth upon the [illegible] somewhat spoils their appearance. So far, the potato disease has not been [illegible] except in one or two of the very moist districts of Devonshire.

Melon Seeds Germinating Inside the Fruits are not exactly rare, [illegible] the occurrence is by no means common. Mr. A. McKellar, gardener to H.R.H. the Prince of Wales, recently sent a melon to Marlborough House, which was subsequently found to be full of young melon plants, quite green, plunging their roots into the flesh of the melon and feeding upon it. Similar growths have also been seen in lemons and oranges, as well as cucumbers, pumpkins, papaws, and other fleshy fruits. The cause appears to be that the fruit has been kept some time in a warm atmosphere.

A Destructive Pea Pest.—The Board of Agriculture has recently issued a leaflet on that destructive pest, the Pea Thrips (*Thrips pisworal*). Many complaints had been heard during the seasons of 1896 and 1897 about damage done to [illegible] by some insect or other. In some cases the damage was found to have been caused by the pea weevil, but in some Kent specimens sent the evil was caused by the presence of thrips. The flowers were dried up and withered, and few perfect pods were found, although the haulm, in these cases, was fully developed. The larvæ had completely arrested the fructification of the flower. The size of the thrip is about a twelfth of an inch when fully grown, and it possesses seven-jointed [illegible] The insect is greyish in colour, the eyes being red, and the mouth [illegible] with a short, fleshy sucking apparatus. The female lays microscopic [illegible] in the midribs of the leaves from which the larvæ come in seven or eight [illegible] at once begin to suck up the juices of the plant. There are many [illegible] during the summer. The following are the remedies recommended: [illegible] of this insect, peas should not be sown in the following year near [illegible] spot. In gardens where peas are trained upon pea sticks it would [illegible] to spray the plants by means of a knapsack machine, but in fields [illegible] are not used, and the foliage grows densely, this would be almost impracticable. The best mixture for spraying would be five pounds of soft soap and the extract of five pounds or six pounds of quassia chips to one hundred gallons of water.

Flower Culture on the Riviera.—At San Remo the flower industry continues to increase, and more and more olives are cut down each year to make way for carnations, roses, and to some extent, vines, especially where ground i available within reach of the high road, so that water for irrigation can be obtained from the mains of the water company. But the flower cultivators complained that owing to the warm summer and continued fine weather of 1897, many of the flowers were ready in advance of the market, and that, therefore, the prices realised were too low to be thoroughly remunerative. At Bordighera the flower trade suffered from enormous over-production, which was specially marked in the autumn of 1897, when the continuous warm weather brought on the flowers very rapidly. The record quantity of flowers sent away from Bordighera in one day was on December 20, 1897, when 1,426 kilos. were despatched. Prices ruled high in the winter, owing to the scarcity of roses caused by the trees being exhausted by the excessive flowering in the autumn. Carnations continue to be planted in large quantities.

Self-Irrigation in Plants is a matter more or less known to all observant horticulturists and agriculturists, but not all have had opportunities of noting the methods by which self-irrigation is ensured over a large series of both native and exotic plants. In an interesting article on the subject in *Knowledge*, the Rev. A. S. Wilson, M.A., observes that many must have noticed how on a wet day in winter the rain runs down the leafless branches and descends the trunks of trees; the bark, in consequence of being kept constantly moist, assumes a green tint from the development of mosses and lichens. During summer, on the contrary, the surface of the trunks and branches of most of our trees is quite free from moisture, and the ground underneath the branches is dry. The foliage, in fact, forms a kind of thatch; the leaves slope outwards and overlap like tiles on a roof, so that the water drips from the outer extremities of the branches, producing a moist zone on the ground around the tree. Now, as the roots commonly extend in a horizontal direction as far as the branches, it is quite obvious they must benefit by this arrangement; and on extending our observations we find this principle to be of very general application. The relative positions of the foliage leaves and absorbent roots are in most cases such as to secure to a greater or less degree the benefits of self-irrigation. The drainage of the foliage may be either centripetal or centrifugal. As examples of the latter, where the slope of the foliage is outwards, may be mentioned the lime, birch, apple, pear, plane, maple, ash, horse-chestnut, poplar, and alder. The needle-like leaves of the pine and larch are also so arranged that nearly all the rain is conducted outwards, the ground underneath the branches remaining in consequence remarkably dry. The drooping or weeping habit of many trees admits of a similar explanation. Palms, bananas, tree-ferns; bulbous monocotyledons like the tulip and hyacinth; the turnip and beetroot, and most plants with tufted foliage, have the drainage centripetal. The radical leaves of the rhubarb, plantain, dandelion, thistle, and many others, are arranged like a rosette, and the rain flows dowh towards the central root-stock. In these cases the stem is either prolonged downwards into a tap-root, or the roots form a central mass of no great horizontal extent. With centripetal drainage several secondary adaptations usually appear. Where the inclination of the foliage is outwards, as a rule the leaf-stalk is not channelled; in plants, on the other hand, which have central roots, there is usually a very conspicuous groove on the upper surface of the petiole. The common cow-parsnip is an exceedingly good example of this; its long petiole has a deep groove above. The raised edges of the groove almost close over it, and practically convert the leaf-stalk of heracleum into a pipe down which the rain flows towards the stem. An instructive contrast is seen on comparing an aroid, such as calocasia or caladium, which has widely-spreading roots and leaves sloping outwards, with the rhubarb, which has a central root-stock, grooved petioles, and inward-sloping leaves.

The Destruction of Charlock.—The destruction of charlock otherwise than by the hoe has been the subject of experiment by the Essex Technical Instruction Committee. A solution of sulphate of copper was used, and in a selected piece of barley, in which an abundance of charlock was making its appearance, the committee last April sprayed it in strips—under various weather conditions and in different stages of growth in order to note the effect—with 1, 2, 4, and 6 per cent. solution of sulphate of copper in quantities varying from 10 to 100 gallons per acre. The weakest solution was found too weak, and the strongest slightly damaged the barley; while 10 gallons were found too little to wet all the charlock, and 100 gallons more than was necessary. A 2 per cent. solution (2 lb. of sulphate of copper to 100 lb., or 10 gallons, of water), applied at the rate of 25 to 50 gallons per acre in dry weather and at an early period in the growth of the charlock, was found completely successful in destroying the weed without injuring the barley. When the report was written the sprayed strips were entirely free from charlock, while the rest of the field was yellow with it; and the barley was flourishing better where the weed had been destroyed than where it was left untouched, thus showing that the solution had in no way injured the cereal.

Messrs. J. Peed and Sons, Norwood, have this season been exhibiting caladiums in especially fine condition at the leading London and provincial shows, and have in the course of the summer gained many high awards that prove how extensive, well developed, and highly coloured the various collections have been. As our columns have testified, the Messrs. Peed have shown many new varieties of merit, both their own and continental productions. At the Hanley Show, held last month, the firm was awarded a gold medal for their caladium group, and not a silver one as inadvertently stated in the report.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

THE sting of the issue of the GARDENERS' MAGAZINE of July 23 lies in the tail, for tucked away on the last page is a note commenting on my "astonishing" reference to a wet spring. *Apropos* of the said sting in the tail, I have so often observed critical paragraphs relating to my humble self cheek by jowl with the market memoranda, that I have grave suspicions of something more than printer's fill-up paragraphs. I am beginning to think it is all a piece of genial humour at my expense on the part of the Editor, who allows me to sail serenely through the pages with a comfortable conviction that all is peace, and then brings me up with a round turn just at the moment when I feel perfectly secure.

But to the criticism. It appears quite evident that I cannot possibly get out of the dilemma into which "South Bucks" has flung me without owning up to where I live. I therefore beg to say that I live in the county of Loamshire. Everybody who has the slightest literary leaning knows that Loamshire has been immortalised by one of our most famous writers. Delightful pictures of the beautiful county have been given. It is a county of great gardens and of distinguished gardeners. (Needless to say, the most distinguished of the latter at the present time is Peter.) We are all proud of Loamshire and the magnificent examples of horticultural produce it sends forth. And now, having obliged "South Bucks," I hope he will oblige me. I want him to send along that "easy proof" of my utter wrongness which he alludes to. His records, however, must not deal with winter. I said spring.

Will that estimable gentleman from the west, Mr. Henry Eckford, accept my respectful congratulations? Agreed. He bows an acknowledgment, and perhaps begs to know what it is all about. Just this. With a shadow of that sly humour which pops little digs at me on the last page, I told a friend who is wildly enthusiastic about the Eckford Sweet Peas, and has a garden full of them, including every procurable variety, that I had an Eckford pea unmentioned by him which would beat the lot of them. He came post-haste to see the radiant floral wonder, and found the pea in the form of a dish of Shropshire Hero smoking hot on the table. His disgust was limitless and profound, but I observed that it did not impair his appetite. May the shadow of Mr. Henry Eckford never grow less! May he go on raising sweet peas as beautiful as Countess of Radnor, and culinary peas as good as Shropshire Hero.

Talking of sweet peas reminds me of another little triumph which Peter and I have enjoyed. After the friend before referred to had finished his dinner he condescended to go into the kitchen garden to look at the peas. His manner betrayed that it was a carnal lapse indulged in to satisfy my gross appetite, but still he did it. On the way he passed a bed brilliant with begonias, and surrounded by a band a foot wide of a certain dwarf plant covered with snow-white flowers. "Oh!" said he, grudgingly, "you can flower that, can you?" I mildly responded that there was an ocular proof of the fact. "That," I must tell the reader, was the White Cupid sweet pea, anent the non-blooming of which so much has been said. He surveyed it with a singular blending of emotions, but would not own that we base culinary cultivators had beaten him.

The credit of the achievement is Peter's, not mine. I drew his attention to the complaints about the plant some time ago, and he read the various paragraphs with great contempt. It was "them paper chaps" again. What could anybody expect from the likes of them? These remarks he delivered with the unspeakable disdain which characterised his attitude a short time ago, when an audacious correspondent likened him to a crested fern. About four months ago he proceeded to action. He procured half-a-dozen cocoa boxes, fitted turves to them, sowed his seed on the reversed turves, and so started the plants. In April he planted them out—of course, without disturbing them in the least—and behold! they are blooming profusely. It is a lesson to observe the air of Peter when his eye falls on this border. The concentrated wisdom of the Bodleian Library could not express one-half as much. Whether there is anything in the practice, or the whole thing is an amazing fluke, I do not know. The border, however, is really beautiful.

I have this week been the recipient of a very flattering compliment indeed. A market grower belonging to another county came here this week, sent by someone who had seen our black currants. He was shown the plantation, and, after taking careful stock of it, said, "Well, if you can grow blacks like that in these days, you're worth thirty shillings a week and a 'ouse to me." He eyed me at this, and observing that I did not jump at it eagerly, added "and coals." Even this magnificent suggestion was unavailing, and his seductive offer fell flat. I afterwards understood that, misled by my very homely garden attire, he had mistaken me for my good henchman. I told him what I have told others, and that is this: If you want healthy black currants you must keep your bushes growing. I used to be frightened of big bud; I am not now. If by surface culture, manuring, and the suppression of old wood, black currants can be kept moving freely they will never be destroyed by mite. I am perfectly well aware that experts declare the healthiest bushes are attacked. I must, however, say that the most virulent attacks which I have seen are in plantations where the culture is not continuous.

The experiment season has commenced. Mr. J. J. Willis sets the ball rolling by introducing the Ontario potato tests to us. We should have been better pleased with the Ontario Department if it had been good enough to tell us what it means by large, medium, and small. I refer, of course, to the "whole set" trials. A large set might mean three ounces, a medium two, and a small one. Or a large set might mean three-quarters of a pound. Apart from this plain fact there is the consideration, truly pointed out by Mr. Prinsep some time ago, that the "medium" set of some sorts is the "large" of others. Experimentalists in Canada seem to have the same unhappy knack as many of the same genus at home—they leave out an essential item, and vitiate the whole thing thereby. More vital to us at the present time is the threatening disease. Have your knapsacks ready, gentlemen, and never grumble about the weight. If Uncle Sam's brave fellows can carry their cwt. per man (see daily papers) under the broiling Cuban sun, and beat the Spaniards, to boot, surely we can tackle Don Phytophthora.

I liked the recent article of "H" on "True Gardeners," in a recent issue, because it breathed a large spirit of human sympathy. It is open to doubt whether the writer wishes to claim that the fewer limbs a follower of the pleasant art possesses the stronger his claims to be a true gardener are. If this were so, we might organise a sort of sliding scale of merit, beginning with the man who has lost a finger or a toe, and ending triumphantly with the one who has nothing left but teeth. On this system of adjudicating claims, I am not sure that I could not give your correspondent a beating, for I know of a humble workman who had lost both legs and one arm in an accident, yet who proved such a terror at gardening that there was not a man in the village who could vie with him. The delight of the one-limbed champion when he showed me his system of planting potatos, namely, by working along his line and making holes for the sets with the stumps which served him in lieu of legs, was good to see. He was enormously proud of it, as well as of many another device by the medium of which he prosecuted his labour of love. Think, good friends, of the magnitude of the alleviation of a terrible lot given by gardening to this maimed hero.

LUX.

NATURAL SOURCES OF NITROGEN.

IT is very important to ask, from an economical point of view, what are the natural sources of nitrogen which are available to plants in Nature, as this element is by far the most expensive ingredient to purchase in artificial manures. We know that the air we breathe is composed mainly of two gases, these are nitrogen and oxygen. Nitrogen is by far the most abundant and forms about 79 per cent. of the whole, that is to say, more than three quarters of the air surrounding every plant is composed of this substance, nitrogen, in a free and uncombined condition. Its importance is shown from the fact that it forms part of every plant that grows, from the tiny bit of moss or algæ, to the magnificent and stately oak. It will be found on analysis to enter into the composition of every plant-organ—the roots, stems, leaves, flowers, fruit, and seed. It is present in every fertile soil, and, in fact, no soil can be productive without an abundant supply of nitrogen.

Ammonia is present in the air, but in very small quantities, and varies in amount in different parts of the earth's surface. It occurs most in the vicinity of large towns, and amidst damp tropical forests. Ammonia gas is given off during the decay of organic matters; it however, does not long remain in that condition, but combines with the nitric and nitrous acids forming nitrate of ammonia; if any portion escapes combination with the nitrates, in combines with carbonic acid and forms carbonate of ammonia; this is especially the case in the vicinity of tropical forests, where the evolution of the carbonic acid from the decaying *débris* is exceedingly large. The nitrogenous food of orchids is believed to be derived from this source.

With regard to the use that plants make of the free and uncombined nitrogen of the air, the conclusions that Lawes and Gilbert have arrived at, after fifty years of research, are that our agricultural and horticultural plants do not themselves directly assimilate the free nitrogen of the air by their leaves; but it would seem that in the growth of leguminous or podded plants, such as the clovers, peas, beans, lupins, &c., at any rate some of the large amount of nitrogen which they contain in their composition, and the great quantity which they frequently leave as nitrogenous residue in the soil for the growth of future crops, may be due to atmospheric nitrogen brought into combination with substances already in the soil under the influence of micro-organisms, or other low forms of plant life that exist in the soil, or in symbiosis—that is, joined with a higher form—thus serving indirectly as a source of nitrogen to higher plants.

For the majority of plants, therefore, the whole of the nitrogenous food assimilated by them in their growth is derived from the soil as nitric acid. The inert nitrogen compounds obtained from the decaying vegetable and animal matters in the soil are practically useless to plants until they have been chemically changed and altered by the process of nitrification, and finally reach the condition of nitric nitrogen, or in other words, nitric acid, which, as before mentioned, is the form most preferred by plants. And not only is the vegetable matter (humus) of the soil thus worked over for the use of future plants, but manure, guano, fish manure, seaweed, shoddy, dried blood, and the various materials used for fertilising purposes, including even ammonia salts, are transformed by nature in that wonderful laboratory which we call the soil, and converted into the compounds best fitted to supply nourishment to crops and individual plants in the open garden, orchard, and conservatory.

In order to show how dependent orchard trees are upon this element of nitrogen, Professor Roberts has computed from analysis that an acre of apple trees (the trees thirty-five feet apart) in twenty years, counting in ten crops of fruit, will require for the growth of leaves and fruit alone 1,337 pounds of nitrogen. To restore this amount of nitrogen would require sixteen tons per acre of a commercial fertilizer containing five per cent. of nitrogen. The depletion of the land by fruit trees is, therefore, more serious than by annual crops, from the fact that plant foods are locked up for many years in the trunks and branches of the trees. On the other hand, it should be said that the roots of trees have a larger foraging area than the roots of smaller plants, so that the exhaustion of the soil is not so quickly shown as when annual crops are grown.

J. J. WILLIS.

Harpenden.

OUT-DOOR PEACH CULTURE.

Under good management, and in a dry situation, there is no tangible reason why excellent crops of peaches should not be obtained in the majority of years from trees grown out of doors, against a south, south-west, or south-east wall. Of course some plants will do fairly well, even though a certain amount of neglect should be meted out to them, but to secure anything like creditable results in the cultivation of peaches out of doors every essential as to their requirements must be understood and put in practice, and knowledge and discriminating powers lie within the compass of the grower. The most important thing to be considered by anyone about to embark on the cultivation of this delicious fruit is a suitable soil for the roots of the trees. The soil should vary according to the aspect and situation. For a dry locality and a wall facing due south a loam of a fairly strong character should be selected. In other aspects, or when the locality is inclined to be moist, a more sandy medium is desirable. In all cases good drainage is indispensable to success, for few plants are more impatient of saturated soil around their roots than peaches. The borders should be thoroughly prepared in autumn or early winter by trenching them to the depth of two feet, and ridging the soil. While the work is in progress old plaster, basic slag, wood ashes, or, if that cannot be had, sulphate of potash should be mixed with the surface portion of the border. Where the staple of the border is a good loam, no farmyard manure should be incoporated with it, as this class of fertiliser has a tendency to promote succulent and unfruitful growths. Very sandy soils, however, will benefit by its presence by making them more retentive of moisture and plant food materials, but the amount employed must, nevertheless, be limited, or more harm than good will result from its use.

Provided the borders have been well prepared in early autumn or winter they should be in a capital condition to receive the trees in spring. The first chance of finding them dry should be taken advantage of to level down the ridges and fork over and break up the soil to the depth of a foot. Small trees are most desirable if they have to be obtained from a nursery, as they receive less of a check from the lifting, packing, and travelling than larger ones do. Thoroughly examine the roots before committing them to their permanent quarters, and dress all those that are mutilated by cutting them in a slanting direction from the under-side towards the surface. By cutting the roots in this manner the young rootlets, which will afterwards follow, will originate on the top—a decided advantage so far as the healthy and fruitful growths of the trees are concerned. The distance between the trees should be determined by the height and length of the wall to be covered. From fifteen to eighteen feet is the usual distance to have the trees apart. Allow a space of three inches between the stems and the wall in order that the stems of the peaches may not come in contact with the latter in after years, and be damaged. The borders in front of wall are invariably utilized for the production of early vegetables, no matter what fruits they have to support to cover the walls, and this necessitates their being manured and dug. This digging destroys all the surface and most valuable roots of the wall trees, and compels them to seek for food in lower and less fertile layers. It will therefore be seen that if well-grown peach trees and good crops are aimed at, this practice must not be put in force.

All the border need not necessarily be given up to the peach trees, as their roots will not occupy it for some years. The better plan, perhaps, would be to be guided by the development of the trees themselves, and when they cover, say, eight feet, vertically, of the wall, leave six feet of the border from their roots undisturbed. The after-management of the soil around the roots of the peaches should be influenced by the health of the plants. When they manifest signs of weakness bone meal and sulphate of ammonia may be applied to the border occupied by their roots during the dormant season of the plants. Wood ash, too, will be found useful when the soil is naturally deficient in potash. As a stimulant when the fruits are stoning, nothing excels equal proportions of sulphate of ammonia and nitrate of soda, applied to the soil at the rate of one and a-half ounce to the square yard, and washed in with warm water. This stimulant will not only aid the trees in finishing heavy crops, but will also enable them to lay up a store of food for the succeeding year. Liquid farmyard manure can likewise be successfully employed to enrich the soil when there is a call for more food, but this essence of plant food is best put on in winter, for then the roots are inactive, and the root hairs dead. One good soaking should be sufficient for loamy soils, but for sandy ones two might be given, leaving a couple of months to pass between the times of application. As farmyard liquid manure will promote organic acid formation in soil [illegible] in lime, a light dressing of it may be necessary twice a year—[illegible], and again about the beginning of June. Although peaches are [illegible] of moisture at their roots, yet they should under no circumstances be allowed to become dry, and to keep the soil in a favourable [illegible] artificial watering may be necessary after a spell of hot, dry weather.

For cultivation in a dry situation in the North Riding of Yorkshire, I have found the following varieties do well, viz., Royal George, Hale's Early, Bellegarde, Dr. Hogg, Early Alexander, Condor, Red Magdalen, and Stirling Castle. In warmer parts of the country, varieties that take [illegible] to mature their crops and growth might be successfully cultivated, [illegible] parts, like some neighbourhoods of Yorkshire, they would be [illegible]. Various are the methods in force for protecting peach and [illegible] early-flowering fruits from frosts and cold, and cutting winds, but [illegible] I like best is that of poles and spruce branches. The poles are [illegible] length to reach from the sloping of the wall to the border [illegible] feet from its base. They are fastened at the top immediately under the coping by hooks, and at the base are tied to posts driven into the border, thus leaving space for the grower. The poles are placed about two feet apart, and on these are tied long spruce branches, well furnished with leaves. The branches are allowed to remain until all possibility of frost is gone, thereby affording protection from any inclement weather from the time they are put on. The leaves of the spruce branches will remain all through the colder months, and when they do fall will do so gradually, and inure the fruit and foliage of the peach trees to light and the natural temperature by degrees. With movable shading the work and care of a year may be lost in a day or night, for, with changeable weather, the promise of a warm, sunny day or mild night may turn into a very cold one, and the shading having been taken off, and not replaced, the growth and crop is crippled. The same amount of disbudding, tying, and the stopping of gross shoots are as essential to good results with outdoor peaches as those under glass, and should be judiciously performed. Disbudding should occupy something like seven days, and be performed in three operations, allowing two or three days to elapse between each time. Remove about one-third of the buds to start with, selecting one at the base of each shoot and the terminal buds to remain. Where there are blanks to fill either among the younger wood or older stems, eyes, suitably placed, should be left to do so. In cases of latent eyes pushing from old stems the growths should be stopped when they are four inches long. By this stopping three or four growths will push from the current year's shoot, and these will be of a much more fruitful character than would have been obtained had the one from the latent eye been allowed to extend unchecked. Lateral growths sometimes push from the young shoots. These should be laid in to fill space when they are required, and not cut away, as is sometimes done, for their presence exhibits too much nitrogen in the soil, and in retaining them a balance between root and branch is secured. In case of a damp, sunless autumn, it is advisable to stop all the stronger growths at the end of August, *i.e.*, if they are still extending, in order that they may ripen.

The chief enemies to peaches and nectarines, among insect pests, are green and black fly, red spider, and thrip. If the branches have a couple of dressings during the winter months of such an insecticide as spidacide, none of them are likely to become troublesome. The time they are most at the mercy of insects is during the flowering period. Nothing can be done to check them at that time, and it is then they do the mischief. It would, therefore, be well to see that none were present just before the peaches came into bloom, and if so, apply a dressing of extract of quassia chips. In the event of red spider showing itself on the trees when in foliage, spidacide and a garden engine or good syringe will exterminate it. It might be desirable to use clean water after an application of this insecticide, not that the insecticide would do harm, but as its action is instantaneous, and what remained on the leaves would not prove any prevention for succeeding attacks. Two doses in one week should effect perfect immunity from insects for a time. Blister is a troublesome pest in some localities, and should be kept as much under as possible. When plants have been affected by this fungoid disease, a good plan is to give them and the walls a good coating with sublimed sulphur and lime through a garden engine. For every pound of sulphur add a quarter of a pound of lime; well mix in water, and make it of the consistency of whitewash. This put on in the winter months, and with some force, to get into all the crevices, will prove of a preventive character. In spring a keen eye will be necessary to detect any leaves attacked, and when found should be at once removed and burned. When the fruit on the peach trees begins to take on colour and approaches ripeness, some fish net should take the place previously occupied by the spruce branches, to keep birds off, for where these are plentiful a crop can soon be ruined through their picking propensities. By following the foregoing items of peach culture out of doors, growers may count on good yields four years out of every five.

J. Riddell.

DISEASED BEDDING PELARGONIUMS.

In your issue of July 9 I observe a reply to A. C. R. Faversham under the above heading. The losses were attributed to "something wrong in the soil," "the application of chemical manures," or foul play. It occurs to me to suggest that the losses may possibly have been caused by the pelargonium disease, which exists in various parts of the country, and often unsuspected. The symptoms of the disease are a gradual withering and shrivelling up of the leaves of the plant. The roots when examined are usually dead; the stem becomes decayed and black below the ground line and for some distance above. After the disease has been at work for some time the plant, if slightly pulled, comes away in the hand, the stem being black and decayed, and roots absent. The disease usually begins to be destructive (when present) shortly after the plants are bedded out, and continues to be a plague till the middle or end of August.

The pelargonium disease is caused, and is spread by the spores of a fungus which attacks the stems of the plant, and which at certain stages may be observed in the form of small blisters like specks on the stem. The best cure I know of is to burn the diseased plants carefully as they are noticed. If the disease has obtained a good hold, it may be necessary to burn the stock of the variety affected, and to put some other kind of plant in the border for a season or two. Some years ago the disease made its appearance here among some plants of Vesuvius I had sent me from a distance. It infected all the stock of Vesuvius, and spread to Henry Jacoby, both of which varieties I did away with, burning the stock and planting different kind of plants altogether where the disease had been for a season or two. I am glad to say we are now clear of the pelargonium disease, but we only got rid of it by drastic measures, and by taking care to burn any plants afterwards which showed any signs of infection. Perhaps my experience may be of use to your correspondent in determining what is the matter with his plants.

Dunrobin, N.B. D. Melville

A GARDEN OF BEAUTY AND BATTLE.

A SHORT time ago the horizon of horticulture was illumined by a new star. In other and more prosaic language, Mr. T. Robinson, head gardener to William Laurence, Esq., Elsfield House, Maidstone, girded himself for battle, went tooth and nail for our leading exhibitors, and, to their consternation and amazement, laid them low. One of the defeated gardeners mopped his brow (and well he might, considering the defeat and the atmosphere), button-holed the present writer, and said, in an injured and aggrieved tone, "I say! Who is this Robinson?" His manner as he propounded the query plainly denoted that he considered it rather cool of a new man to trip him up in that unexpected way, and that he was strongly tempted to give the presumptuous Robinson a piece of his mind. When, however, I informed him that the conqueror's prowess had long been known to a select few, and that, so far from being a new man, he had won hundreds upon hundreds of prizes, the listener drooped his jaw and departed.

There was mirth in the neighbourhood of Hollingbourne when it was known that certain proud exhibitors had mistaken Mr. Robinson for a raw novice. It does, however, sometimes happen that, for various reasons, a man of the highest ability remains comparatively unknown in what are euphemistically called "the leading circles." Like Brer Rabbit, he lies low. The particular moment comes, however, and he emerges from his obscurity, with disastrous results to the unhappy exhibitors who had marked down a certain prize for their own. It is, perhaps, not well known—and, if not, it ought to be—that when this genial Kentish gardener lays himself out for battle the hardest of hard knocks will be given. Whatever he decides to show fight with, from chrysanthemums to onions, will need all the beating the best men can give it.

The first glimpse of the Elsfield Gardens prepossesses the visitor. He bears to the left at the entrance lodge, and before he has gone a hundred yards comes full upon a beautiful border of roses, so that he begins to shake hands with himself at once. The odds are that he will cease that process swiftly in order to finger the roses, for they are splendidly grown and bear thousands of fine blooms. This foretaste of floral charm outside the garden walls is supported within them, for the rule is followed of having all the vegetable quarters fronted with flower borders. Of course, this is not particularly unusual; the same plan obtains in many gardens. But you would have to travel far and visit hundreds of places to see the system carried to such perfection as at Elsfield. Frequently the attempt to floralise the kitchen garden becomes a sort of compromise, taking the modest form of a row of dwarf nasturtium or Virginian stock. But Mr. Robinson has elevated it to a fine art. His borders are six feet or more broad. They are laid out with as much care and kept as clean as though they faced the drawing-room windows. A magnificent display of Sutton's double stocks is a delightful feature of them, and an idea richly worthy of imitation is the establishment of clumps of sweet peas alternately with dahlias. The sweet pea clumps were about a yard through, and—to quote the GARDENERS' MAGAZINE rose phrase—sheaves of beauty.

A good many of the worthy gardener's triumphs have been secured through the medium of this same kitchen garden. His onions are a real picture. I was particularly interested in a grand bed of Cranston's Excelsior, each bulb rapidly approaching the "pounder" stage. The seed was sown at the middle of September, and a finer bed of autumn onions no one need wish to possess. Cranston's is not a first-class keeper, even when spring sown, and it is probable that making an autumn sort of it is the wisest course, for with autumn sown onions, early use and not keeping qualities is the principal end in view. Anyway, there it was, a superb crop. Close beside it was a bed of spring sown, proportionately fine, of other sorts. The size of the bulbs warranted a suggestion of box sowing, but this was denied. Trenching two spits deep and the insertion of two layers of manure form the basis of the practice. The result reminded me of that secured by a cottager, whom I know. He took off his top spit, dug a dressing of fowl manure into the bottom spit, replaced his top layer, and rejoiced in a remarkable bed of onions.

Our Elsfield hero has a significant fact to point out in connection with asparagus. I remarked on the fine appearance of the beds and was informed that they not only looked handsome, but had acted handsomely, by giving the finest cutting for many years. "The only difference in the treatment," remarked Mr. Robinson, "is that for the first time since I have had charge of them the beds have not been salted." Here, gentlemen is a bone of contention for you. Is the time-honoured practice of applying salt to asparagus overdone? Many people think it is. A sound old Kentish gardener of my acquaintance, Mr. G. Tutt, of Ashford, will not hear of salt, and there are not many men who have a better basis of practice behind them than he.

It is too early to talk about chrysanthemums, but not too early to admire a collection of many hundreds of plants, carrying magnificent leafage and glistening with health. It is safe to say that a true gardener will have an open heart for them at every stage of their growth, even before they have their first shift. Along all the beautiful kitchen garden borders at Elsfield, the plants stand in serried ranks, as healthy as thistles in a waste, but telling a very different story. It is easy to see by the glistening eye and loving touch of the grower, how absorbed he is in them. Nay, he must needs shake one out, showing a root system as hearty as that of a well-grown hyacinth, and—what is that above the drainage? So, soot indeed! The happy man smiles complacently. Yes, he has been trying a dash of soot on the crocks, and he is pleased with the result, that is plain to see. If any exhibitor reading these notes has his eye on a certain prize at a London show in November, I beg him not to build his hopes too high. The Robinsonian plants mean business.

It is doubtful if there is a finer lot of peaches in the south of England than those in the Elsfield houses. They are models. The first tree, and one of the finest, is Early York, and not far behind it in merit is Early Louise. I do not know that it would be particularly interesting to give a string of names, but what I feel sure will arrest attention is an idea of Mr. Robinson's with respect to feeding. Be it remarked, in passing, that feeding is feeding in this fine garden. There is, happily, an unlimited supply of water, which is pumped up to a gigantic tank in the middle of the vegetable department. But before the fluid reaches the plants it takes up a dash of something stronger, and assumes an odour which it did not possess before. Well, the idea is to restrict the area of feeding to about three feet from the main stem. I imagine a head-shaking of dissent immediately, and if the head-shaking develops into pen-shaking, I do not suppose the Editor will say "no." Mr. Robinson agrees that the principal feeding roots are not near the stem, but further away. He holds, however, that gross wood follows the feeding of these hungry roots, and that smaller, better-ripened growth is secured by stem feeding.

This hero of a hundred fights shows his master-hand in every department. His grapes are grand, and he shows Black Hamburghs with berries three and a-half inches in circumference. And, as an instance of his versatility, the stages at the front of the vineries are graced with a splendid batch of coleus, magnificently coloured. To see plants of this year's raising two feet high and eighteen inches through in forty-eight sized pots, perfect in health and colour, is to admire unstintingly. In the beautiful conservatory is one of the finest pieces of platycerium in the country. In the bulk it is four feet through, measuring to the tips it is six feet.

Elsfield House is an easy walk from Hollingbourne Station, and a pleasant drive from Maidstone. The generous and respected owner is never averse to anyone with horticultural interests seeing his beautiful garden, and a genial welcome from the head gardener is a certainty.

W. P. W.

PEAS.

THE pea crop, up to the present, has been remarkably good. Though the season being somewhat late, not a few varieties have followed rather too close together. We were quite a fortnight later in gathering than last season. Our first was Chelsea Gem, and it is unsurpassed in point of earliness and flavour. I have given several varieties a good trial this season, but not one was ready nearly so soon as Chelsea Gem. Carter's Early Forcing came next, and this is a very dwarf pea, but with nice pods. That fine pea, Early Morn, was especially good, and well maintained the reputation it gained last last year; another variety sent out by the Messrs. Carter, called Interest, has been especially fine and interesting, for it has grown eight feet with us and has borne a very fine crop of nice-shaped and beautiful green pods and peas; and it is also one of the best flavoured peas of the season. Another variety tried for the first time, is Delicatesse, a fine pea about three feet high, bearing a profusion of large pods and peas of a rich flavour, the pods being extra well filled. The variety, Carter's Seedling has borne the largest pods of any we have had; it is a wonderful cropper, and of a very robust nature, with very stout haulm and a large well filled pod of most delicious green peas; invaluable for table or exhibition.

Exonian has been one of the best second earlies, and is a useful pea that bears a full pod. Duke of Albany is good, but requires change of seed, or, I think, it loses its vigorous nature, and produces pods that are not always full, and then the crop is deceptive. Model Telephone is good, and produces pods of the finest type; Criterion has been good, as also has Veitch's Marrow, containing wonderfully large, highly-flavoured peas. Veitch's Perfection we are now using, and it is very good; Dickson's Marrowfat is a splendid pea of high quality, carrying large, well-shaped pods, and peas of a large size. That old favourite, William I., has done well this season, as also have Champion of England, Ne Pus Ultra, British Queen, Autocrat, Veitch's Sturdy, and Chelsonian. Carter's Michaelmas Pea is looking well, the last sowing being made on July 16, and from this we hope to have good gatherings about Old Michaelmas time. We have now to sow a few rows of Chelsea Gem, and they will about end the pea season.

We have never had better or finer peas than this season has produced, and the varieties mentioned constitute the best of those grown. All our latest peas are sown in trenches, with a good supply of decayed manure beneath, and are well watered at short intervals; but I am much afraid our water supply will give out unless we soon have some rain. The forest trees and shrubs are becoming very much [illegible] and a good, steady rain for twelve hours would benefit everything.

W. A. COOK.

Compton Bassett.

Myosotis dissitiflora.—I was surprised to read in a recent [illegible] of the MAGAZINE that an old and experienced gardener admitted he had been deceived in respect of seed of Myosotis dissitiflora, having had that of M. sylvatica [illegible] instead. Now, anyone familiar with the seeds of these respective species [illegible] at a glance one from the other. Seeds of the former are smaller, and always have prominent white bases, that is the point where originally attached to the calyx. The larger seeds of M. sylvatica have no such prominent marks. I have found seeds of M. dissitiflora to be very cheap and plentiful recently, doubtless due to the fact that the plants when in bloom have escaped injury from frosts. That is the greatest harm which can very well befall this beautiful spring flower. Thus in a garden in which there are plants enough in the spring, were ordinary care taken in saving, a couple of pounds of seed could be saved, and that is a fine [illegible] Still, the cheapness seems due to absence of demand. People go on growing the late sylvatica which blooms in May, when they could have dissitiflora in luxuriant bloom in March and April. Seed is not at all difficult to save, but as the [illegible] lie near the soil a good deal of sandy grit is attached to the flower stems, and the seed is difficult to clean. That is, however, of no moment when saved for home sowing. The best time for this is the middle of August. It is natural [illegible] the plants too early, and that is often the case when self-sown plants are [illegible] as the seed ripens in May and early June. Propagation by cuttings [illegible] ever unsatisfactory, as such raised plants never do so well or bloom so freely as those raised from seed.—A. D.

LEAVES FROM A RAMBLER'S NOTE-BOOK.

"A WAIL OF THE SEASON."

"THE country's full of vermin, and that's the truth," said a hard-working, irritated gardener the other day, folding his arms as he spoke and looking as resigned as he could at a plum tree before him that seemed to be in the sole possession of a legion of aphis. "It's all very well," he went on, "for people to make a fuss about mild winters, saying how pleasant they are and all the rest of it, so they may be in a sense, but my opinion is they're not natural, and the result is that grubs and insects of all descriptions have lived through it instead of being killed, and are now letting us know all about it. There's never been such a season for slugs in my recollection, and it's a fair puzzle to keep them at bay. It's heartrending to see one's plants eaten up as soon as they are put out, and as for the usual preventives, why there's such a host of the pests that they simply laugh at them."

Gardeners, as a rule, are not confirmed grumblers, and when you hear such a wail as the foregoing, with plenty more in reserve, you may depend upon it that the man who utters it is either in a bad temper or else he has a real grievance, and in either case it is well to approach the sore point with caution. Had I not known that the temper of the gardener in question was as good as the majority of his fellows I might have hesitated before opening the conversation, but I, too, was suffering from the effects of patchy vegetable quarters, seeds that refused to germinate, or, having germinated, provided food for some diminutive foe, and fruit trees infested with vermin. To suffer alone and in silence may be fortitude, but it isn't part of the human nature of gardeners, who, when in trouble, prefer to go forth and see how others fare, finding some solace in the sympathy mutual to a pair of fellow craftsmen.

"How have your small seeds come this year?" I asked; this being one of the matters of anxiety. "Come and look," was the reply, and the injured one led the way across the kitchen garden and stopped opposite a carrot bed, where an intermittant growth showed where the rows should have been. "Late, aren't they?" I suggested. "Well, rather; but, bear in mind, it's the third sowing. The first lot never came at all, the second went as soon as they got through the ground, and these are nothing to boast about. I never had such trouble with carrots before, but I hear most people's are the same, if there's any satisfaction in that. Parsnips, too, came up very badly, and as for beetroot, well, I've nearly given that up as a bad job, I've sowed till I'm nearly tired of it." The patchy appearance of the beds was evidence of the truth of the assertion, and from complaints received from different quarters other gardeners could testify to the partial failure of these important crops. Such failures belong to the minor matters that worry gardeners. It does not seem much that a bed of carrots, parsnips, or beetroot should fail, but it means something to the man who has a kitchen to supply, and when these vegetables are demanded he has to own that they are not forthcoming. He may blame the seeds, weather, insects, birds, or whatever he likes, but that does not relieve him of responsibility in the eyes of those who know nothing of the caprices of seasons, and have never had to do battle with the gardeners' enemies. "I never knew what gardeners had to contend with till I took to it myself," said a gentleman to me the other day, who has recently retired from business, and pursues the gentle art as a hobby.

A LITTLE further on was a bed of struggling turnips, tiny dwindling things, trying to look as cheerful as they could, considering that every leaf was in a complete state of perforation. The gardener uttered never a word. He had perhaps got tired of the mention of the name of turnip flea, or else he was too disgusted to refer to the subject again. We looked at the mutilated crop and then at each other. "Mine are just the same," I remarked, and, human to the backbone, he smiled. There was some solace in knowing that he was not the only injured one, and mutual misfortune brought mutual sympathy. "What have you done to prevent it?" I asked. "Everything I can think of," was the emphatic reply, "but they're smothered almost before they get through the ground. If anyone could give us a certain cure for turnip flea they'd be conferring a real benefit on gardeners, for this season it seems to have been almost useless trying to grow them. I've sowed again since we had rain, and they seem a little better now. It seems to me that it's no good people recommending this, that, or the other to prevent flea; you may check it a little if you've got the time to spare, which most gardeners haven't; but I say it's the season, and we must make the best of it;" and having relieved himself of this bit of logic the gardener turned his heel on the turnips. "Peas have done well," he continued a little later, inviting me to run my eye along a well-podded row. "We had a job with the slugs and sparrows to begin with, and between them they spoilt several rows. As I said before, slugs have been a [illegible] pest this season, and I have never known so many. It's been a man's work to watch runner and French beans after they came up, or we should have lost every one. They're pretty safe now. I'm expecting every day that the hawfinches will begin at the peas, as they're fairly numerous about here."

PERHAPS no birds are more destructive among peas than these short-beaked members of the bullfinch tribe, and the rapidity with which they will destroy a row of peas by extracting them from the pods is remarkable. In gardens surrounded by woods they are frequently destructive, and my friend had every reason to fear an attack from the marauders. No doubt there are other gardeners who could say a word about the slug pest. Recently there appeared an article on the subject, and probably the late mild winters have had something to do with the [illegible] of slugs and snails which this season are a nuisance in many gardens. Ever since crops began to grow there has been a general scattering of soot and lime; and, judging from the quantity of devoured plants and mutilated foliage, these old-time remedies have only been partially successful.

I WAS hoping the wail of woe had ended, for I was fully satisfied that I was not the most ill-used person in the world, when I perceived my guide coming towards me with an onion in one hand, and the top of a broad bean stem in the other. "I thought my onions had escaped," he said, "but there's one here gone"; and, pressing the bulb between his thumb and finger, he extracted a maggot. "Broad beans have got it again," he muttered, holding up the other [illegible]. "I must have the tips off at once; that's the best and simplest remedy I know. I thought my onions were safe, though I hear there are a good many about that are spoiled with the maggot. They talk about onions raised under glass and pricked out never getting maggot, but I've seen a bed spoiled with it this season. I tell you it's a regular season for vermin of all sorts; and if anyone has an excuse for grumbling a bit more than usual it's a gardener."

THE subject was changed a little from the vegetable section by the presence of a woolly-backed caterpillar which fell from an overhanging apple tree. Under the ordinary course of nature the creature would have developed into a lucky moth, had it not had the misfortune to drop in close proximity to the gardener's ponderous heel and was crushed to a jelly, while a malicious look passed over the man's face. "Fruit trees are alive with vermin," he went on; "look up there," and at the tips of many of the shoots were masses of web, in which hundreds of wriggling larvæ of the small ermine moth were full of life and vigour. In other places brown and seared tips, with leaves eaten to shreds, showed where the work of destruction had been going on, and the marauders had passed the web state of their existence and escaped. A close look round found the caterpillars crawling about on the ground beneath before changing into their next state. "There was a grand show for fruit, but I think it will be thin now," said my informant. "Pears are nearly all gone, apples are scarce, and I am afraid most of them will be spoiled by the codlin moth. There appears to be a good crop of plums and damsons, but the trees are in a filthy condition." A glance at the trees confirmed this statement, as the leaves were all distorted and wrinkled by the masses of aphis infesting them, though a fairly good set of fruit was apparent. Many weakly-looking apple trees were badly attacked by American blight, and stronger specimens near at hand appeared to be quite free, which seems to point to the fact that this pest either makes it a rule to attack weakly trees or else has the effect of making unhealthy those on which it locates. "You have dressed them, of course?" I suggested. "Several times," was the reply; "but I shan't get fruit enough to pay me for my time and trouble." And this appears to be an argument raised by many fruit growers in respect to washing trees.

MY wail of the season must end here. It has been a grumble from the beginning, but a justifiable one, as it is a true state of affairs in many gardens this season. We have now passed the meridian of summer, and the longest day is behind us, therefore we may review the months of sowing and growing, blooming and setting, that have passed, and hope for the ripening and gathering in. The spring and early summer have been anxious times for gardeners, and it would be interesting to know how that mysterious philosopher, "Peter," has passed through the ordeal. With his quaint knowledge of things in general he has doubtless used that stump of lead pencil in making notes about the enemies against which he wages war.

H.

THE ROSE SEASON OF 1898.

THE remarks made by Mr. Mawley in your issue of last week, page 488, will, I am sure, interest many more than myself, as his experience, which agrees with my own, is no doubt identical with that of many others. To judge from the exhibits of some rosarians, milder climates or sheltered (natural or artificial) situations, have acted favourably to their plants and roses, as they evidently did not suffer so much as I and others, from the north winds, to whose cold blast my garden is greatly exposed. Although Mr. Mawley seems doubtful on the point, the season has most undoubtedly been a late one. In one part of his letter Mr. Mawley says, "I do not think myself that the season has been as exceptionally late as generally supposed," but later on he satisfactorily proves that it has been late by his showing that the exhibits improved in number as the season advanced.

To show how the cold winds and nights affected me, I may say that my standard teas did not begin to bloom until about the 10th of July, and I had no good exhibition flowers off them until about the 15th of the month, having to show at the Crystal Palace and Royal Horticultural Society's show from dwarfs off which I never get good blooms. My best boxes of teas were shown on the 20th and 21st at Leatherhead and Ashstead, where there are no classes for rose competition. I could cut no good dark red roses earlier than I did the standard teas, and my experience of Horace Vernet, A. K. Williams, C. Lefebvre, Earl of Dufferin, and the other first-rate dark reds is that they are infinitely finer in very hot and early seasons than in late ones.

Until this year I thought that a late season might suit my garden, but I am now convinced that if it be accompanied by winds from the north and cold nights, it is fatal to the chance of my plants throwing good bloom. I also think that an early season has the advantage of giving everyone a chance, as in recent years we have had good flowers from the Midlands at the Crystal Palace shows, whereas this year Mr. Machin and others were unable to show a flower.

My view of the exhibits agrees with Mr. Mawley's; the professional growers have shown remarkably well, and the amateurs indifferently. We always expect, and I may say are never disappointed in the exhibits of Mr. Lindsell and Mr. Orpen, although their good fortune in having typical rose soils, and in Mr. Orpen's case a good climate, this year may have materially helped them, but with the exception of their exhibits and those of Mr. Hill Gray's (whom I am delighted to see so well to the front again), I do not think the amateurs were at all in good form this year. However, this was their misfortune, and not their fault, as, like myself, they doubtless could not blame themselves for any want of attention or care for their plants. The experience of other rose growers would be interesting.

Leatherhead. CHARLES J. GRAHAME.

Weeds.—Whilst having the profoundest sympathy with those who would strive to check that wholesale despoiling the rural districts of beautiful wild plants such as it should be our delight to preserve from the greed of the plant poachers, I do all the same wish that our parish councils were armed with compulsory powers to enable them to destroy the coarse noxious seeding weeds which are just now seen in such frightful abundance beside lanes and roads almost everywhere in the country. These weeds become intoleaable nuisances to all who cultivate the land, and they greatly disfigure the roadsides that otherwise would be so delightful. Then I should like to go even further, and see these local authorities armed with powers to compel lazy, negligent farmers or others to have all such weeds in their fields or other land cut down ere they can seed. We are such a stupid people to thus allow as we do this description of weed dissemination to go on all over the kingdom. Very often may be seen on groups of allotments one or two plots covered with seeding weeds doing infinite harm. Weeds should be as ruthlessly rohibited as is the diffusion of animal epidemics.—A. D.

ROCKY MOUNTAINS BRAMBLE.

ALTHOUGH one of the most elegant of the hardy shrubs grown for the beauty of their flowers, the Rocky Mountains Bramble (*Rubus deliciosus*) has not obtained much favour with planters, and, in consequence, it is not met with in gardens except at comparatively rare intervals. This want of popularity is somewhat difficult to understand, for the shrub has a graceful habit, and when allowed to extend freely, as in the case of the fine specimen of which an illustration is given herewith, the large pure white flowers are produced in great abundance, and present a charming appearance throughout the season of flowering. Less robust than some of the shrubs commonly met with in British gardens, this bramble is sufficiently hardy to be successfully grown over a wide area in the United Kingdom, the most essential conditions being a moderate amount of shelter and a friable well drained soil. In the neighbourhood of London and throughout the southern and western counties of England it grows freely and blooms abundantly in fully exposed positions, but in the northern counties the shelter of a wall, fence, or bank is an advantage, as with a little shelter there is no risk of the tender shoots being injured in spring, or of the season's growth failing to ripen satisfactorily. The shrub will thrive in any ordinary garden soil, but one that is rather light is preferable, and where the staple is decidedly heavy it should be improved by a liberal application of coarse grit, such as the sweepings of walks, and leafmould or partly decayed manure. Whether grown in the shrubbery border or against a wall or fence, a considerable latitude should be allowed the growth, and the pruning be limited to the removal in the course of the winter of shoots that have become exhausted. Strong shoots that push from the base should be allowed to remain their whole length, except where they have failed to become well ripened at the tips, and then a small portion only should be removed at the winter pruning. Under the conditions indicated the plants will annually produce a wealth of flowers, and be objects of great interest and beauty throughout the greater part of May. Our illustration represents a specimen growing in the grass department of Messrs. J. Veitch and Sons' nurseries at Coombe Wood, where it is allowed to spread over the outer wall and part of the roof of one of the plant houses.

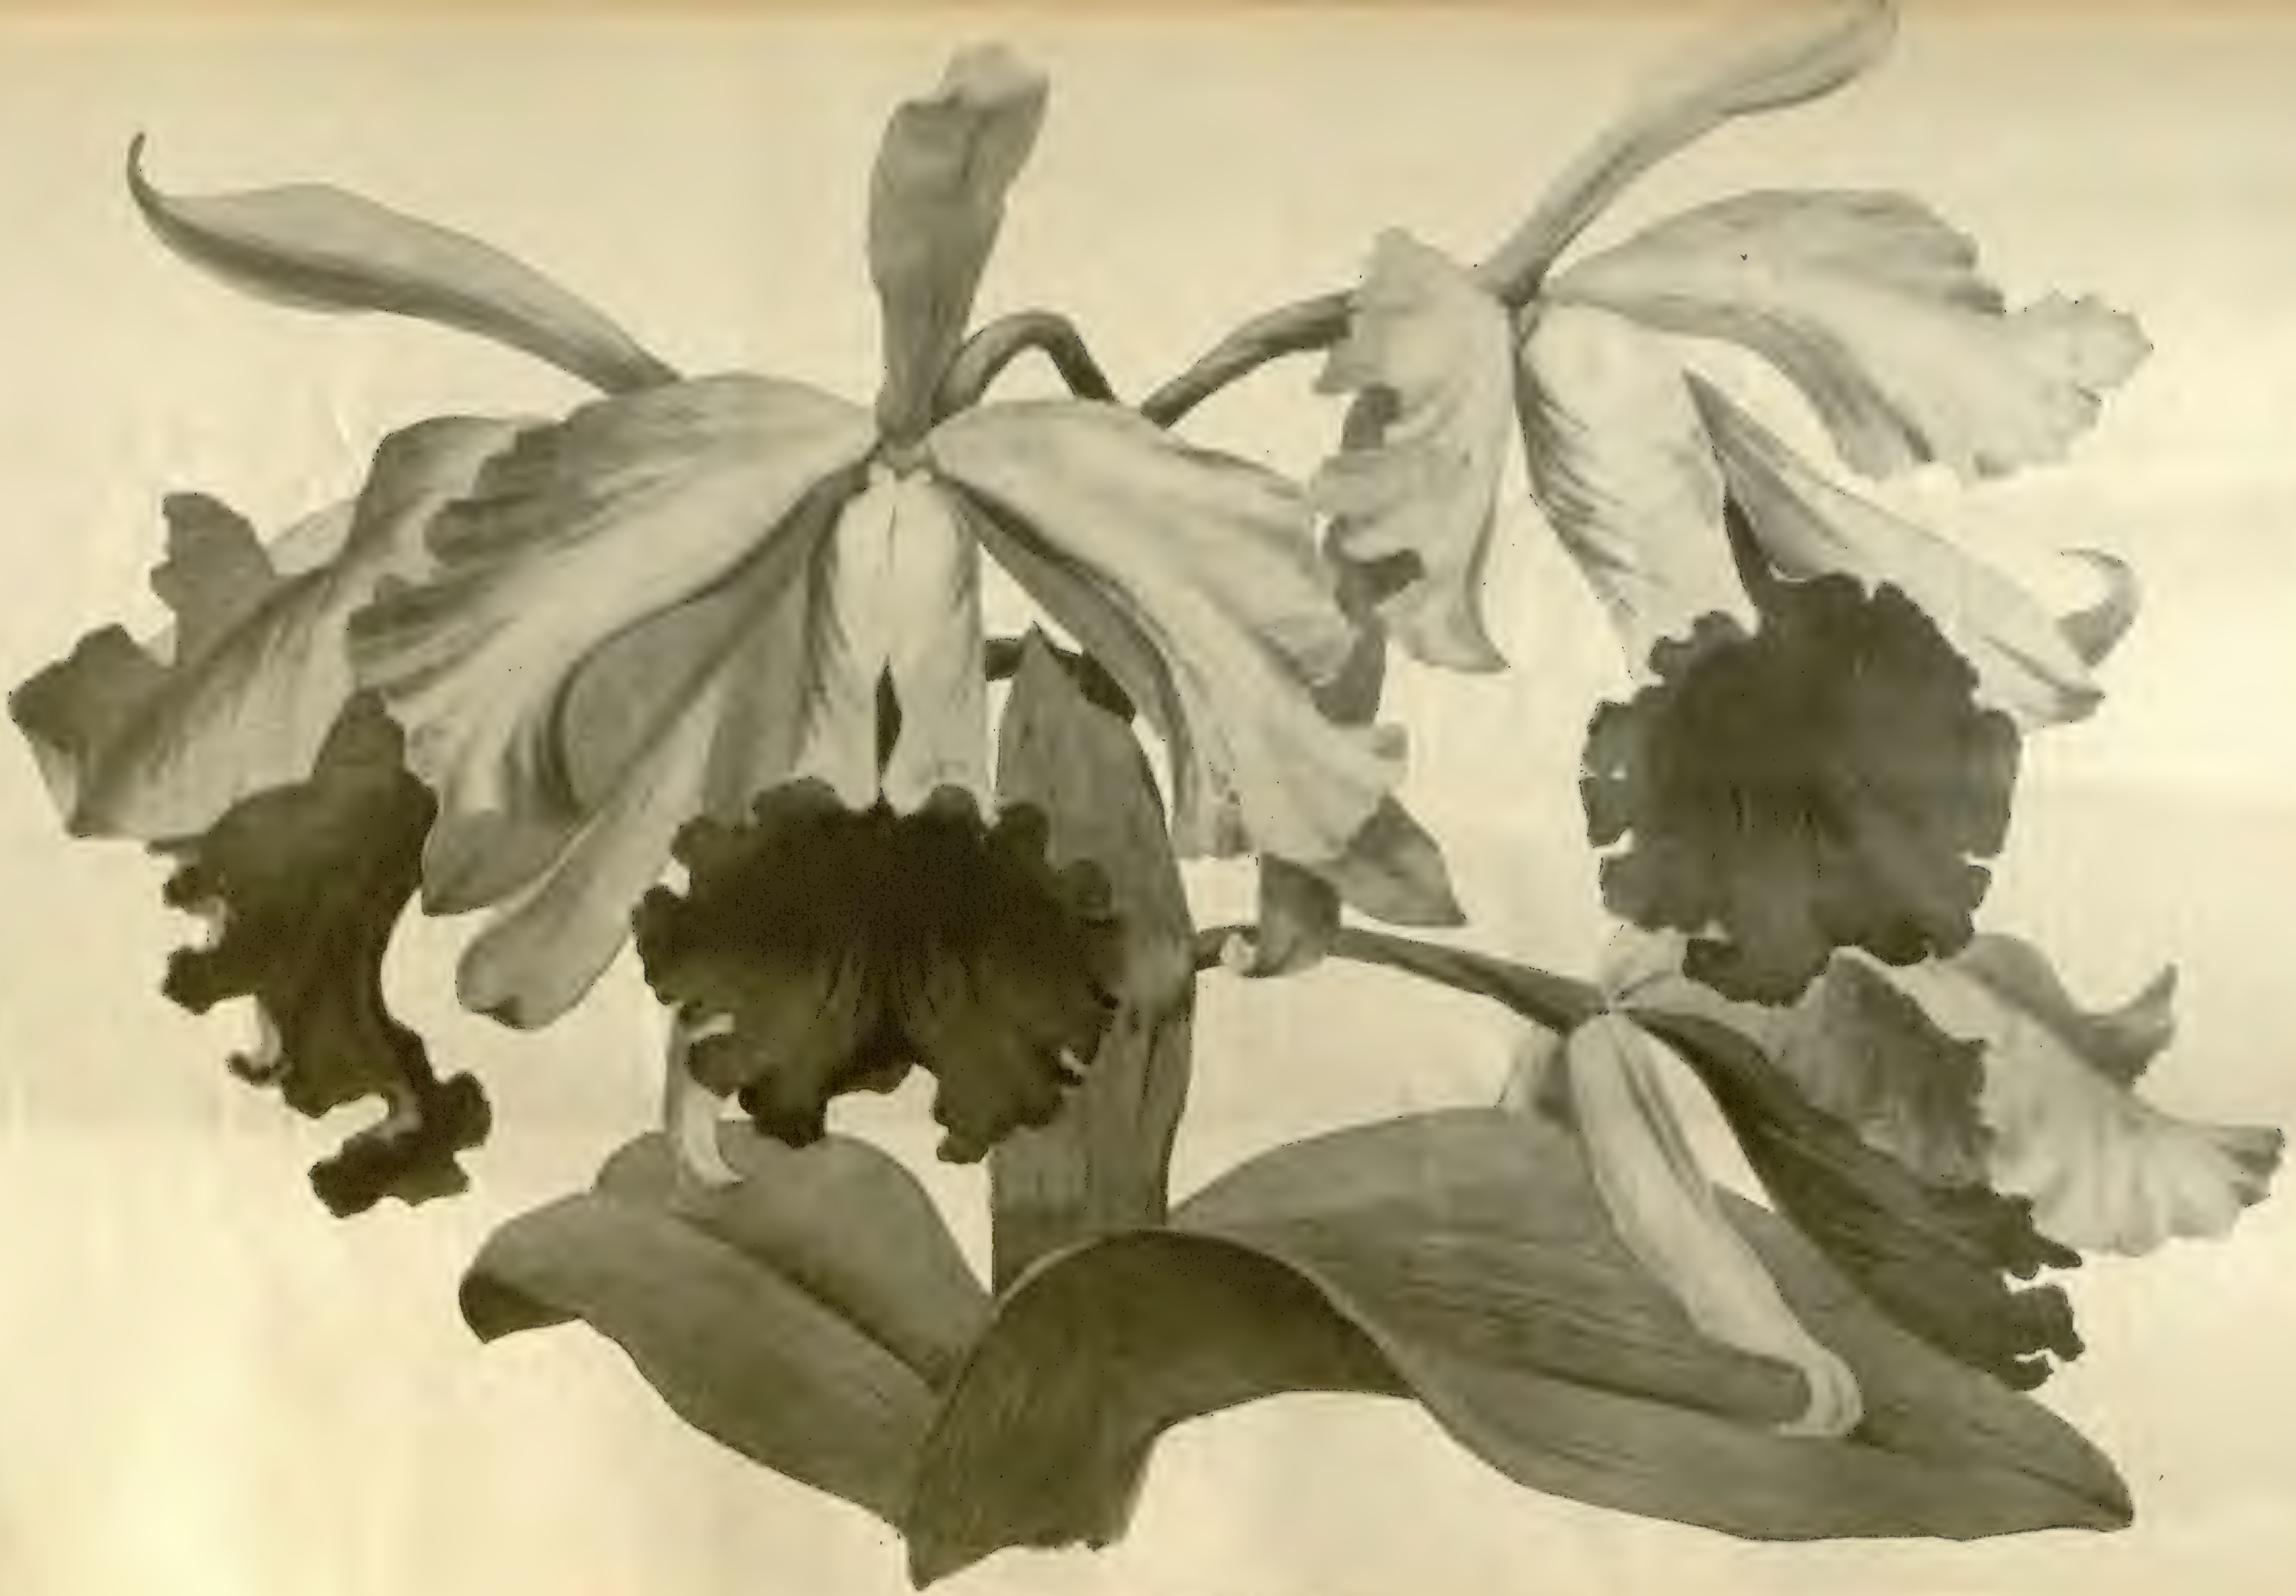
RUBUS DELICIOSUS. (Flowers pure white.)

Rubus deliciosus is by no means a new shrub, for it has been known to science more than three-quarters of a century, and has been in cultivation in this country upwards of thirty years. Early in the present century an expedition was sent to the Rocky Mountains under the command of Major Long, and on its return in 1821 the botanist, Dr. James, brought with him dried specimens of this bramble, which he described as bearing large and delicious fruit. Why the fruits should have been so described it is difficult to understand, except on the assumption that Dr. James did not meet with any other fruits fit to eat, for although they are edible they are not particularly palatable. Dr. Torrey, however, finding that it was a new species, and having Dr. James's note on the size and flavour of the fruit before him, named it Rubus deliciosus. Between the discovery of this bramble and its introduction into this country a period of about forty years elapsed, and for several years after it had become known some doubt existed among horticulturists as to whom belonged the credit of introducing it to cultivation here. It was for some time a matter of common belief that the late Mr. Isaac Anderson-Henry first introduced it, but this was not the case, for Mr. W. Thompson, of Ipswich, had previously obtained seeds from the Rocky Mountains and offered them for sale. The history of the introduction of the shrub is briefly stated as follows: Mr. Anderson-Henry received from an American friend, towards the end of the summer of 1866, seeds that had been gathered from plants growing in the Rocky Mountains in lat. 41; the sowing was made September 29 of the same year, and the young plants began to make their appearance in the March following. Some of the plants bloomed in May, 1870, and the handsome pure white flowers created so much interest amongst the friends of the raiser, who had an opportunity of seeing them, that public attention was soon drawn to the merits of the plant. It was figured and described in the *Bot. Mag.* (*t.* 6062) from specimens supplied by Mr. Anderson-Henry, and there was consequently justification for the belief that the honour of introducing the plant belonged to him. This honour belongs to Mr. W. Thompson, for he offered seed in his catalogue in 1863, and in 1866, the year in which Mr. Anderson-Henry's correspondent sent him seed, he was in a position to supply seed ripened by plants growing in his seed grounds.

At Kew the Rocky Mountains Bramble is grown in beds, and very beautiful is the effect produced when the plants are thus arranged in masses, but in private gardens it appears to the best advantage when planted along the front of the shrubbery, or allowed to spread over a wall or fence. G. G.

LÆLIO-CATTLEYA ADMIRAL DEWEY.

THIS is a particularly robust hybrid orchid, and one that [illegible] freedom of flowering and great beauty with its vigorous habit. The parents of L.-c. Admiral Dewey are a very fine form of the bold Cattleya Warneri and Lælio-cattleya elegans Mastersi. A glance at the accompanying illustration will prove, however, that Lælia [illegible] exercised considerable influence on this, one of its grandchildren. The lip has been glorified and the petals broadened by the influence [illegible] Cattleya Warneri, and the flowers have an erect poise that is [illegible] due to it. The plant was a great attraction at the Temple Show [illegible] last, and made a splendid centrepiece to the group of beautiful orchids staged by Messrs. Charlesworth and Co., Heaton, Bradford, a firm that has raised and introduced a number of charming hybrid [illegible] Already a description of Lælio-cattleya Admiral Dewey has appeared in [illegible] these columns (June 4., page 356), but it may well be repeated in connection with the illustration published now. The sepals and petals [illegible] of a beautiful shade of light purplish rose, the sepals [illegible] and lighter in colour than the wavy petals. The tube of the [illegible] broad, bright rose-purple, with darker veins; inside there [illegible] creamy patches on either side of a central band of royal [illegible] mouth of the lip is fully two and a-quarter inches across, [illegible] waved and crisped margin, and of a grand rich red purple [illegible] though with a lighter wire edge. Four flowers were borne [illegible] shown, and each bloom was over six inches across without [illegible] the segments. The hybrid thoroughly merited the first [illegible] awarded it by the Orchid Committee of the Royal Horticultural [illegible]



LÆLIO-CATTLEYA ADMIRAL DEWEY.

THE FLORA OF AUSTRALIA.

I HAVE often tried to imagine, writes Mr. G. N. Adcock, F.L.S., F.R.H.S., in a most interesting contribution to the *Journal* of the Royal Horticultural Society, what must have been the feelings of Mr. (after Sir Joseph) Banks and his companion, Dr. Solander, as they—the first scientific investigators of living Australian plants—gazed on the enchanting beauty and rich floral profusion which aptly suggested the name "Botany Bay." Fancy an enthusiastic botanist in the present day finding himself in a new land with a flora so unlike that of any other. In attempting even a sketch of our splendid flora, it is with the consciousness that the subject requires an abler pen than mine to do it anything like the justice to which it is entitled. In the "Second Systematic Census of Australian Plants," published in 1889, my esteemed friend the late Baron von Mueller included among the Vasculares 8,839 indigenous species. Of these he gives 7,501 as endemic to continental Australia and Tasmania; so that in round numbers 85 per cent. of our plants are exclusively Australian. The area is, roughly speaking, about 3,000,000 square miles, much of it presenting almost insuperable difficulties to the work of collecting. All zones of plant life are here represented, from the Alpine vegetation to the luxuriant and varied flora of the tropics; and it is a record of which we who have made Australia our adopted home may be reasonably proud that so many species, totally different in so many respects from those included in other and better-known floras, have been so closely observed and so carefully and accurately described. When we consider that there are countries—each with a history going back far beyond the commencement of the Christian era, each the birthplace of generations of eminent scientific men—that have never yet had their floras described as systematically as ours, we cannot but feel the deepest admiration for the scientific genius, perseverance, and research by means of which such splendid results have been achieved. Australian botanical science presents an illustrious roll of indefatigable workers.

It is a matter of great regret that so many of the names bestowed on native plants and animals by the pioneer settlers are singularly inappropriate. Thus "Gum-tree" is the colonial name for all species of Eucalypts. The Banksias are known as "Honeysuckles." Our native "Fuchsia" is a Correa belonging to the Rutaceæ. Exocarpus cupressiformis is the native "Cherry." "She Oak" is the name given to some of the Casuarinas, whose cone-like fruits are called "Oak-apples." Australian "Tea-trees" are members of the order Myrtaceæ, and include plants belonging to the genera Melaleuca and Leptospermum, while "Native Hops" represent various species of Dodonæa and Goodenia, or maybe Daviesia latifolia. And so this list might be almost indefinitely extended. The flora of Australia presents many peculiarities, of which much capital has often been made. Thus our trees are, many of them, peculiar in giving but little shade. Some are leafless. Our Cherry is stated to grow its stone outside the fruit—really on a succulent fruit stalk—while our Pear (*Xylomelum pyriforme*), one of the Proteads, is not only wooden but reversed on its stalk, and our Nettle assumes the proportions of a fair-sized tree up to one hundred feet in height, and so we might go on. The first thing that will probably strike a botanical observer in Australia is the great extent and wide distribution of its forests, composed chiefly of Eucalypts, which form the principal timber vegetation of the continent with perhaps the exeception of some limited areas in the north and north-east. Of these remarkable trees we have over one hundred and fifty distinct species. It is remarkable that none of them are indigenous to the romantic and adjacent islands of New Zealand, nor, indeed, are any of our larger trees also native there. Hence the Eucalypts are typical Australian trees, and like many others in our flora are relics probably of the Eocene age.

In this brief sketch no more than a passing mention can be made of the many species deserving much closer attention for their utilitarian or horticultural value. Individuals of some species grow to be gigantic trees. Eucalyptus amygdalina is said to equal, if not to surpass in height any other tree in the world, not excepting Sequoia (Wellingtonia) gigantea. The latter, however, much exceeds the Eucalypt in the size of its massive trunk. While we must admit that the heights of Eucalypts have been frequently much exaggerated by travellers who have trusted to their imagination rather than to scientific observation, yet reliable measurements have been taken by authentic observers of great heights up to and even considerably exceeding four hundred feet. The Western Australian Karri, (*E. diversicolor*) is another species remarkable for its towering height. But while some are noted for their lofty growth and stately habit, especially in humid forest glens, yet many species are gnarled and dwarf and almost shrubby. The Eucalypts are locally and popularly known under an almost endless variety of names, *e.g.*, blue, white, red, and spotted gum, stringy or ironbark, peppermint, apple-scented, or manna gum, and mallee. It should be remarked that the same popular name sometimes represents a totally different species in a different locality. Bushmen and splitters tell the varieties by the appearance of the bark, which in some cases is shed in long strips, while in others it is persistent, and may be stringy and soft, or hard and rugged, or furrowed. The leaves of some varieties grow to a large size, and are liberally provided with stomata. The majority of species produce leaves tough in texture, full of oil glands, and are suspended on their petioles, so that the edges are vertical—these provisions being doubtless Nature's devices to protect the blade of the leaf from the scorching Australian sun. As aids in the classification of these interesting plants, we may cite the character of the bark as already referred to, the presence or absence of sterile stamens, the arrangement, structure, and dehiscence of anthers, peculiarities of fruit, sections of petioles, and uniformity or otherwise of the number of stomata on the upper and under surfaces of the leaf.

The "Blue-gum" (*E. globulus*) is a lofty tree, remarkable for the quickness of its growth. In some parts of Europe it is popularly called the "Fever-tree" on account of its value in malarial regions. It rapidly absorbs the excessive moisture in marshy places, and freely exhales its valuable antiseptic oil. Its timber is of a very durable character, and as it is of exceptionally rapid growth it has been largely planted abroad. It owes its popular name to the bluish tinge of the waxy bloom that covers the calyces and the foliage of young plants. The "Red-gum" (*E. rostrata*) prefers low lying situations, and may usually be seen near the watercourses in almost every part of the continent. It takes its vernacular name from the colour of the timber, which for its durability in such places as are usually favourable to the rapid decay of timbers has probably only one rival in the Jarrah (*E. marginata*) of Western Australia. The gem of the genus from a horticultural standpoint is unquestionably E. ficifolia. Its strikingly handsome dark green foliage, to which it owes its specific name, forms a fitting contrast to the gorgeous crimson flowers which this magnificent species bears in such profusion. Other brilliantly coloured species are E. miniata and E. phœnicea, both of which yield flowers of a bright scarlet colour. The "Sugar-gum" (*E. corynocalyx*) produces sweetish foliage, which affords food for stock in seasons of drought. Time and space would fail even to refer to the many other meritorious species. In addition to the useful timber, many yield large quantities of the Eucalyptus oil, which is largely and increasingly used in medical practice. The result of a series of elaborate experiments seems to prove that E. amygdalina is far richer in oil than any other species. The Eucalypts claimed our first attention owing to their wide distribution and the immense areas they cover, as well as for their towering height, their economic value, and, in some cases at least, for the unsurpassed beauty of their blossoms. However, in point of numbers the Legminosæ come far ahead, and represent [illegible] 12 per cent. of the flora.

The acacias, numbering some three hundred odd species, make up by far the largest Australian genus. The golden and delicately fragrant blossoms of many of these species are amongst the first to proclaim the advent of spring. They are represented almost everywhere in the continent. Some line the banks, and the graceful pendulous branches of some varieties droop over the waters of many of our inland streams. They clothe the mountain-side, adorn the pastures, grow in the poorest or in the most fertile soil, while some species revel in sandy tracts either inland or littoral. In some of our dense southern forests they form a large proportion of the undergrowth. Even in the arid and desolate interior they are represented, and form in some cases an almost impenetrable scrub that well nigh baffles the hardy and daring explorer in his toilsome advance through those dreary and inhospitable solitudes. From this circumstance some have earned the names of "deadfinish" and "wait-a-while." These local names have been doubtless bestowed on them by travellers who have experienced a disappointing repulse in their onward march by an impassable barrier of the dense growth. Strictly speaking, many species have no true leaves, but are amply provided with phyllodia. Acacias are not without utilitarian value. Several yield a bark exceedingly rich in tannin, *e.g.*, A. decurrens, A. mollissima, while the "golden wattle" (*A. pycnantha*), besides being so attractive to the senses of sight and smell, yields one of the richest barks for tanning purposes in the world. The gum, which is very copiously exuded by several kinds, is used for the same purposes as gum arabic. The delicate perfume of the blossoms has been extracted, and furnishes an agreeable scent. Several species, as A. parvissima, A. cultriformis, and others, possess considerable horticultural merit, and are extensively planted. The timber of the "blackwood" or "lightwood" (*A. melanoxylon*) is one of our most valuable, and is used in cabinet work, railway carriage fittings, and for similar purposes. A. acuminata produces wood whose scent resembles that of raspberries, while the timber of A. homalophylla is violet-scented. Both these species are known as "myall." The parts of the flowers that are conspicuous in our eucalypts and acacias are the parts that are more or less concealed in many of our cultivated blossoms. Included in the same order is a gigantic bean (*Entada scandens*) whose pods are sometimes six feet to eight feet in length. The individual seeds are often hollowed, mounted with silver, and convered into fancy match-boxes. Very many of the papilionaceous section of the Leguminosæ produce handsome flowers, such as Indigofera, Dillwynias, Pultenæas, and Swainsonias. Many of the latter are remarkable for spiral or curved lower petals and beautiful blossoms, but are frequently deleterious. Besides these there are others equally attractive in almost endless variety. But probably none are more charming than Clianthus Dampieri, Stuart's Desert Pea, whose silver-green foliage and large, bright, gorgeous blossoms render it peculiarly conspicuous and attractive.

Next in importance, when we consider the number of species, are the Proteads, than which, perhaps, no order of indigenous plants has greater interest either for the gardener or the botanist. The name bestowed on this order (from the South African Protea of Linnæus) is singularly appropriate, for these plants exhibit a variability which excels even the mutable characteristic for which the mythical sea-god was so remarkable. Probably the commonest and most widely distributed Proteads are the native honeysuckles (Banksia spp.) They owe their singular popular name probably to the fact that they, in common with many other proteaceous plants, yield a copious supply of nectar. While the aborigines greedily suck the flowers to obtain this sweet fluid, yet with Europeans its use is frequently attended with feelings of nausea and headache. Dryandra plumosa is often cultivated for the sake of its large cylindrical flower-clusters and its deeply-serrated and peculiar foliage. Both flowers and foliage of this unique plant will keep almost indefinitely. Of grevilleas there are probably over 160 varieties, but as yet [illegible] about half-a dozen species are in cultivation. These include the stately G. robusta, or silky oak, as it is popularly called. Its immense comb-shaped trusses of large orange flowers render the tree a strikingly conspicuous object in the landscape. These blossoms have sometimes been fancifully compared to flame, and have earned for this species the popular name of "flame tree," a title it shares with the vermilion-flowered Brachychiton acerifolium of the order Sterculiaceæ. In addition to its stately habit and massive flower-clusters the Grevillea possesses attractive foliage. The timber, too, is useful, and furnishes staves of excellent quality, and is used (as is also that of some Banksias) in making picture-frames. It may be remarked here that the wood of all our Proteads is of a very distinctive character. Very closely allied to the Grevilleas are the Hakeas—the main difference being in the position and character of the inflorescence, texture of seed-vessel, and wing of seed. Hakea is (as far as is known) a distinctly Australian genus, embracing about a hundred species. Already gardens are embellished with several varieties. H. laurina, syn. H. eucalyptoides, is one of the best known representatives, and well worthy is it with its showy flowers and distinctive foliage to represent this unique family. More gorgeous still is the superb H. grammatophylla, a variety of H. multilineata, which deserves rank as a distinct species. This rare but meritorious plant I described at length in the *Scientific Australia* for June, 1897, I also had the honour of sending the Royal Horticultural Society photographs and seeds of this stately shrub. The magnificent Waratah (*Telopea speciosissima*) is sometimes regarded as the national Australian flower. It requires a warm sub-tropical climate to bring its superb blossoms to perfection. Its generic name aptly indicates its attractiveness, which [illegible] plant to be readily seen from afar. Many other plants among the [illegible] deserving of careful attention, but cannot now be referred to in a superficial [illegible] like this.

Distributed throughout the entire length and breadth of the continent may be found charming representatives of the large order Compositæ. Moist [illegible] valleys in the southern parts produce abundantly the native musk (*Aster* [illegible] *argophyllus*). It has large handsome leaves lined beneath with a silky [illegible] coloured down, and emits the musk-like odour from which it derives its [illegible] name. Timber cut from its gnarled roots forms a handsome veneer [illegible] birds-eye maple, which it somewhat resembles. Aster argophyllus and [illegible] Bedfordi attain with us the proportions of trees, which is not common in [illegible] order. Included among the Compositæ are very many beautiful everlastings which here, as elsewhere, are of wide distribution. Western Australia is [illegible] in exquisite examples of these deservedly popular flowers. The genus Helichrysum contains some three score species, many of them of more than ordinary beauty. The allied genus Helipterum includes about forty species. Asters—many of them strong-growing shrubs—are rather more numerous than any other genus in the [illegible], which, though one of the most extensive in the world, is fourth with us as regards the number of species. The native daisies (*Brachycome spp.*) have representatives all over the colonies, including New Zealand; but the genus does not seem to extend beyond these limits. Among its two score species are many dainty, attractive, and meritorious plants.

Grasses are represented by a goodly number of species, though exceeded by the Cyperaceæ. Extensive areas in the uninhabited interior produce little else but a so-called "Spinifex" (*Triodia irritans*), which is spiny and utterly useless as fodder. Its sharp spines caused considerable irritation to the legs of the unfortunate beasts of burdens in all the exploring expeditions that crossed any extent of it. It affords shelter to a few native animals and reptiles which form the scanty food of the few nomadic and indolent natives who traverse occasionally these dreary regions. They burn the grass, and thus drive out their intended prey. The "Kangaroo Grass" (*Anthistiria ciliata*), or, as it should be called by priority, Themeda triandra, is a splendid fodder plant. It resists the drought to which the continent is subject, and springs up into growth immediately after rain. "Grass-trees" are common in many parts. The leaves are long and wiry, and the white bases of the young inner leaves are edible and of a nut-like flavour. The flower [illegible] that surmount the tufts of leaves are frequently several feet in height. [illegible] trees (*Xanthorrhœa spp.*) are not grasses, but are allied to the lilies, and were included among the Liliaceæ by our late distinguished Government botanist. Of liliaceous plants we have many varieties. A number are small but none the less beautiful. Grass-lilies of brilliant hues adorn the pastures. The "Fringe-lilies" (*Thysanotus spp.*) speedily arrest the attention of even the most casual observer [illegible] their exquisite beauty. It is difficult to say which is the more admirable, their delicate tints or the fairy-like fringe from which these plants derive their generic and popular names. The "Queensland or Spear-lilies (*Doryanthes spp.*) are strictly amaryllidaceous plants of huge size. They produce an excellent fibre. The Rutaceæ are represented by about two hundred species. The native fuchsias (*Correa spp.*) are handsome flowering shrubs. Eriostemon and Boronia are the largest genera, each possessing many horticultural desiderata. Boronia megastigma from Western Australia produces copiously its sombre-looking but exquisitely [illegible] blossoms. Dried specimens in the herbarium will continue for years to emit this delicious perfume. Several other plants of this genus are of rich beauty. Ficus macrophylla, the "Moreton Bay Fig," may be chosen to represent the genus Ficus, which includes some twoscore native species. It grows into a stately tree, and produces large, handsome, glossy leaves. Another representative of the order Urticaceæ, the "Tree-nettle" (*Laportea gigas*), has already been referred to. The sting of this nettle causes such severe pain as to actually drive cattle mad when they inadvertently brush against the branches.

[illegible]rids of delicate and almost inconceivable beauty cover immense areas. They are locally known as "Native Heaths." They are allied to the true Heaths (*Ericaceæ*), which outwardly they somewhat resemble, but differ in structure and dehiscence of anthers. A by no means uncommon, but never-to-be forgotten, sight is an extensive tract, called a "heathbed," covered with these [illegible] plants in full bloom and exhibiting the richest as well as the most [illegible] tints. The genus Styphelia is the richest in species. Several plants of this order (*Epacrideæ*) possess more than ordinary horticultural merit, but many of them seem averse to artificial culture—a characteristic which they share with many other desirable native plants. Epacris impressa is a striking feature among our indigenous vegetation. Its brilliant and copiously borne blossoms and the vast numbers of individual plants render it exceedingly noticeable and attractive in many an Australian scene. It exhibits great variation in colour, from purest white to brilliant red, with every conceivable tint between. Of palms we have but few examples, but many of them are of imposing appearance. These are chiefly confined to the eastern colonies. Even in the desert interior, however, travellers have occasionally come across stately species which mark out veritable [illegible].

Of orchids we possess hardly three hundred species, many of them exhibiting the grotesque but nevertheless superb beauty which characterises this order. We have about half a hundred genera, many of which, however, are here represented by a single species. Of these exquisitely beautiful plants the genera possessing most species are Dendrobium, Prasophyllum, Caladenia, Pterostylis (often with sensitive labellum and greenish flowers), Thelymitra, Sarcochilus, and Diuris, the pretty little "double-tailed orchids." Many of these are small but of rare and delicate beauty and rich perfume. Of ferns we can boast not only a number of species, but large areas in our enchanting "fern-gullies," profusely covered with the exuberant growth of many handsome and stately as well as delicate varieties. [illegible] of graceful palm-like habit grow in great profusion in humid forest [illegible], and represent the genera Alsophila, Dicksonia, and Cyathea, while the dwarf but massive trunk of our Osmunda (Todea) barbara, endemic to the southern part of the eastern hemisphere, has frequently been known to attain a [illegible] considerably over a ton. The lofty stems of some of our fern-trees are [illegible] with a living mass of verdure, consisting of filmy and other tender ferns, [illegible] the genera Trichomanes and Hymenophyllum, amongst which the [illegible] Hymenophyllum Tunbridgense may frequently be seen. Draping [illegible] spongy trunks of these graceful tree-ferns are exquisite examples of the [illegible] Polypodium, Aspidium, Gleichenia, and others. In my "Census of [illegible] of the Cape Otway Forest" I have recorded from that romantic region [illegible]ree species of these interesting and shade-loving plants, all of which are [illegible] of cultivation. An Australian fern-gully presents a truly magnificent [illegible] the tops of gigantic eucalypts form an interlaced canopy and filter [illegible] the summer sun. Beneath these the undergrowth forms another and [illegible]. This shelters the majestic palm-like tree ferns, whose graceful [illegible] form again a grateful shade for humbler and more tender [illegible]. Every shade of green is here seen. The unfailing stream babbles musi[illegible] below. Spanning its fern-shaded waters here and there are natural bridges [illegible] trunks of prostrate forest giants. These, like the Fern-[illegible], are daintily draped with tender ferns and delicate mosses which here [illegible] in richest profusion. Mint-trees, (*Prostanthera spp.*) laden with their [illegible] blossoms add a new aspect to the scene, which forms an ideal earthly [illegible], and entirely baffles description.

[illegible] (*[illegible] Gregori*) is found in Northern, or more strictly in [illegible] Australia, while the bottle trees of the genus Brachychiton [illegible], are remarkable for their gouty trunks. B. Delabechei, F. v. M. [illegible], L.), the Queensland bottle tree, is of a most quaint appearance. [illegible], the "flame trees," presents a gorgeous appearance when [illegible]. Its brilliant blossoms are borne in great abundance, and the [illegible] of the vermilion hue of the flowers. At the same time the [illegible] by the shedding of the large and glossy leaves. Of food [illegible] hardly any. The few edible fruits are for the most [illegible] insignificant. A few yield also a few edible leaves or roots, but [illegible] poor in plants suitable for human food. Timber-produc[illegible]. Many of the seasoned native woods possess a specific gravity greater than that of water, and are remarkable for durability. Medicinal plants are not particularly well represented, or, at any rate, their medicinal qualities are not known. The eucalypts yield the well-known and widely used antiseptic oil; the Alstonias spp. yield a tonic bitter, useful as a febrifuge; Euphorbia pilulifera is commonly known as the "asthma herb," from its use in that ailment; the Gentianeæ and many others possess valuable tonic properties. While there are others deserving notice, yet many indigenious plants enjoy a quite unearned reputation for medicinal or curative virtues.

Interesting examples of insectivorous plants are included in the genera Nepenthes (three species), Cephalotus follicularis, Drosera spp., and Utricularia, which I have fully dealt with in my lecture, "Insect Traps," *Geelong Naturalist*, vol. v. No. 4. In a superficial and rambling way I have noted a few of what I thought were the most striking points in our flora, chiefly such as possessed interest from a horticultural or utilitarian standpoint. The topic, however, is so great that all we could possibly do would be to glean a few ears of corn from a field white with harvest.

STRAWBERRIES

The Strawberry Crop.

With the exception of the latest kinds, the strawberry season will soon be over, but, so far as this neighbourhood is concerned, it has been one of the best on record. There was an abundant yield last year, but this season's crop has surpassed it both in point of quantity and quality. One thing greatly in favour of the present season is the absence of the great heat and drought that strawberries had to contend with last year, which naturally tended to shorten the supply. With the exception of the past week, when the weather became very hot, the plants have had nothing to distress them previously, and this has enabled the fruit to mature more slowly and ripen up more naturally. It must be admitted that such a successful issue was scarcely anticipated in April last when the plants had to withstand such a succession of cold winds that growth was for the time being almost entirely suspended. Towards the end of the month more genial weather prevailed, followed by a good rain the first week in May, which soon brought the early kinds into full bloom. Then occurred another spell of cold, and the result was that instead of the fruit on the early varieties being ripe as usual the last week in May it was June 17 before gathering in quantity could be begun. Since then all has gone well, and although the season has been late it has been a most successful one. In addition to the yield being so abundant, it should be noticed that the individual fruits have been particularly fine in size, especially those of Royal Sovereign, which were magnificent. Colour has also been all that could be desired, and flavour, if not first-rate at the outset, improved as the season advanced, and has of late been all that one could wish. The finest fruits, it may be remarked, were gathered from last year's runners, and the heaviest crops from two and three year old plants. The runners were layered in small pots and planted as soon as well rooted, early in August, consequently they quickly became established and made fine plants ere winter set in. I find this the best method to pursue to ensure the production of fine fruit for despatching to a distance for dessert, and annually plant several hundreds with that end in view.

Stoke Edith Gardens, Hereford. A. Ward.

Strawberries in Scotland.

The healthy appearance of the plants, and the abundant bloom earlier in the season, gave rise to hopes that the strawberry crop would be a heavy one. These anticipations are now, however, dispelled, for with the main crop ripe and late varieties far enough advanced for the quality and weight of crop to be pretty accurately estimated, it is evident that the crop generally is much below the average. Late varieties appear to be the worst in this respect, and as these probably form the bulk of the crop grown in northern gardens, the deficiency is the more severely felt. My own experience in these gardens may be stated as follows:—Early varieties very good and heavy crops. Successional and main-crop varieties only moderate, while later ones, comprising such well-known sorts as Elton Pine, Filbert Pine, Latest of All, and some others which usually crop so well, carry not more than half a crop, many plants in an otherwise healthy plantation being fruitless. It is difficult to account for this failure, as the bloom was very good and plentiful, and appeared so late in the season, that frosts could not have acted as a factor for evil in their case.

These remarks are intended to apply specially to Wigtownshire, as I have had no opportunity of ascertaining the condition of the crops in the great strawberry growing districts of the Clyde valley, and places further north, but as varieties that have proved specially suitable for the different soils and climate for northern parts are cultivated, though little known elsewhere, the crops may be more satisfactory than they are in this part. During the past fortnight I have visited several of the leading gardens in this county, some of which are noted for fruit culture, and strawberries in particular, but not an instance of a full crop has been pointed out, and in some cases the deficiency is so great that not even a moderate supply was to be expected.

Galloway House, Garlieslown, N.B. James Day.

Pea, Veitch's Masterpiece.—This is a grand cropping pea somewhat similar in appearance to the variety named Main Crop, raised, and sent out by the same firm, and is quite equal to it in quality. It is a dwarf grower, the haulm being about three feet high, and it produces its long slightly curved pods in great profusion. Each pod is filled with from nine to ten large peas, which are of delicious flavour when cooked. It is a fine pea to grow for general crop, and being so productive and of dwarf habit it should commend itself to amateurs and private gardeners, who are hindered from growing the taller kinds through the difficulty experienced in obtaining the necessary stakes for their support.—A. W.

Decorative Plant Groups. Originality of design in the effective or attractive arrangemet of plant groups at flower shows seems to be singularly lacking in gardeners. Just now and then we meet with a "Cypher," or some distant but commendable imitator. Generally these groups are the same in form and character from year to year, and at shows all over the kingdom. They quite fail to attract now; indeed, visitors are satiated with them. I saw a small and most commendable effort made to break away from a stereotyped form at the Henley (Surrey) show recently held. Mr. Bannerman, gardener to a local gentleman, put up, not in competition, a very pleasing and an original arrangement made to resemble a villa fore-court garden. There was a modulated bank at the back, and the sides and front were formed of narrow margins of plants set in moss, an open space in the front being left for entrance. On the little lawn enclosed were three small round beds of plants. The effect was a charming one, and the group was greatly admired.—A. D.

WORK FOR THE WEEK.

COOL ORCHIDS.

THE hot weather that we are now experiencing is very trying to the inmates of the cool houses, and everything possible should be done to keep the temperature a few degrees lower than outside. Our cool houses are lean-to, facing south-west, and thus have the full power of the sun's rays, from eight o'clock in the morning, until eight in the evening; but still it is an easy matter to keep a nice, cool, moist atmosphere within, as they are much below the ground level, and reached by four steps; they are also well supplied with ventilators. About half-past eight in the morning, the house receives a thorough damping with a hose-pipe, then again at three in the afternoon, and if the weather be very hot, another good damping is given at six in the evening; we also dew the plants overhead, morning and evening. The bottom ventilators are kept wide open the day through until evening, when the air is reduced, and the top ventilators opened a little, these remaining open all night when the thermometer usually drops to about 55 degrees. I am much in favour of these low pit-like houses, as it is such an easy matter to keep the atmosphere cool in them, and the moisture does not dry up half so quickly as in more exposed houses. Houses that are in an exposed situation become much drier than those more favourably situated, so during brilliant sunshine heavy shading should be used, and then by damping the shading material two or three times a day, and also occasionally damping the immediate surroundings, a suitably moist atmosphere is obtained.

Cœlogyne Schilleriana, C. ocellata, are two very pretty little cool house orchids, the former having been in flower for the past month; it produces its flowers and foliage simultaneously, while the spikes of C. ocellata appear with the young growths, but the flowers are not produced till the bulbs are made up in the autumn. These two species may be grown together at the warmest end of the cool house, suspended from the roof, and are best grown fixed on pieces of tile or teakwood rafts, with a little sphagnum moss placed between the plant and the rafts. They are now rooting freely, therefore a plentiful supply of water is needed. After the bulbs are made the plants should be watered very sparsely, especially during the winter months. C. cristata and its varieties are now growing and rooting freely, and plants that were not repotted will require unlimited supplies of water at the root, and occasional doses of weak liquid manure. Newly-potted plants will not need such a liberal supply of water, as too frequent an application will sour the soil. Cœlogynes delight in a good syringing overhead on bright days. Dendrobium infundibulum and its variety Jamesianum are not often found in a flourishing condition, being often grown in too high a temperature. The cool house is the proper place for them during the hot summer weather, but about the end of September, when the night are cold, they should be removed to the coolest end of the intermediate house to finish and ripen their growths. They are now growing freely, and require to be kept thoroughly moist at the root; but during the winter they should never be allowed to become dry enough for the pseudo-bulbs to shrivel.—E. SHILL, *New Hall Hey Gardens.*

GREENHOUSE AND CONSERVATORY.

MANY different kinds of spiræas, Solomon's seal, Dielytra spectabilis, and other things that might be mentioned, prove very valuable to the plantsman in producing a display in spring, as these force so freely. The roots can be bought very cheaply in the autumn, and as the growers make a speciality of them they are generally stronger and better adapted for forcing than those prepared in private gardens. It is not in all gardens, however, that the desired number of new roots can be bought in each year; therefore a stock in the reserve garden proves very useful for lifting to follow the bought-in lot. To have these as strong as possible they should be so planted out after having been forced that three sets of plants are available, which will allow two years' growth before they are lifted again. Those intended for potting-up in the autumn would be greatly assisted by soakings of liquid manure, or decayed manure spread between the plants and then well watered in. Spiræas in particular soon feel the effects of dry weather, and instead of making good plump crowns the foliage withers up prematurely and the plants are greatly weakened. We force a large quantity of Solomon's seal, as we find the foliage lasts a long time in a cut state, and proves very useful in spring for mixing with different flowers when fern and other greenery is scarce.

Pot roses that will be required for forcing during the winter should be encouraged in every way. Standing in a sunny position, extra care must be taken that they do not become dry at the roots. Continue to feed the latter so as to support the new growth and keep the foliage strong. There is a danger of mildew attacking the tips of young shoots, but do not wait until these are crippled before measures are taken to check the evil. It is a good plan to syringe them once or twice a week with a solution of softsoap and sulphur, the latter added in sufficient quantities to allow of a little of it remaining on the leaves. The object should be to induce the plants to make a suitable number of strong shoots; therefore, all thin and puny wood should be cut out at once, thus diverting the strength to those required to produce flowers. Roses planted out under glass are somewhat difficult to keep clean during the heat of summer, as red spider, greenfly, and mildew soon put in an appearance where the proper cultural details are wanting. Syringe freely with quassia water, or fumigate, to check the two first pests, and, as before mentioned, sulphur is the best means of stopping the spread of mildew. Where it is intended to pot up a batch of border carnations for early flowering no time must be lost in selecting and layering the desired number of shoots. We find Duchess of Fife very useful for this purpose; the colour of the flowers is pleasing, they are highly scented, and do not split their calyces. By rooting the layers so that they can be potted up at the end of August they become well established in their flowering pots, and there is no trouble in inducing them to flower by Easter by means of an ordinary greenhouse. Gloire de Nancy is another good variety to be treated in this way; the flowers being white, they are much appreciated at the season named. A sowing of mignonette (Machet) might now be made in pots for flowering during the winter. Fill a number of five-inch pots with rich compost and scatter a pinch of seed very thinly in each; cover with fine soil, and water them in. Arrange the pots in a cool, moist frame until the seedlings appear, and, before standing them in a more sunny position, reduce the number of plants in each pot to about five, for when allowed to remain crowded one starves the other, and only spindly spikes of bloom are obtained.—R. PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

THE small amount of rain during the last month has made the soil so parched that growth in many places almost came to a standstill, and watering was one of the chief items of labour. Newly planted vegetables would not make the least move unless well supplied with moisture, and those which had already taken hold of the soil made but little progress. This extra labour in many places threw other work behind to a considerable extent, and this should be made up while there is yet time. Late celery should now be planted, otherwise there will not be sufficient time for it to complete its growth before the days are short. The forward crops should be liberally supplied with water to keep them growing, and where early supplies are needed blanching ought now to be effected. Turnips may now be sown in larger quantities, as they will not be so liable to run to seed, and the roots will remain for a longer time in good condition. Where the ground is fertile it will, however, be better to defer sowing the last lot till towards the middle or end of the month, according to the district, for during mild autumns the roots make rapid progress during the month of October and the early part of November. Red Globe is one of the best for sowing at this time of the year, the roots are sweet and tender, and remain in good condition for a longer period than most others. In the southern counties the last sowing of cabbage seed should now be made. There are so many good varieties that it would be difficult to select the best, Veitch's Main Crop, Sutton's Flower of Spring, and Ellam's Early are all good and will be sure to give general satisfaction. The earlier sowings should be pricked out as soon as they are large enough to handle, and kept growing by liberal supplies of water. As soon as carrots sown in the last month are large enough to handle this should be thinned to a distance of two or three inches in the row. It will not be necessary to give these late sowings so much space as the early ones as the roots will not grow so large. If the soil becomes dry watering must be resorted to or they will receive a check.

The present is usually one of the most difficult months in the whole year in which to obtain good peas, for the hot, dry weather of July usually parches the soil to such an extent that mildew sets in before the pods are formed. To guard against this do not allow the ground to become dry for a distance of at least eighteen inches on each side of the rows. Watering must be repeated almost daily when the weather is very hot. Late sowings should also receive attention in this way, for unless the plants have a sturdy start it is impossible for them to do well. Runner beans should now be plentiful, and the pods ought to be picked as they become large enough for use, for when allowed to form seed the growth of the plants is seriously checked. Watering must have special attention, as the more robust the plants grow the better the results. Dwarf varieties may still be sown in sheltered situations, or where protection can be given in the case of frost. The latest sowings of broccoli and savoys should now be planted, taking care to keep them growing till such time as the soil becomes well moistened by rains. Shallots ought now to be taken up, and after being dried for a few days stored away in a cool place. Endive for a winter supply should now be sown. Plants large enough for transplanting ought to be put out before they become crowded. Make a sowing of Brown Cos and Hicks' Hardy White for winter use. Those who prefer the cabbage varieties may sow Tom Thumb or any of the other small hardy kinds. Tripoli onions should now be sown. We have found none so good for an early supply as the Queen, and these followed by the Rocca, will give a supply from the end of April until the spring-sown ones are ready for use.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

BY this time the bulk of strawberry plants for next year's forcing should be ready for potting. Where they have not yet been cut away from the old plants this should be done at once, and the pots stood for two or three days in a shady place, not under trees, where they will soon recover from the slight check they receive. A slight dewing over with the syringe now and then will assist in preventing flagging, and, as soon as the runners show signs of being self-supporting, potting should be commenced, as they take to the soil much better when not quite pot-bound. Of course, in judging as to their fitness for removal, the lateness of the layering season and the backwardness of the layers should be taken into consideration, as nothing is gained by potting before the roots have filled the soil fairly. The welfare of the plants after potting depends largely on the state of the soil into which they are put, and it ought to be moist enough to keep the plants going without heavy waterings until the roots are moving in the new soil, and, on the other hand, it must not be wet enough to become pasty. Soil which crumbles too freely should have some of the finer particles removed, as the more fibrous the loam the better it will suit the plants. I do not advise the use of much manure with the potting loam; indeed, I rarely add any but a little broken up material from a mushroom bed with a very slight sprinkling of soot. Lime I use rather [illegible] and am not very particular as to the form in which it is used, provided it is not so fresh as to burn the roots. The pots used should be clean, dry, and well crocked.

As to size of pots, this should be governed not only by the habit of the variety, but also the time the fruits are wanted; for instance, if Vicomtesse H. de Thury and La Grosse Sucrée are wanted for very early work, five-inch pots will be big enough, but if wanted from March onwards, I prefer six-inch pots, and for the best layered and biggest plants of Royal Sovereign I propose using a size larger [illegible]. Have sufficient of the roughest soil placed level and well rammed over the crocks to such a height that when the young plant is placed in position the collar comes only slightly below the level of the pot rim; fill in gradually, and well ram each layer of soil, finishing off with a firm surface, and allowing room for plenty of water, as filling the pots too full of soil leads to the plants suffering for want of water, or to the disagreeable necessity of going over the batch a second time [illegible] watering. After potting, set the plants again for a few days in the shade, [illegible] not let them remain long before setting them on a bed of ashes in their [illegible] quarters, as every glimpse of sunshine after they are able to bear it will be of service in ripening up the crowns. See that the plants never suffer for want of water at the root, and syringe them overhead with weak and clear soot water towards the evenings of hot parching days. Should mildew have attacked the [illegible] plants, they should be dipped in a mixture of flowers of sulphur [illegible] between the time of cutting them away from the old plants and [illegible] they are easy to handle while in the small pots, and this renders dipping [illegible]ing easier. If dusting with dry sulphur is preferred, the under sides of the [illegible] should be damped first, and the sulphur powder distributed evenly and [illegible] over them.—J. C. TALLACK, *Livermere Park Gardens.*

Root and Stems.—Why does the root or radicle of an infant plant when it breaks from the seed casing always strike earthwards? was a question asked by a distinguished lecturer the other day, and by him not answered. While there seemed to be nothing marvellous in the undoubted fact that the stem or [illegible] which also and simultaneously breaks from the seed always ascends from the [illegible] because it is understood that light is a potent, attractive force to vegetable [illegible] reason also the root invariably turned from the light was not at all so [illegible]. We have thus raised a very interesting point in plant physiology, one that it would be well if the scientists would clearly elucidate. Have the roots some property [illegible] that renders light to them repulsive? Have they some instinct which [illegible] compels them to turn earthwards to find food in precisely the same way that [illegible] and leaves come into the light to find oxygen and chlorophyll, [illegible] elements to existence, and practically as much plant food in the air as [illegible] potash, and nitrogen are for the roots in the soil. The [illegible] interest.—A. D.

EXHIBITIONS AND MEETINGS.

THE ABBEY PARK FLOWER SHOW, LEICESTER,

August 1 and 2.

The committee of this show this season made their opening day August Bank Holiday instead of the following day, Tuesday, as heretofore, with the result that the exhibition suffered somewhat in consequence. One of the leading features is the cut flowers, and especially roses, and some of the leading exhibitors were absent owing to the difficulty of getting through with flowers on Sunday, and especially on the Sunday immediately preceding a Bank Holiday. Other departments of the show suffered also from the same cause, and it is probable the committee will have to consider the expediency of reverting to their former date. The weather was beautifully fine, the show was opened by the Mayor, and a large number of persons visited it during the afternoon. Rain is badly wanted in Leicester, the park grounds show the effects of long drought, though the bedding-out arrangements, which are of an extensive and elaborate character, are excellent and very gay, while the splendid piece of new subtropical gardening, designed and executed by Mr. J. Burn, is a remarkably fine feature of which the municipality can be justly proud. A large piece of what was hitherto little better than waste land has been converted into a magnificent garden in which can be seen many subjects seldom met with in ordinary gardens.

Specimen plants are generally a somewhat weak feature at Leicester, and in the class for six stove and greenhouse, three are judged for foliage; Mr. Blakeway, The Gardens, Dunsmore, Rugby, was first, and Mr. H. Rogers, nurseryman, Leicester, was second. Some good palms were staged—Allamanda Hendersoni, Bougainvillea Sanderiana, and Statice profusa were the best flowering plants. Mr. Blakeway had the six best exotic ferns—Dicksonia antarctica, Platycerium alcicorne, Davallia canariensis, and three good adiantums. Mr. Rogers was second. There were but two sixes of tuberous-rooted begonias. Mr. James Wright, nurseryman, Leicester, was first with well-grown and bloomed plants of good quality, and Mr. H. Rogers second. Popular as the begonia is, no double varieties were forthcoming. Coleus were in the form of well-grown and coloured bushes, Mr. H. Rogers taking the first prize. Mr. G. Perkins, a local nurseryman, had rather better grown plants, but they lacked colour. Fuchsias were not large, but in the form of well-grown bushes, full of bloom; Mr. H. Rogers first, and Mr. Wright second. Zonal pelargoniums, single and double, made bright patches of colour; Mr. Wright was first with six single, and Mr. H. Rogers second with double forms. The best plant in bloom was Stephanotis floribunda, from Mr. G. Harrison, Belgrave, Leicester. Mr. Rogers was second with Allamanda Hendersoni, and Mr. G. Perkins third with a charming example of Begonia corallina.

Two groups of 150 superficial feet were staged, the ground plan in both cases being the square one, with one central and eight or so side mounds. Mr. H. Rogers, Leicester, was first with an arrangement that was well executed throughout; foliaged and flowering plants, all in excellent character, were grouped in a most effective manner. Mr. Blakeway was second, having a very artistic group, arranged on the same pattern. They were said to be two of the best arranged groups seen at Leicester. There were also a few plant classes, open only to amateurs. Limits of space forbid further particulars.

Some good roses were staged, though, for the reason set forth above, they were not so numerously shown as usual. The best thirty-six came from Messrs. Harkness and Sons, nurserymen, Bedale and Hitchen, which contained a very fine bloom of Her Majesty, selected as the best rose of the show; Madame Eug. Verdier, Comte Raimbaud, Marie Verdier, Madame Hoste, Madame Delville, Helen Keller, Ulrich Brunner, Etienne Levet, A. K. Williams, Harrison Weir, Marquise de Nadaillac, Souvenir d'Elise, François Michelon, &c. An extra prize was awarded to Mr. A. G. Green, Colchester, who staged thirty-six blooms, but which were not according to schedule. Messrs. Harkness and Son also had the best twenty-four, their leading blooms being Mrs. J. Laing, Her Majesty, Etienne Levet, Fisher Holmes, Alfred Colomb, Madame Eugene Verdier, &c.; Mr. A. G. Green, second. Messrs. Harkness and Sons were also first with twelve teas and noisettes, having in good character Maman Cochet, Comtesse de Nadaillac, Souvenir d' Elise, Innocente Pirola, Marie Van Houtte, and Niphetos; Messrs. J. Cocker and Sons, Aberdeen, were second, their best blooms being Cleopatra, Ethel Brownlow, Souvenir d'Elise, Souvenir de S. A. Prince, and Souvenir d'un Ami. Messrs. Harkness and Sons had the best twelve roses of any one variety, having Mrs. J. Laing in fine character; Mr. A. G. Green was second with the same variety. The best twelve blooms of a tea rose also came from Messrs. Harkness and Sons, they having Maman Cochet; the Rev. F. Jackson, Stagsden Vicarage, was second with Catherine Mermet.

In the amateur's division, the Rev. J. H. Pemberton, Havering, Romford, was first with twenty-four varieties, having in fine character Victor Hugo, Horace Vernet, Her Majesty, Comte Raimbaud, Ellen Drew, Marie Baumann, &c.; Mr. W. Boyce, Derby, second. The same exhibitors were respectively first and second with eighteen and twelve varieties. The Rev. F. Jackson had the best six teas; the Rev. J. H. Pemberton had the best six roses of any one variety, having A. K. Williams; Mr. Boyes was second with Her Majesty. Messrs. Whittle, [illegible] and Upton, carried off the leading prizes for roses, confined to amateurs residing in Leicestershire.

Blooms of tuberous-rooted begonias were somewhat poor, and the same can be said of pansies. Carnations and picotees are always a good feature at Leicester. Messrs. Thomson and Co., Birmingham, were first with twelve carnations, flakes or bizarres. The same exhibitors were first and second with twelve yellow grounds, selfs, or fancies; some very good blooms being staged; and also with twelve picotees. Single blooms were also shown in several classes, and bunches were also exhibited.

But one collection of twelve bunches of hardy annuals was staged; a very good lot from Mr. W. F. Gunn, Olton. Chief among them were varieties of annual chrysanthemums, the white and yellow sweet Sultans, sweet peas, Coreopsis Drummondii, &c. But the great feature in the way of cut flowers was the class for hardy herbaceous and bulbous plants to fill a space of fifteen feet by five feet. The three collections staged made a superb bank, large and striking bunches being staged. Messrs. James Cocker and Sons were first; Mr. W. F. Gunn, Olton, second; and Messrs. Harkness and Son, third. The competition was all the more interesting because duplicates were not allowed. Lilies, delphiniums, [illegible] of the Ramosus and Lemoinei types, gaillardias, everlasting peas, [illegible], and others were most effective.

There were many minor classes in which cut flowers were shown by amateurs and cottagers, but the hot weather appeared to have affected the quality of some of them.

Some good fruit was staged, though the aggregate was less than is usual at Leicester. The best eight dishes, three varieties of grapes being admissible, came from Mr. J. H. Goodacre, The Gardens, Elvaston, Derbyshire, who had good Muscat Hamburgh, Muscat of Alexandria, and Black Hamburgh grapes, Queen Pine, Royal George peaches, Pineapple nectarine, very fine Lady Sudely apples, and melon. Second, Mr. McCullock, The Gardens, Newstead Abbey, Notts., who had Black Hamburgh, Madresfield Court, and Muscat of Alexandria grapes, Goshawk peaches, Pitmaston Orange, and Lord Napier nectarines, &c. The next class was for eight distinct kinds, two varieties of grapes being allowed; the first prize, the Veitch Memorial Medal and £5. The award of the judges led to some difference of opinion, as overlooking the fact that the wording of the class drew a distinction between kinds and varieties. They awarded the prizes to Mr. McCullock, who had two dishes of peaches and two of nectarines. Mr. Goodacre, who adhered strictly to the schedule, was placed second. The Abbey Flower Show is affiliated to the Royal Horticultural Society, and therefore under their rules for judging. A protest having been properly entered, the Committee will have to deal with the matter.

Mr. Goodacre staged a fine Queen Pine in the class for a pineapple, the only one shown. Mr. McCullock had the best four varieties of grapes, two bunches of each, staging good Madresfield Court, Muscat Hamburgh, Gros Maroc, and Muscat of Alexandria, all well finished; Mr. Goodacre was second, having Alnwick Seedling and Black Hamburgh in the place of Madresfield Court and Gros Maroc. Mr. Goodacre had the best two bunches of Black Hamburgh, finely finished. Mr. J. H. Elphinstone, Woodthorpe Hall Gardens, was second. Mr. Goodacre also came first with Muscat of Alexandria, and Mr. Knowles, The Gardens, Buckmister Park, was second. The best two bunches of black grapes, other than Hamburgh, were Muscat Hamburgh, from Mr. McCullock. Mr. Goodacre was second with the same. The best two bunches of white, other than Muscat, was Duke of Buccleugh from Mr. McCullock; Mr. Elphinstone was second with Buckland Sweetwater.

The best dish of peaches was Royal George from Mr. Blakeway; Mr. Goodacre second with Grosse Mignonne. Mr. Goodacre came first with nectarines, having Pitmaston Orange; Mr. McCullock taking the second prize with the same. Melons, figs, and cherries were also shown. The best dish of dessert plums was Jefferson's from Mr. Goodacre, and he was the only exhibitor of a dish of dessert apples, having exquisite Lady Sudely. The best dish of strawberries was Waterloo, and there were fine currants, black, red, and white, and very fine tomatos.

Some very good vegetables were shown. The best collection of twelve varieties came from Mr. R. Shaw, of Garrendon, a noted grower; Mr. W. Lord was second. Mr. Shaw had the best six dishes of potatos; excellent, clean samples of Ideal, Reliance, and Mr. Bresee, kidneys; Windsor Castle, Lord Tennyson, and Reading Russet, round; Mr. W. Lord was second. Messrs. Sutton and Sons' special prizes for vegetables brought several competitors. Mr. W. Lord, Esher, was first with a capital collection, and Mr. R. Shaw second. Mr. Warner's first special prize was won by Mr. R. Hoe, Mr. J. Green taking the second. Messrs. Harrison and Sons' special prizes for ten varieties brought a good competition also, Mr. J. Green taking the first, and Mr. R. Hoe the second. Mr. J. Wright and others also offered special prizes. In the cottagers' department capital vegetables were shown.

In the way of miscellaneous exhibits Mr. Goodacre staged a very fine lot of Malmaison carnations and bunches of sweet peas. Mr. Henry Eckford, Wem, also had a unique collection of sweet peas, including several beautiful new varieties. Messrs. W. and J. Birkenhead, Sale, had a table of delightful ferns, which was a great source of attraction. Messrs. W. Cutbush and Sons, Highgate Nurseries, London, staged a large group of plants and cut flowers, most artistically arranged, and which included examples of the new Acalypha Sanderi. Messrs. Harrison had a good arrangement in cut flowers and vegetables; Mr. C. Weston, The Gardens, Quacksick House, Leicester, bunches of charming violas; Mr. J. Wright, cut flowers; Mr. H. Deverill, Banbury, a fine bank of hardy flowers of the best quality; Mrs. Hodgkins, Didsbury, Skelston, leaves and flowers; and the Ichthemic Guano Company, Ipswich, had a highly ornamental stand of their manures, profusely decorated with plants and flowers. Awards were made to all the foregoing.

REDHILL, REIGATE, AND DISTRICT CARNATION AND PICOTEE SOCIETY.

The first show of the above society was held in the grounds of Caberleigh, Redhill, on Friday, July 29, and, judging by the number of competitors and the high quality of the blooms staged, the show could only be pronounced an unqualified success; nor could this be otherwise, represented as it was by such giants of the carnation world as Mr. Martin Smith, of Hayes (whose blooms were, as usual, splendidly staged by Mr. Charles Blick); Mr. James Douglas, of Great Bookham; Mr. Harry Turner, of Slough; and Mr. Robert Sydenham, of Birmingham, together with most of the leading amateur growers in the South. It is much to be regretted that the day was very cold, and although the threatening rain did not descend, it was more like March than July, and the attendance was, therefore, not so good as it might have been.

In the class for twenty-four blooms selfs, fancies, bizarres, or flakes, Mr. Martin R. Smith was a good first with a splendid stand of Purity, Don Carlos, Mrs. Grey Buchanan, Cecilia, Bomba, Helmsman, Jefon, Nora Creina, Alexandra, also a sport from the latter, Blondin, Olga, The Comet, Hidalgo, The Naiad, Goldy-Locks, Orion, St. Albans, Seedling, Gordon Lewis, Rheims, Rob Roy, Autocrat, and Geo. Neville; Mr. James Douglas was second; and Mr. Harry Turner, third; and Mr. Charles Phillips, of Bracknell, fourth. In the class for twelve picotee blooms, white or yellow ground, Mr. Martin Smith was again well to the front with superb blooms of Lily Duchess, Badminton, Duke of Alva, Lady Bristol, Dinorah, Hesperia, Heather Bell, Hygeia, Edith Volage, His Excellency, and Fashion; Mr. James Douglas being second; and Mr. Harry Turner, third.

For twelve carnation blooms, Mr. A. J. Rowberry, of South Woodford, was first with Orestes, Mrs. Sidney H. Diver, Dick Donovan, Cardinal Wolsey, Geo. Cruickshank, Mrs. Eric Hambro, Endymion, Ceres, Mrs. Prinsep, The Czar, Monarch, and Miss Audrey Campbell, Mr. S. A. Went, of Thames Ditton, being second, and Mr. E. Charrington, of Chislehurst, third. For twelve picotees, white or yellow ground, Mr. S. A. Went turned the tables on Mr. Rowberry, beating him with a capital stand of Badminton, Dervish, The Gift, Alice Mills, Voltaire, Golden Eagle, Seedling, Florrie Henwood, Favourite, Jessie, Mrs. Sharpe, and Thomas Williams. In the class for six carnation blooms Mr. Aubrey Spurling, of Blackheath, was first; Mr. St. B. Staden, of Reigate, second; and Mr. E. G. Snudden, of Loughborough, third. For six picotees Mr. M. Charrington, of Hever, was first; Mr. E. Snudden, second; and Mr. St. B. Staden, third. In the classes for three carnations and three picotees respectively, Mr. R. B. M. Morris, of Merstham (the hon. secretary to the society), carried off all the principal honours.

Mr. Robert Sydenham brought (as an experiment) most of the blooms with which he had taken the leading prizes in the single bloom classes at the Crystal

Palace on the preceding Wednesday, his idea being, that through the cold, the blooms had more slowly developed, and would, consequently, last longer when cut. The theory was borne out by the result, for he nearly cleared the board with them in the corresponding classes here. For a vase of carnation blooms, &c., Mr. S. A. Went was to the front with a splendid exhibit; Mr. M. V. Charrington being second; and Mrs. Hadley, third. For three sprays of carnations Mr. A. J. Rowberry was first; Mr. St. B. Staden, second; and Mr. M. V. Charrington, third.

Mr. Aubrey Spurling carried off the Challenge Cup for twelve varieties of carnations, three trusses of each. The special prizes offered by Mr. R. Killick for twelve carnations cut from the open border and staged without dressing, were taken by Mr. M. V. Charrington, Dr. Hadley, and Mr. A. J. Rowberry. For the best table decoration Mr. St. B. Staden was first; Mrs. Hadley, of Reigate, second; and Mrs. W. Morrison, of Reigate, third.

Mr. Cutbush, of Highgate, staged a large collection of sweet peas and carnations; Mr. F. G. Foster, of Havant, a magnificent stand of sweet peas; Mr. H. Cannell, of Swanley, cannas, sweet peas, and carnations; Mr. James Douglas, a fine exhibit of new carnations. Last, but not least by any means, was a lovely group, set up by permission of Lily, Duchess of Marlborough, Dorking, consisting of Malmaison carnations, foliage plants, and ferns.

WINSLOW FLORAL AND HORTICULTURAL SOCIETY, July 21.

THE twenty-fourth annual exhibition was held in the paddock of T. P. Willis, Esq., The Elms, Winslow, and proved a great success, being associated with a programme of athletic sports. The weather was most suitable, and a large attendance resulted. The show was a decided advance on those of the past two seasons, and although entries were seventy more, still there was a falling off in the amateurs' classes for blooms, and the cottagers' for vegetables. A very large group of greenhouse and decorative plants was sent by H. S. Leon, Esq., Bletchley Park, as an extra, and as arranged by Mr. Hislop, his gardener, contributed to swell the attractions of the amateurs' tent.

The schedule provided just over fifty classes, one being "open to all England" for twenty-four varieties of roses. There were three competitors, Mr. John Mattock, Oxford, being an easy first; his best blooms being Maman Cochet, Comtesse de Nadaillac, Marie Baumann, Captain Hayward, Innocente Pirola, Gustave Piganeau, Charles Lefebvre, and Madame de Watteville; the second award falling to smaller flowers from Mr. E. J. Ridge, baker, Thornborough; the third prize going to Mr. W. J. Ridge, farmer, Thornborough. In the ordinary members' class for a dozen blooms, the cards went to J. F. Vaisey, Esq., Nordean, Winslow, and Mr. W. Deacon, gardener to Mrs. Lambton, Redfield, Winslow.

PLANTS in competition were generally nice-sized, fresh specimens; the first prize for six, stove or greenhouse, going to Mr. Deacon, who put up Chamærops humilis, Phœnix reclinata, Latania borbonica, Agapanthus umbellatus, Acalypha macrophylla, and Pandanus Veitchi; the second and third prizes going to G. R. Greaves, Esq., Western House, and T. P. Willis, Esq. For six ferns, Mr. Deacon was again to the front, his fresh, full-sized specimens being Adiantum gracillimum, A. cuneatum, and a seedling, Lastrea felix mas, gymnogramma, and a nice form of polypodium. For half-a-dozen table plants he put up graceful plants of Pandanus Veitchi, Carex marginata variegata, Croton variegatum, Dracænas Lindeni and Cooperi, and Aralia Veitchi gracillimum; Mr. Willis, taking second awards in both classes. Tuberous begonias were very showy, the best six coming from Mr. A. Hedderwick, gardener to R. Mather, Esq., Claydon Camp, who had double forms named Robert Browning, pink; Primrose Dame, yellow; Duchess of Fife, salmon flesh; Alice Crouse, salmon; Rev. E. Lascelles, yellow, shaded orange; and W. B. Millar, apricot. Mr. Deacon had the premier group of coleus; and some pretty petunias came from Western House.

CUT FLOWERS, other than the roses above referred to, included some very nice collections of bunches, the most varied coming from Mr. Deacon, who put up large handfuls of lysimachia, delphiniums, cannas, philadelphus, clematis, roses, liliums, aquilegias, antirrhinums, Alpine poppies, clarkia, sweet peas, carnations, begonias, pelargoniums, gaillardias, and streptocarpus; Mr. E. Ridge, second. Marigolds, stocks, and zinnas were fairly good, but the most artistically-arranged basket, vase or epergne, and bouquet came from Miss L. Bonham, who secured each first card, as well as for the best six buttonholes.

FRUIT made a very interesting feature, high quality ruling throughout. For a collection, Mr. G. F. Ash, gardener to Lord Cottesloe, Swanbourne Park, secured the premier award for a big lot, including dual clusters of Duke of Buccleuch and Black Hamburgh grapes, Countess melon, May Duke, Bigarreau, and Early Red Bigarreau cherries, Black Naples, Red Grape, and White Dutch currants, Red Highlander, Yellow Champagne, Greengage, Whitesmith, and two other dishes of gooseberries, Early Rivers plum, Fastolf raspberries, Elton Pine, and President strawberries, and Irish Peach apple; Mr. Deacon, second, his collection included Buckland Sweetwater and Hamburgh grapes, Prince of Wales peach, Reid's Jubilee melon, President strawberries, gooseberries, and three forms of currants. In the grape classes Mr. Hedderwick was first for black and white with Black Hamburgh and Buckland Sweetwater; the second card, for white, going to Mr. Ash, for Duke of Buccleugh; Mr. Deacon, second in the black class with Hamburgh, and leading in the peach class with Prince of Wales; Mr. Willis, second, with Royal George. Bush fruits were largely represented, the exhibits being fully worthy of the awards, Mr. E. Ridge leading with gooseberries; Mr. W. J. Ridge for red currants; Mr. G. D. E. Wigley, The Walk, with white currants; and Mr. G. R. Greaves for black currants. The best dish of cherries (May Duke) came from Swanbourne Park, and the prizes for strawberries (President) went to Mr. W. S. Neal and Mr. Ash, the premier melon being The Countess, from the last named.

VEGETABLES were, on the whole, very good; the best collection coming from Mr. Hedderwick, who put up Wheeler's Imperial cabbage, Early London cauliflowers, Fillbasket peas, Magnum Bonum French bean, Green Windsor beans, Moore's Cream marrows, Matchless White Kidney potatos, Excelsior onions, Model turnip, and Early Gem carrot.

THE SCOTTISH ARBORICULTURAL SOCIETY.

THE general meeting was held on August 2, 1898, in the society's rooms, 5, St. Andrew's Square, Edinburgh, Colonel Baily, the president, occupying the chair. It was the morning of the start of the society for their three days' excursion to the Forest of Dean in the South, and the proposed State forest or school of forestry for Scotland, so fairly and fully stated in the GARDENERS' MAGAZINE of July 16, also gave great additional interest to this meeting. They, however, must have been specially sanguine who really expected a definite reply or any answer from the Board of Agriculture so soon. To the official application for a grant of £40,000, and an income of £500 a year, for the establishment and support of a school of forestry near Edinburgh, the answer was the stereotyped official one of "received with thanks," and not one word more.

And then the dispatch of business by express began, as a numerous party, some eighty members, had to start at noon to the South. Thus, though the meeting met promptly at ten a.m., it did not leave much time to get through the business. Hence the minutes of the last meeting were taken as read, twenty-one new members were elected, and about the same number to be finally elected at the next meeting. The president's address on Canada, with limelight illustrations, was put off to a more convenient season. The report of the judges and the awards for prize essays was announced as follows: "On the Spring Growth of Forest Trees," by Mr. A. C. Forbes, Bowood, Calne, Wilts, bronze medal; "On the Thinning of High Forest Plantations for Profit," by Mr. Hampton C. Lock, Lyndoch, Perth, bronze medal; "On Planting and Propagating Trees," by Mr. James Gillespie, Lochton Lodge, Inchture, bronze medal. There were other essays and inventions of merit.

After a few remarks on the excursion to the Forest of Dean, to which most present seemed so anxious to start, the excursion—or excursions—for 1899 was brought forward, but remitted to the council with the very sensible suggestion that woods and plantations should be chosen within a day's journey of Edinburgh, and, to give as many members as possible the opportunity of going to one or more of these outings in the woods, these excursions should take place in May, June, and July, 1899. In 1900 the proposition is to visit the Paris Exhibition and some of the forests of France, and that arrangements should be left to the council. Early notice should be given by all members who intend to take part in the 1900 excursion.

Motions by the council and others were speedily withdrawn or disposed of. The most important of these were that every nomination for membership be made in writing, must be signed by the proposer and at least one seconder, and then lie on the table at the next meeting of the council, &c., surely hardly necessary in a society of this sort. Most of our learned societies are glad enough to receive members on easy terms, but at several recent meetings of the Scottish Arboricultural Society some seem bent on keeping them out. One motion withdrawn, in the name of Mr. John Clark, forester, Haddo House, Aberdeen, might prove useful in still further popularising and extending the usefulness of the Arboricultural Society, "that this society establishes at least four branches for the benefit of its members; one at Inverness, one at Aberdeen, one at Perth, and one at Glasgow." No other notices of motions were made, and the business proper concluded with a hearty vote to the chairman, moved by Professor J. Pomerville, of Durham.

The President then, with few minutes left him, gave a brief review of the working plan of the Forest of Dean and the High Meadow Estate, Gloucestershire, whither they were bound. There they would see Mr. Hill's (Conservator of Forests) system of working in getting the woods into a system of rotation, and so keeping up a regular supply of saleable timber. Were State management established, more confidence would be inspired in the minds of all who had to do with estates, and there would be less liability of gluts and scarcities of timber than at present. They wanted to deal with wood as with other commodities grown for profit, and aim at constant supplies of uniform quality. He also pointed out that where forests were planted, other important industries, such as clog and shoe making, firewood, and charcoal burning, &c., sprung up. No doubt this is true. Few intelligent Scotsmen or Englishmen can have visited the Continent often without noticing how much more broadly woods and forests spread out into the national work, life and character than they do at home.

BEDDINGTON, CARSHALTON, AND WALLINGTON, August 1.

THE annual exhibition of this enterprising society was held on August 1 in Beddington Park, and, as usual, afforded abundant entertainment to the thousands of visitors who crowded the place of exhibition throughout the afternoon. As is customary at the annual gatherings of the society, products of the garden were supplemented by a poultry show and bee tent, and in addition an excellent programme of sports was arranged, so that all classes of visitors found plenty to interest them. Upwards of one hundred classes were provided in the schedule of the flower show, and as the competition was, with but few exceptions, keen throughout, the display was remarkable for its extent and high quality.

One of the most interesting of the large number of classes provided is that for a collection of vegetables comprising nine kinds to be arranged on a four-feet space of the show table. In this class the orthodox method of procedure of offering first, second, and third prizes is departed from, and instead six prizes, amounting to £5 in the aggregate, divided proportionately with the points of merit, are awarded to the collections. Under these conditions the exhibitors receive an amount of money more in accordance with the quality of their collections than under the usual conditions; but this fact does not appear to apply an additional stimulus to competition, and the judging necessarily occupies much time. There were six or seven entries, and the premier award was made to Mr. J. H. Stevens, gardener to A. C. Coles, Esq., The Lodge, Wallington, who obtained an aggregate of fifty-six points. His collection comprised excellent Snowdrop potatos, Dobbie's Model turnips, Wheeler's Imperial cabbage, Long White marrows, Pragnell's Exhibition beet, good peas, cucumbers, and onions. Mr. H. Shoebridge, gardener to Mrs. Beddington, The Limes, Carshalton, was second, his collection receiving forty-eight points, and containing exceptionally good Canadian Wonder French beans and Moore's Vegetable Cream marrows. Mr. Harry Hopkins, Carshalton, who invariably obtains much distinction in the cottagers' division, was third, receiving forty-seven points. Mr. Sell, gardener to J. Wallis, Esq., Wallington, was fourth, with forty-six points, and Mr. J. Cripps and Mr. McRae, who were fifth and sixth, were adjudged forty-three and thirty-seven points for their respective collections. With an aggregate of two hundred and seventy-seven points the value of each point is about fourpence half-penny, and while the difference in the value of the first and second is less than three shillings, there is a difference of fourpence half-penny only in the value of the second and third, and the third and fourth prizes. There were two other classes for collections, in which the classes were awarded in accordance with orthodox practice, and in these also the produce was highly meritorious. In one of these Mr. Hopkins was first, and in the other premier honours were obtained by Mr. W. Ames.

The contributions to the whole of the plant classes were more or less numerous, and in competition for prizes offered for groups of plants open to gardeners with limited assistance, Mr. Etheridge, Wallington, was a capital first, with a tasteful arrangement, in which caladiums, gloxinias, panicums, lilies, and bamboos were employed. Mr. Gates, Sutton, was a capital second. For a large group, open to all members, Mr. Stevens was first, with an arrangement remarkable for its light appearance and effectiveness. A class was on this occasion provided for tables of plants, and Mr. Lewry occupied the post of honour with a table so beautiful as to attract much attention. In the other plant classes the most successful competitors were Mr. Etheridge, Mr. Shoebridge, Mr. Lewry, and Mr. Gates. Mr. J. [illegible] Box, Croydon, contributed a fine collection of roses and sweet peas. The principal exhibitors in the fruit classes were Messrs. Stevens, Osman, and Shoebridge. The arrangements were admirably carried out by Mr. Toogood.

CARNATIONS.

At Edenside.

Tuesday, August 2, was a glorious day—a delightful one for a trip out into the breezy mid-Surrey district where Mr. James Douglas has established his now world-famed Edenside Nursery; and so, taking an early train by the L. and S. W. Railway to the station of Bookham and Effingham, we were right out in the midst of a healthful country within one hour from London. It is some years ago now, about seven, that Mr. Douglas commenced operations close to the Bookham station, and established the Edenside Nursery. More recently he and his family have taken up residence there, much glass has been built, and the cultivation of land considerably extended to keep pace with the steadily increasing demand for carnations, picotees, auriculas, polyanthuses, and cinerarias. Whatever Mr. Douglas has taken in hand he has done well, and whether it be the raising and cultivation of carnations as a business, flower gardening for pleasure around his pretty house, raising seedling orchids as a hobby, or collecting horticultural books as a pastime, one cannot but admire the earnestness of purpose that, combined with skill and keen business ability, has always characterised the actions of this, the foremost florist of our times.

Our visit was made expressly for the purpose of seeing the carnations and picotees, which occupy a very large amount of space and are now in large light and airy greenhouses where seeding and layering go on apace. Somewhere about three hundred varieties are cultivated, but Mr. Douglas endeavours to keep down the multiplication of slight varieties as far as possible, and as soon as one variety is fairly outclassed it is discarded and so ever the fittest survive. Besides these named varieties already in commerce, or just about to be put on the market, there are a quantity of new seedlings, among which are not a few that Mr. Douglas expects great things from; another year or two will, of course, decide whether they are catalogued or consigned to oblivion Walking through the houses at Edenside one is struck with the vigour of the plants; the strength of the flower stems, and the wonderful number of first-rate blooms that even the unthinned trusses will carry. The beauty of the flowers next claims our admiration, and it is most difficult to decide whether one admires selfs or fancies most; the conclusion is that both are lovely, both have their uses, and, fortunately, there are in both classes an abundance of varieties that are suitable alike for the garden border or for special cultivation for exhibition; the blooms are shapely and bright, while for quantity no flower can surpass them in their season. At Edenside one has fine opportunities of comparing varieties and of gauging their freedom.

Taking the selfs first, the difficulty is of reducing the number of varieties so as to make the list valuable to those who have not the space to cultivate carnations extensively. Those noted are mostly new or almost new varieties. For a beautiful rich rose pink, which has a suspicion of scarlet, it would be difficult to surpass Ashphodel, and why the catalogue description should say, "best flowers are produced on two-year-old plants," we cannot tell, for the year-old plants are producing splendid blooms in quantity. Mrs. Gascoigne is another splendid rose-pink, but quite distinct from Ashphodel. Do you want pure and broad-petalled white varieties, then try The Briton, very free, and a non-burster; Helmsman is a grand large-flowered white variety; while Nautch Girl is a lovely Douglas' seedling, that is palest silvery blush when first expanded, but becomes pure white quickly. Turning from whites to dark hues, the merits of Sir Henry Irving as a grand crimson carnation are forcibly brought to mind, for the colour is most handsome, as the crimson is lit up with an undertone of scarlet; Lady Hindlip is a fine companion to the former, being a beautiful crimson-scarlet self of great beauty. The darkest form seen was Nox, a velvety, blackish crimson flower, of good shape, and most effective. King Arthur still holds its own as a scarlet flower, producing large blooms with very broad petals. Few varieties have prettier blooms than the new Holwood, that is intense marone-crimson in colour, and very free; the Cali, too, is magnificent, producing vivid scarlet flowers with the utmost profusion, and of such good form that it is valuable alike for the garden and the exhibition board. The rosy scarlet Boadicea is beautiful both in form and colour, and has such stout, wiry stems that it is one of the finest of border carnations. There are many lovely pink carnations, and among the very best are Endymion, a grand salmon-pink, with soft, broad petals; May Yohe, rich red-pink, exceptionally vigorous, and with pleasingly fragrant blooms; Queen of Scots, a delightful shade of rose-pink, a good grower, and of fine shape.

Yellow carnations are now as plentiful as any carnation lover could wish, but their abundance is not an unmixed blessing, especially for the small amateur. It seems to us that ere long the National Carnation Society will have to institute trials of yellows, if not of other selfs, and then give their supporters a list of selected varieties. Fortunately Mr. Douglas does a vast amount of "weeding" at Edenside, and so the difficulty of selection is reduced. The brightest of new yellows is, no doubt, Pandelli Ralli, a grand border carnation, good in habit, and a persistent non-burster; Queen of Sheba has deep buff-yellow flowers of large size and good shape; Sir Isaac is also a very fine yellow self, rich and free; Dr. Johnson is a handsome deep buff form; Diana gives us a lemon-yellow; while Andromeda is a deep yellow, carrying an abundance of splendid flowers on erect [illegible] stalks. Of late another and distinct shade of colour has been produced in carnations, and is a sort of mixture of yellow and brown. One of the brightest forms is seen in Hampden, a large and finely-formed carnation of a deep buff hue; Mrs. Colby Sharpin is a variety that shows the new shade well, it is bright yellowish-cinnamon, fine for border or show board; Calipha is another of the section, a tawny, with soft reddish-cinnamon flowers—a first-rate border carnation. Mrs. [illegible] Buchanan gives us a pretty apricot tinge. Two good rosy-carmine varieties are Francis Wellesley and Mrs. J. Douglas, the former having rather the richer colouring. A pair of very distinct selfs comprise Haidee, a curious and deep [illegible]-lavender shade, with mauve shading, and Bendigo, by far the finest blue-purple yet raised.

Yellow ground fancies and picotees are most fashionable just now and certainly they are most effective. They form a numerous class, and being very free of flowering, brightly marked, and good growers they have quickly become popular. Some few are "bursters," but these will be left severely alone by all but exhibitors. His Excellency is a fine new yellow ground picotee with a narrow margin of soft scarlet; Mrs. Tremayne is light yellow, heavily edged and marked with the most brilliant scarlet; Mohican, with rich yellow ground, edged and [illegible] scarlet, is very handsome; Hygeia, yellow, edged with rose; Harlequin, [illegible], marked with rose and crimson; Mr. Nigel, clear yellow, heavily edged [illegible] scarlet; Miss Violet, rich yellow, heavily edged and marked with rich [illegible] is a splendid new picotee; and Dervish, yellow, edged rosy-lilac; these [illegible] good among the new picotees. The fancies are numerous, but a short selection will include Miss Mackenzie, soft yellow, marked with rose, a non-burster; Czarina, yellow, most brilliantly marked with intense scarlet; Zingara, in the way of Hidalgo, deep yellow, heavily marked with scarlet and crimson Perseus, rich yellow, marked with orange and scarlet; and Brodick, deep yellow, marked with rosy-scarlet. Other fancy carnations are Pelegia, especially handsome, pink, flaked with pale lavender; Delightful, well named, white, with a few light splashes of soft scarlet, a splendid flower in size and substance; Artemis, scarlet ground, marked with dark silvery rose or lavender; and Miss Florence, white, ligthly marked with reddish rose.

Malmaison carnations, all in the rudest health, are to be seen in large quantities at Edenside, but few are now flowering. Mr. Douglas has a splendid stock of Lady Grimston, Churchwarden, Nell Gwynne, and other of the splendid Martin-Smith productions. He has also some splendid additions to the true white ground picotees, Fortrose and Charlotte Brontë being an especially fine pair, the former a light rose edge, the latter a heavy red edge variety, and both having beautiful broad petals. The Edenside collections teem with interest, and, in spite of hot weather, there will be lots of flowers to be seen for some time to come on the many thousands of healthy, vigorous plants that fill the several spacious houses.

At Chelsea.

It has been frequently remarked that the carnation is a townsman's flower, and when we remember what the Birmingham amateurs can show in the way of fine carnation blooms, and also know what Mr. Martin Rowan does, then we are compelled to believe that statement. If further confirmation is necessary, then a visit to the Chelsea nurseries of Messrs. J. Veitch and Sons during carnation time will dispel all doubts as to the value of both carnations and picotees for town gardens. At the Brompton end of the Chelsea nurseries there are thirty beds, each about twenty-two feet by three feet, planted with a large number of the best varieties; selfs are most largely represented, and in some instances a whole bed is devoted to a variety, this being so in the case of such free flowering and dwarf-growing sorts as the white Mrs. Frank Watts and the scarlet Joe Willet. Altogether, the Veitchian display comprises nearly three thousand plants out of doors, besides a very large number in pots, in cold greenhouses, where they can be examined, should a visitor arrive on a wet day. Besides the selfs, there are a large number of fancies and yellow ground picotees, a class (for it is difficult to draw the line between them), that is becoming increasingly popular year by year. Judging from the number of plants grown, it would seem that flakes, bizarres, and pure picotees are not nearly so much in demand as formerly, but, on the other hand, there is a growing interest in those selfs and fancies that are grouped under the head of border carnations.

One of the most distinct selfs of recent introduction is Bendigo, a free flowering bluish-purple variety that is most effective in a mass; Knight Errant is a fine dark scarlet self, while Sweet Briar is equally good, but of a paler colour. Other scarlet varieties of great merit are Boadicea, which has a rosy suffusion, and is a handsome flower; Hayes Scarlet, wonderfully free and bright; Ness, a strong grower with exceedingly brilliant blooms; Cantab, one of the older varieties, but still good; Edward Marshall, a finely-formed scarlet flower; Mrs. Macrae, a decided improvement on Hayes Scarlet; King Arthur, a magnificent crimson scarlet with big, broad, and smooth petals; Little John and W. J. Fish, the latter a very bright scarlet. Passing to crimson selfs, Sir John Falstaff is noticeable both by reason of its rich colour and large flowers; John Hare is also a fine crimson self, while for freedom and fragrance the Old Clove is still worthy of cultivation, and does well at Chelsea. Mephisto and Uncle Tom are deep hued varieties, the latter also having a slight shading of deepest scarlet. Lady Hindlip, about half-way between scarlet and crimson, is a splendid variety that is bound to become very popular. Of yellow carnations there are innumerable hosts, and all save the specialist are bewildered with so many names where all the varieties seem so nearly alike. There are, however, differences of growth, habit, shade of colour, and shape of flower. There are now numerous beautiful yellow selfs as free as the tall Miss Audry Campbell and Duke of Orleans, but dwarfer in habit; Mrs. Harry Escombe is a fine hardy yellow in the way of Germania; Mopsa does well outside at Chelsea, and is apricot-yellow with broad petals; Pandelli Ralli is a lovely bright yellow flower with perfect calyx and good alike outdoors and under cover; Mrs. Patrick Campbell has flowers of a pretty primrose hue, while for those who desire a deeper colour there is Nabob, orange-buff and very large. Britannia is good, so also are Corunna and Pride of Penshurst, the former being rather better than the latter. Among buffs, Mrs. Reynolds Hole still takes a prominent place; then there is Cinnamon, a curious shade of colour, but now likely to be superseded by the handsome and new Mrs. Colby Sharpin that has flowers with quite a brownish tint.

White self carnations are plentiful, and among the very best we have to place Mrs. Eric Hambro, a variety that needs no praise; Sir Wilfred Laurier is very free, and has smooth petals such as will recommend it to exhibitors. For freedom and fine petals few can exceed Edith Ladenham, while the flowers are very pure white; Princess Charles of Denmark is also a fine white, and other white selfs of great merit are Miss Ellen Terry, Snowdon, and Waterwitch. For general usefulness and beauty few carnations surpass the blush-tinted Seagull, while it can hold its own for vigorous and floriferous habit. Mrs. J. Douglas provides us with a beautiful rose carmine self, to which the delicate flesh-tinted Cassandra is a good companion; Exile, deep rose; Her Grace, pale blush; May Morris, rose; Rose Celestial, bright rose; Braw Lass, Eudoxia, Ketton Rose, Sadek, and Duchess of York are all lovely and good carnations of various shades of rose and pink. Lady Nina Balfour must not be omitted from the list, for it is a free-flowering soft blush self of great merit. Yellow ground picotees and fancies deserve notice by reason of their gay colouring, bold habit, and large blooms; Figaro, Cardinal Wolseley, Mr. Nigel, the Czar, Don Juan, Voltaire, the Gift, the Dey, Eldorado, Dervish, Wanderer, very fine; Miss Alice Mills and Hygeia are all first-rate, and make a glorious display, with or without protection. One other fancy, and that a white ground, deserving of mention, is C. W. Townley, a bold form heavily splashed with deepest crimson. These, of course, are but a few of the carnations we saw at Chelsea, but they are among the very best, and selected for their abundance of flowers as grown out of doors.

Sweet Peas.—Thanks are due to our careful sweet pea raisers in not only giving us such a choice of colours, but also for increase of fragrance. A very skilful grower was the other day compelled to admit there was a gain of fragrance, and I am persuaded some of the newer varieties are far more fragrant than others. Sweet pea culture is simple in the extreme, any ordinary soil will grow them, and if three feet high, they will give an abundant and continuous bloom, especially if the seed pods are kept down. I give my selection of six varieties, out of two dozen, though all are good: Blanche Burpee, white; Monarch, bronze crimson; Duke of York, rosy-pink; Stanley, marone; Mars, crimson; and Celestial, light blue.—Stephen Castle, F.R.H.S., *Bottesford Vineries, Notts.*

NEW BOOKS.

The English Flower Garden. By W. ROBINSON, F.L.S. (John Murray, 50A, Albemarle Street, London.) 15s.—The issue of the sixth edition of this important work is a matter of considerable interest to horticulturists, inasmuch as it indicates a continued increase in the popularity of hardy flowers, and proves to demonstration that the book which has done so much to influence public taste in its relation to the flower garden is held in high estimation by those who are more or less interested in the ornamental aspects of gardening. So well devised was the work in the first instance that it has not undergone any material alteration in plan since the publication of the first edition in 1883, and the change that has been made in the several editions has consisted chiefly of an amplification of details, and a consequent increase in the number of plants described, and in the illustrations; and a fuller treatment of the principles of design and arrangement. The present edition has been increased by six new chapters in the first of the two parts of the book, and as these deal with details with which those engaged in flower garden management should be familiar, they add materially to its value.

Both in the preface and the body of the work we have ample evidence that the author has lost none of his love for hardy plants or his distaste for the excessive use of plants which, if not sufficiently hardy to bear the rigours of our winter, can be successfully cultivated in the open during the summer months. In his "Forewords" to the new edition, the author gives a brief sketch of his endeavour during the past thirty years or so to create an interest in, and promote the cultivation of, hardy plants, and to those who did not become so wedded to the "bedding system" as to be unable to appreciate the beauty of plants not suitable for massing, this sketch can hardly fail to be interesting reading. We fully agree that when the author commenced his crusade "The flower garden planting was made up of a few kinds of flowers which people were proud to put out in thousands and tens of thousands, and with these patterns more or less elaborate were carried out in every garden, save the poorest cottage garden." But is must not be forgotten, in discussing this question, that the bedding system, with its many objectionable features, was the result of a re-action from the dull and weedy appearance presented by borders of hardy flowers during a considerable period of the summer. Much of the unattractiveness of the borders was undoubtedly due to a want of appreciation of the charms of some of the plants then available, and to an imperfect acquaintance with the cultural requirements of some of the best kinds. This much we readily admit; but, in doing so, we must direct attention to the fact that a considerable number of our most beautiful hardy plants have been introduced within a comparatively recent period, and that of the hardy plants in cultivation previous to the origination of the practice of massing tender plants a considerable proportion were not readily obtainable. With a distinct recollection of the miserable appearance presented in summer by not a few herbaceous borders that existed long after the bedding system had become popular, we can fully sympathize with those who desired more colour in their gardens; but, like the author, we have no sympathy with the practice of those who gave up the whole of their gardens to summer bedders and produced brilliant displays of colour, in which yellow, blue, and scarlet predominated. Happily, a better state of things now obtains, and those who are desirous of producing a series of effects in the garden over the longest possible period are careful to employ hardy and tender plants in combination, and we trust this practice may long continue, particularly in small gardens, in which it is difficult to maintain a continuous succession of flowers throughout the summer from hardy plants alone.

We are pleased to see that the author condemns the practice, much too general, of slavish imitation in garden design, and we agree with him that "the aim should be to make the garden a reflex of the great garden of the world itself, and to prove that the true way to happiest design is not to have any stereotyped style for all flower gardens, but that the best kind of garden should arise out of its site and conditions as happily as a primrose out of a cool bank." We require more originality in garden design, and were those entrusted with the formation of gardens to more carefully consult the genius of the place and adapt their plans to the situation and the configuration of the ground and its surroundings instead of adapting the area to preconceived plans we should have a closer approach to true art in our gardens and a greater diversity both in their design and their occupants than is possible under the conditions governing the methods of procedure in so many instances. In the chapter on "Art in Relation to Flower Gardening," the author discusses this question at some length, and although we may not be prepared to attach the same value to cottage gardens as illustrating the importance of simplicity in garden design as is given them by the author, we are in full agreement with the views he so forcibly expresses with regard to the necessity of improvement and the means by which it might be effected. This chapter and the two immediately following contain so much that is of importance on the question of taste that they should have the most careful consideration of those who are desirous of obtaining a clear conception of art in relation to the garden. The value of the work is by no means limited to the information contained in the three chapters to which reference is made; but we have directed special attention to them because of the desirability of a more intimate acquaintance with the first principles by all who are in any way concerned in the formation and management of the flower garden. There are twenty-eight other chapters—all more or less satisfactory—in the first part of the book, and the second part is devoted to an enumeration of the most beautiful hardy and half hardy plants, and hardy trees and shrubs suitable for British gardens, with ample cultural information. The book is fully illustrated with excellent woodcuts, the illustrations comprising examples of beautiful gardens and portraits of the majority of the plants mentioned in the second part.

Home Gardening. By W. D. DRURY, F.R.H.S. (L. Upcott Gill, 170, Strand, W.C.) Price 1s.—The author states that in the preparation of this manual his object has been to assist amateurs who are turning their attention to the delightful pursuit of gardening, and in his endeavour to accomplish this laudable object he has achieved so high a degree of success as to deserve the heartiest congratulations. The manual comprises 130 pages and is divided into seven chapters. Excellent advice is given on the formation and management of flower, fruit, and kitchen gardens, the stocking and management of the greenhouse and pit, window gardening, room decoration, the embellishment of walls and trellises and other cogent subjects.

Flower Favourites. By LIZZIE DEAS. (George Allen, 156, Charing Cross Road, London.) Price 3s. 6d.—A dainty book in which the authoress discusses with singular freshness and ability the legends and symbolism of about fifty of the more popular flowers grown in British gardens. A work of greater interest to those who desire to know something of the plants on which they lavish their care, beyond their cultural requirements it is difficult to conceive, and the authoress and publisher have rendered valuable service in thus placing within the reach of all plant lovers in so readily accessible and pleasant a form such an immense amount of information relating to the legendary associations of the majority of our popular garden flowers.

ANSWERS TO
CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS MAGAZINE, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates

Caterpillars.—E. C. K., Douglas: We were not able to recognise the species of caterpillar sent us, but one poor specimen remained, and it had evidently turned cannibal and eaten large portions of the others imprisoned. If you can eventually send us a moth we will endeavour to indentify it.

Twin Dahlia.—C. S., New Barnet: The specimen sent is an example of fusion, almost of fasciation. It is not very often that such fusion is seen in the flower stems, but it frequently occurs in the growths. The specimen is a freak, for which no proper cause can be assigned; probably the compression in the bud stage overcame the tendency of the peduncles to separate, and so the two stalks became permanently united.

Spikes of Stocks.—N., Kettering: The stock has an inflorescence that may be called a branched spike, and provided the plant has not branched previous to the time when it shows flowers or buds, then the whole of the inflorescence would form one spike for the purposes of exhibition. The ambiguity of some schedules is remarkable, and yet, with a little care, the committee could make class definitions that it would be impossible to misunderstand. The strict botanical definition of a spike is "an inflorescence in which the flowers are sessile along a simple undivided axis or rachis"; there are, however, varieties of spikes.

Dahlias Failing.—E. E. P., Ware: A grub of some kind (too shrivelled for identification) has attacked the dahlia stems from below and done all the damage. Pull up the plants and burn them; also remove the soil that immediately surrounded the plants attacked, and either burn or gas-lime it. Tie out the other plants so as to fill up the gaps, and supply them with fairly strong liquid manure. Keep a sharp look out for further attacks and set traps, such as the hollowed halves of freshly-cut potatos, under the surface of the soil, examining these every day or so and killing any grubs caught. It may be necessary to gas-lime the plot after the dahlias have been lifted, but this may be judged by the prevalence or absence of the pest during the rest of the season.

Gooseberry and Currant Cuttings.—J. C. T., Billinghurst: There is no great advantage to be gained from taking gooseberry and currant cuttings at this early date; in fact, with a continuation of dry weather, there will be some disadvantage by reason of the difficulty in keeping the soil moist. The general practice is to take cuttings in October, as soon as the leaves have fallen, using straight and well-formed shoots of the current year. These should be inserted at once in fairly rich soil in a shady position, placing about six inches of the [illegible] in the ground. All the buds or eyes in the inserted portion should be rem[illegible], so as to prevent the formation of suckers at a later date. Also remove the upper part of the cutting, leaving six or eight inches out of the ground. Set the cuttings six inches apart in rows a foot apart. If you have the time and convenience, there is, however, no good reason why cuttings should not be inserted this month, for such will root freely if shaded and kept moist.

Judging Vegetables.—Anxious, Long Eaton, writes to ask "if, in judging a collection of vegetables, six or eight distinct varieties, it was found that an exhibit contained two sorts of potatos, one white and one coloured, would the[illegible] two be counted as one vegetable or judged as two varieties? Such an instance [illegible] occurred, and opinions as to what is right and wrong differ considerably." [illegible] presume that the whole question hangs upon the wording of the schedule, [illegible] wish our correspondent had sent us the class definition. If the regulation [illegible] "Collection of six or eight distinct varieties," then if anyone showed [illegible] ber of distinct varieties of potatos, or of cabbages, or of onions, or indeed [illegible] other vegetable would be admissible, and could not legally be disqualified. The two varieties of potatoes should be counted as two in a collection of six or eight and not as one. The schedule would be more precise and understandable if "kinds" instead of "varieties" were used in the wording, for no doubt the committee intended such a meaning to be implied. Kinds of vegetables are potatos, cabbages, cauliflowers, peas, turnips, etc., while varieties would be the variously named seedlings or sports of these; thus the Windsor Castle, Ashleaf, or Syon House Prolific are varieties of potatos, and potatos are [illegible] vegetable.

Names of Plants.—Under this heading we can only undertake to [illegible] species and specific varieties of plants, and not florists' flowers. Specimens [illegible] be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

A. C. L.: 1, Polygonum cuspidatum; 3, Pentstemon Cobæa; [illegible] f.f. cristata grandiceps; 5, Hypericum Moserianum; 6, S[illegible] Nepeta glechoma variegata; 8, a Leptosiphon.

H. E., Nottingham: 1, Begonia maculata; 2, Maranta [illegible] floribunda; 4, not recognised; 5, Sedum aizoideum variegatum; [illegible] in flower.

J. F., Yorks: 1, Selaginella Kraussiana; 2, S. Gale[illegible] specimen, but probably Leycesteria formosa; 5, Santolina [illegible] incana.

Names of Fruits.—W. A., Bexhill: Devonshire Quarrenden.

BOTANICAL GARDENS.

ONCE a year, if not more frequently, attention is drawn to the Royal Botanical Gardens in the Regent's Park by the public discussions of the council. The financial position of this old-world property is notoriously anything but satisfactory. The ground was originally a market garden kept by a man named Johnson, which flourished in the days of the Regency. When the Prince Regent became George IV., and Nash, the architect, was commissioned to build Regent Street and design the Regent's Park, the "first gentleman in Europe" thought he should like to have a semi-rural palace at the end of a vista, which was to begin where the asparagus and cabbages were growing, and end where Carlton House then stood, and Carlton House terrace now stands. This, however, was not to be, and when the park was laid out, the well-wooded ground in question—about twenty acres, more or less—was handed over to the Royal Botanical Society, at something like a peppercorn rent, which obtained a charter, elected fellows, and proceeded to cultivate plants and flowers. Other portions of the new park were given by the Controlling Department, the "Woods and Forests," to the Zoological Society, the Toxophilite Society, the East End Charity of St. Katharine, whose almshouses and buildings were wanted for the St. Katharine Docks, and a few private favourites of the Court. The St. Katharine's transmigration was the most wonderful of all—quite as wonderful as the creation of St. Thomas's Hospital, opposite the Houses of Parliament, by the determination of the South-Eastern Railway to reach Cannon Street and Charing Cross. The Reverend Principal of the charity found himself transplanted from Ratcliffe Highway to a *rus in urbe* lodge and enclosure worth more than £1,000 a year, and the East End cottagers soon found a very profitable summer market for their new almshouses by letting lodgings.

The management of the Botanical Gardens was then in harmony with the age—the age of Colosseums, cycloramas, Miss Linwood, the "Invisible Girl," the "Earthquake at Lisbon," and panoramas of London and Paris. That management, the malcontents aver, has never been practically changed, and the policy of 1838 is being continued in 1898. The reformers have been ably and energetically led for some time by Mr. J. S. Rubenstein, the eminent solicitor, and at the annual meeting, to be held in the Gardens on August 10, at one p.m., he intends to recommend that the system of electing the members of the council, whereby they are practically elected and re-elected year after year by the council itself, should be brought to an end, and further that the scientific and administrative branches of the society's work should be divided, and that each branch should be supervised by a competent manager. He will also propose the establishment of classes for the study of botany, to be open to all students; the reorganization of the refreshment department and the acquirement of a licence for the restaurant, newly built in the Gardens. Mr. Rubenstein will also suggest the erection of a large floral hall, to serve as a winter-garden, where exhibitions, flower shows, receptions, and musical promenades can be held in all seasons. There is nothing very revolutionary in these propositions—nothing beyond an "up-to-date" policy, which should have the effect of relieving the society from its financial troubles. An extension of the lease (almost expired) for another term of twenty-one years has been granted by the "Woods and Forests," still at what is undoubtedly a nominal rent for such extensive and secluded sylvan grounds within a mile of Piccadilly Circus. If the old Physic Garden at Chelsea are really to be removed, here is a place quite as accessible for all the rare and valuable plants, and a management quite as liberal as the management of the Zoological Society will add another civilized outdoor attraction to the few existing in London.

JOHN HOLLINGSHEAD.

NEW INVENTION.

A New Hop Washing Plant.—The old and expensive system of washing hops by means of hand pumps is likely soon to become a thing of the past. Mr. R. W. Thomas, of Rodmersham, Sittingbourne, has just invested in a steam plant, made by Messrs. Merryweather, of London, under Merryweather and Curlings' patent, which in efficiency and economy of working is superior to the older inventions. It consists of a light portable steam pump, supplying from twelve to twenty-four spray jets through portable iron pipes with flexible joints and rubber hoses. The whole of the pipes can be laid down ready for use in half an hour, and the pipes shifted by a few men to various parts of the garden as required. The first cost is about one-tenth of a fixed plant, and the cost of working is about half that of hand apparatus, while the steam plant is also applicable for spraying fruit, corn, and vegetable crops.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, AUGUST 9.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m., on "Water Lilies," by Mons. Latour Marliac.
WEDNESDAY, AUGUST 10.—Bishop's Stortford Summer Show.
Hastings and St Leonard's Horticultural Society.
Chippenham and Calne Horticultural Society.
Sevenoaks Summer Show.
Ladywell and Lewisham Cottagers' Show; Two days.
Ashbourne Horticultural Society.
King's Somberne Horticultural Society.
THURSDAY, AUGUST 11.—Taunton Deane Horticultural Society.
Alderley Edge and Wilmslow Flower Show; Two days.
SATURDAY, AUGUST 13.—Royal Botanic Society, General Meeting.
Heaton Mersey Floral Society.

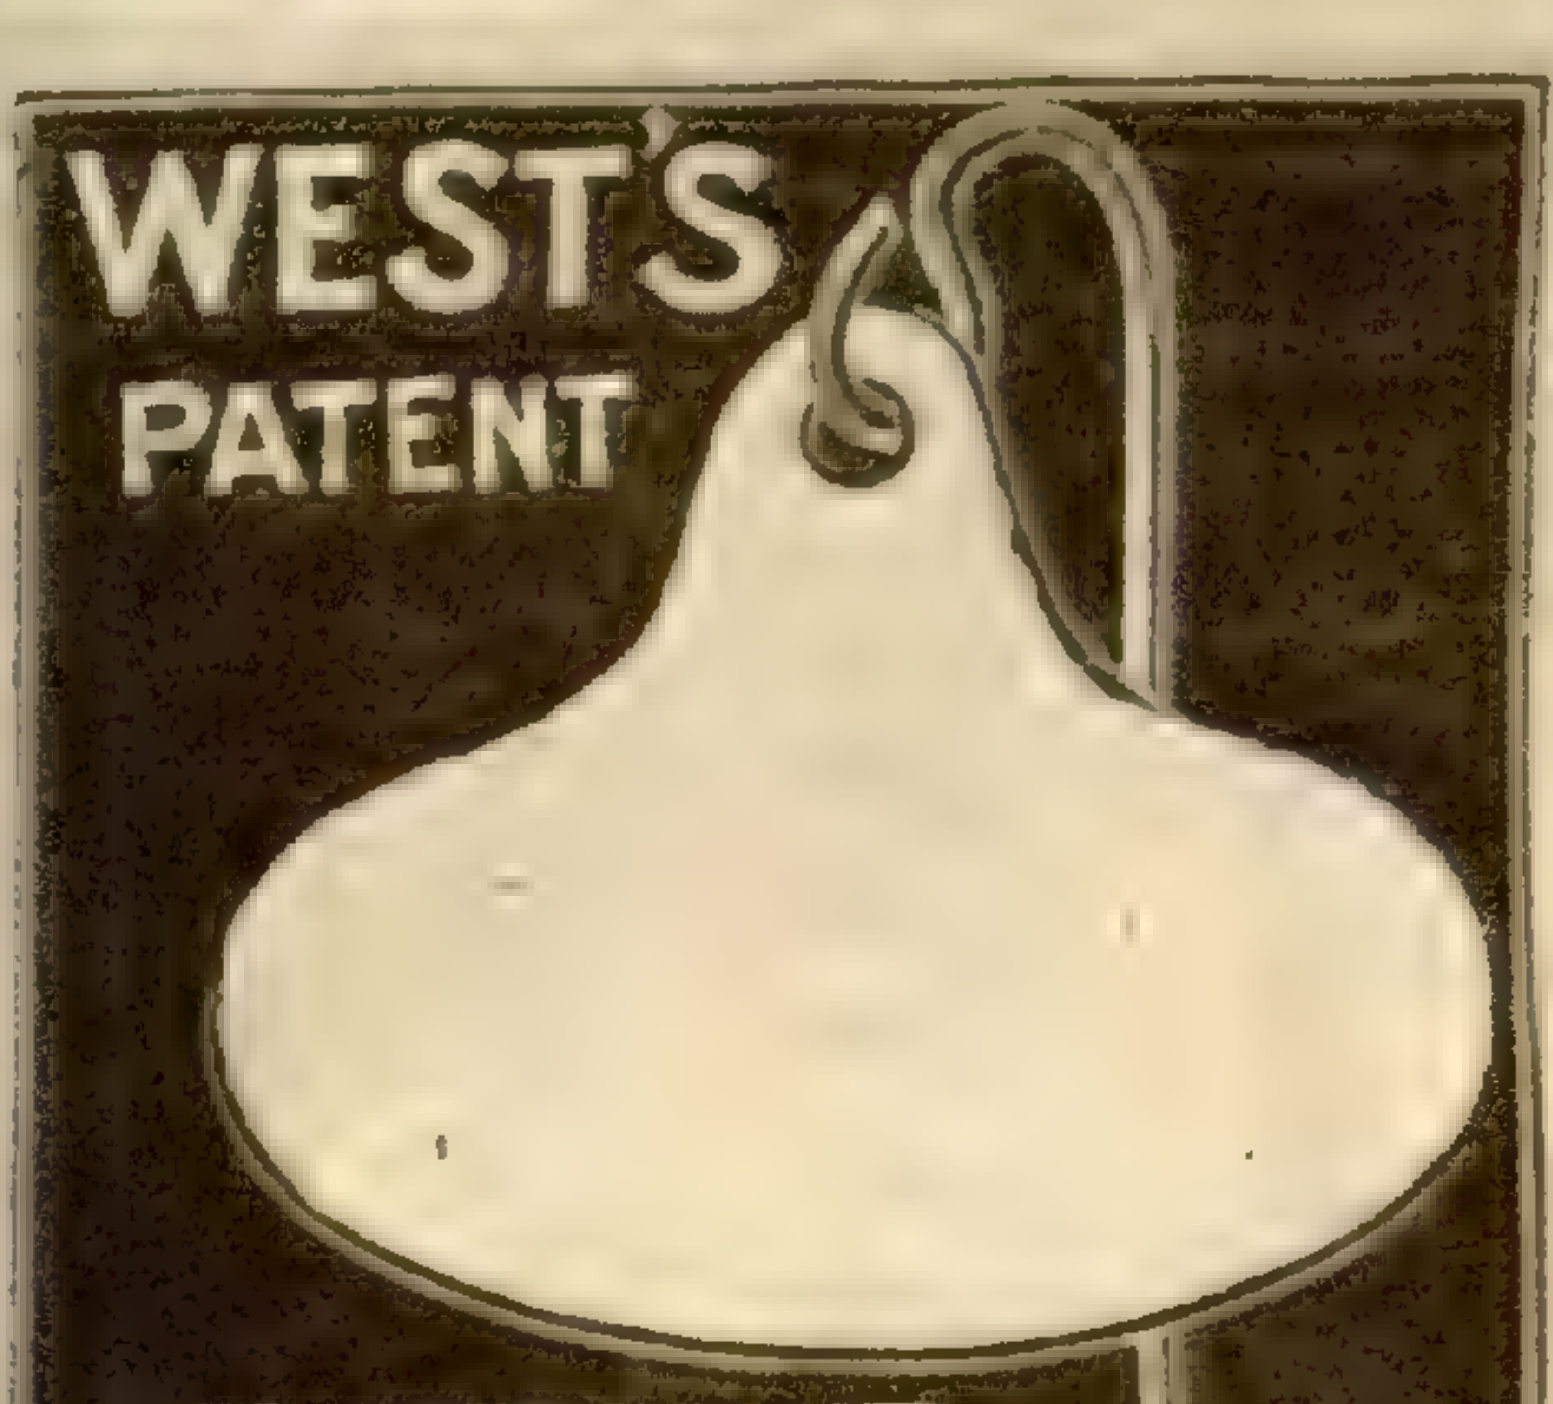
FIELD FLOWERS. By the late SHIRLEY HIBBERD. With Eight Coloured Plates and Engravings, Describing the wild flowers of each month.
Price 3/6.
W. H. & L. COLLINGRIDGE, 148 & 149, Aldersgate St., London

USE PURE ICHTHEMIC GUANO
FOR GARDEN OR GREENHOUSE.
SOLD EVERYWHERE.



THE "IVORINE" WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.
Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.
Supplied by all Nurserymen, Florists, &c.
The LEEDS ORCHID Co.,
ROUNDHAY, LEEDS.

MARKETS.

Covent Garden.

As usual, trade is somewhat quiet after the holidays, so supplies have been shortened a little. Prices are moderate. Cut flower trade dull.

FRUIT.—English grapes, 1s. 3d. to 2s.; Jersey, 9d. to 1s. 3d.; Belgian, 8d. to 10d. per lb.; cherries, 4s. 6d. to 8s. 6d. per half-sieve; gooseberries, 3s. to 4s. 6d. per bushel; raspberries, 3s. to 5s. per dozen punnets; 28s. to 32s. per cwt. in tubs; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 4s. each; French peaches, 10d. to 1s. 4d. per box; English, 2s. to 6s. per dozen; red currants, 4s. to 5s.; black, 5s. to 6s. per half-sieve; apricots, 5s. to 6s. per half-sieve; figs, 1s. to 1s. 6d. per dozen; greengages, 4s. to 5s, per basket; 9d. to 1s. per box; melons, 9d. to 1s. 3d. each; Spanish, 9s. to 12s. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 2s. to 5s.; red roses, 6d. to 2s.; cattleyas, 6s. to 8s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 3s. to 5s.; stephanotis, 1s. to 2s.; lily of the valley, 6d. to 1s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—English tomatos, 4d. to 5d.; Jersey, 3d. to 4d. per lb.; Spanish, 1s. to 1s. 4d. per box; English onions, 2s. to 3s. per dozen bunches; ports, 5s. to 6s. per case; peas, 1s. 3d. to 2s. 6d. per bushel; 3s. to 5s. per sack; French beans, 2s. to 3s. per flat; broad beans, 1s. to 1s. 6d. per bushel; endive, 1s. to 1s. 3d.; cucumbers, 1s. to 3s.; cauliflowers, 1s. 3d. to 2s. 6d. per dozen; mushrooms, 6s. to 8s.; eschalots, 1s. 6d. per 12 lb.; cabbages, 3s. to 4s. 6d.; beetroots, 2s. 6d. to 3s, per tally; lettuce, 9d. to 1s. per score; vegetable marrows, 2s. to 3s. per dozen; mint, 1s. 6d. to 2s.; parsley, 1s. 6d. to 2s.; carrots, 2s. 6d. to 3s. 6d.; turnips, 3s. to 4s.; celery, 12s. to 18s. per dozen bundles; potatos, 3s. 6d. to 6s. 6d. per cwt.

Borough Potato Market.

There is a fair demand at recent prices, but supplies are not large. English Snowdrops, White Beauties, and Early Puritan, 3s. 6d. to 4s.; Beauty of Hebron, 4s. per cwt.

"WE'LL BACK YOU EVERY TIME." A flush of pride suffused the face of the young jockey as he read the telegram. "Let us know each race you start in, and we'll back you every time." The message came from his old-time comrades in far-away Yorkshire. They knew he rode square—rode to win—and their telegram was a testimonial to his integrity and worth. Hundreds and thousands of testimonials to the worth of Holloway's Pills and Ointment as family medicines are in our possession. Many a poor sufferer has been restored to health by these world-famed remedies, and has gratefully written to tell us so. Human friends come and go, but these medicines—the friends of mankind—are always with us in the hour of need.—[ADVT.]

RUSTIC ADORNMENTS
FOR
HOMES OF TASTE,

BY THE LATE SHIRLEY HIBBERD.

New and Revised Edition by the Editor of AMATEUR GARDENING,

"This new and revised edition maintains its position as something more than an ordinary amateur's guide; it is a practical work brought up to date so as to keep abreast of fashion and taste as displayed in the floral decorations of the table, the home, and the garden. This work would make a useful present to anyone."—*The Bazaar, the Exchange and Mart.*

"We cannot imagine a more appropriate presentation book than this to persons who delight in flower and attractive home surroundings. It is worthy a place in any 'home of taste.' It abounds in useful practical hints, and is eminently readable from end to end."—*Journal of Horticulture.*

W. H. and L. COLLINGRIDGE, Aldersgate Street, London.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

HYBRID FRUITS.

CONSIDERING how great has been the success achieved by the hybridist in the domain of floriculture, it is not surprising there should have been a desire on the part of raisers of fruit to create new types by the hybridisation of allied species, and a wish by a section of the community to obtain fruits differing materially from those in cultivation. Such remarkable triumphs have been achieved in the orchid house in the blending of the lælia and cattleya, and other distinct, although related, forms, that we fully sympathise with those who have been anxious to give the world hybrids between the gooseberry and currant, the raspberry and strawberry, and the raspberry and blackberry, and heartily wish they may ultimately achieve a degree of success far surpassing their anticipation. Gooseberries with their fruits arranged in clusters, or red and white currants with fruits largely increased in size, and combining with the piquancy of the currant the richness of the [illegible] finely-flavoured gooseberries, would be valuable additions to our [illegible] fruits. Again, what could be more desirable than a race of [illegible]ries with their fruits borne on stout stems of sufficient height to [illegible] stooping unnecessary in gathering the crop, or to have brambles [illegible] fruits equal in appearance and flavour to the finest of the rasp[illegible]. New types such as these would be of interest, as illustrating the power of man over Nature, and they would be of value to the community in rendering the fruit supplies more varied. But it is evident we shall have to exercise much patience before we possess types such [illegible] of a high order of merit, for as yet but little success has been [illegible] in the hybridisation, as distinguished from cross-fertilisation, of [illegible]. Plants and fruits of the Blackberry-raspberry and Raspberry-[illegible] were exhibited at the meeting of the Royal Horticultural [illegible] on Tuesday, and it would have given us much pleasure to record [illegible] marked distinct advances in the direction indicated. The [illegible] raspberry is described as having been obtained from a cross between the two fruits, which form its name and the appear[illegible] the growth and fruit, fully justify the statement as to its origin. [illegible] the blending of these two fruits has not been so satisfactory [illegible] have wished, for the fruits, which are larger than those of [illegible] blackberry, lack both the piquancy of the latter and the [illegible] the raspberry, and they are so firmly attached to the [illegible] as to render it extremely difficult to separate them. The [illegible] improve in quality in the course of the season, and if we have [illegible] this we shall be pleased to place it before our readers. The [illegible]berry is a species of Rubus of Japanese origin, and bears [illegible] edible, and of so bright a red as to present an attractive [illegible] but, judging from the specimens shown, they possess so [illegible] that the plant will probably only be grown for the interest as[illegible]. The species attains a height of ten or twelve inches, [illegible] bright green leaves, and the fruits are produced singly on [illegible] the apex of the shoots, and have a pleasin appearance.

It appears that the Loganberry, which was raised in America from a cross between the blackberry and raspberry, is not realising expectations in the eastern States, and *American Gardening* describes the flavour as "a combination of the bad qualities of its parents, the raspberry and the blackberry, without the positive good flavour of either."

HYBRID NYMPHÆAS.

THE paper contributed by M. Latour-Marliac to the meeting of the Royal Horticultural Society on Tuesday gave but little information, beyond what we have already published, relating to the crosses by which he has obtained such successful results in the hybridisation of the nymphæas, but contained much useful advice on the culture of the new race of hybrids. In his opening remarks, M. Latour-Marliac directed attention to the fact that but a few years since the water lilies which could be grown without the aid of glass in European gardens were practically limited to the white nymphæas and the yellow nuphars ; and he pointed out that, by the hybridisation of the hardy and tropical nymphæas a wide range of colours had been obtained. The species used in obtaining the Marliac hybrids were N. alba, N. flava, N. odorata, N. rubra, N. Devoniensis, and N. mexicana, and the hybrids had obtained their hardiness from the seed parents, and their beautiful shades of colour from the pollen parents. M. Latour-Marliac has now, he stated, thirty-four distinct varieties, and he believes that forms still finer than those in cultivation will be introduced in due course. Nothing, M. Latour-Marliac observed, could be more beautiful than a group of these hybrid nymphæas, with the dragon flies flitting about their finely developed blooms, and gold fish darting here and there beneath their handsome leafage. Their culture was described as of the simplest, and it was suggested that the climate of England is especially favourable to their full development, as under our cloudy skies the flowers retain their freshness and beauty much longer than when exposed to uninterrupted sunlight throughout the day. To achieve success some knowledge of the peculiarity of the growth of the several forms is necessary, and it is especially desirable to keep a close watch upon those having a spreading growth to prevent them exceeding their allotted space and crowding out those with a more compact habit. As one means of imposing a check upon the vigorous growing and free spreading hybrids, M. Latour-Marliac recommends dividing artificial pools and fountain basins into sections, and having cement divisions about three-quarters the depth of water. He also suggested that the ponds and basins should have sloping sides to prevent the roots having to bear the whole weight of the ice during the winter. Two feet were mentioned as the most suitable depth for the water, and that from running streams was described as the best. Rapid streams were not advised, as water lilies flourish most luxuriantly in comparatively still water, and therefore sufficient additional water to maintain the requisite depth was alone required. The planting may be done in spring and summer, but the month of April was suggested as the best time, as the plants then have an opportunity of becoming established before the season of flowering is far advanced. A bed of soil six inches in thickness was recommended, and in its formation the use of substantial loam, to which a small proportion of well-rotted manure had been added, was advised. All attempts to cross the beautiful blue N. cyanea with the hardy species had failed, but handsome hybrids had been obtained from crosses between N. zanzibariensis and the hardy kinds, but they were not hardy enough to be grown outside in the ordinary way. M. Latour-Marliac had, however, grown them in his nurseries with much success in water in which a current sufficiently sharp to prevent freezing is maintained during the winter months ; but in the cultivation of the tender hybrids he is no doubt greatly assisted by the water from the warm springs which we understand exist in his nurseries.

IMPORTS OF FRUITS AND VEGETABLES.

THE Board of Trade returns for July are in some respects less satisfactory than were those for the preceding month, both imports and exports evincing a decrease as compared with the corresponding month of last year. The diminution is, however, partly due to the fact that there were five Sundays in July this year, as compared with four in the corresponding month of 1897. In the imports the decrease in value was equivalent to 0·6 per cent., and the exports of British and Irish produce and manufactures the decrease was equal to 6·5 per cent. The imports of the products of the garden and orchard show, with the exception of those of cherries, unenumerated fruits and potatos, material decreases both in quantities and values. Apples were received in much smaller quantities than in the two preceding years, the aggregate imports having been 30,739 bushels, of the value of £9,861, or a drop in quantity of 37,725 bushels, and in value of £8,157. Grapes were received in smaller quantities than in July, 1897, the imports amounting to 51,509 bushels, of the value of £27,276, against 167,529 bushels, of the value of £66,245 last year. It is of some interest to observe that in the seven months ending with July the imports of grapes were 65,459 bushels, consequently only 14,000 bushels were received in the first half of the current year. Pears show a remarkable drop, the total imports amounting to 13,621 bushels only, against 114,107 bushels, the values for the two years being £6,082 and £44,995. The imports of plums decreased in quantity by 116,601 bushels, and in value by £103,639, the actual quantities received having been 67,715 bushels, of the declared value of £61,626. Notwithstanding this immense falling off in foreign supplies, and the substantial prices obtained for home-grown fruit, the market growers are grumbling about the competition of the foreign plum orchards with which they have to contend. There is, of course, some justification for grumbling from the growers' standpoint, for were we wholly dependent upon the produce from our own orchards, plums would probably be worth a guinea a bushel in the market, and consequently be beyond the reach of a large proportion of the community. As a set-off to these large decreases mentioned, we have an increase in the imports of cherries of 98,000 bushels, of the value of £57,388, the agregate imports for the month being 190,878 bushels, of the value of £89,546. Unenumerated fruits were also more largely imported, the quantities being 455,159 bushels, against 398,156 bushels last year, of the value of £183,366 and £141,487 respectively. Potatos again show an increase, the imports amounting to 588,969 cwt., and of this immense quantity we received 290,952 cwt. from France, 223,577 cwt. from the Channel Islands, and 73,895 cwt. from countries not specified. The value of the potatos imported during the month was £164,185, and of the imports of potatos in the six months £1,828,534, or nearly £1,000,000 in excess of the sum paid for potatos from abroad in the corresponding period in each of the two preceding years. On the other hand, the imports of onions show a material decrease, the aggregate being 367,133 bushels, against 415,677 bushels last year, but in the seven months nearly 3,000,000 bushels, of the value of £417,780, were imported, which is by no means an inconsiderable quantity of a vegetable that can be cultivated with success in this country.

Changes at Kew.—Several changes have been made at the Royal Gardens, Kew, of late, one of the most important being the removal of the Curator's office. For many years this has been attached to Mr. Nicholson's house, just outside the Curator's Gate, but it has been pulled down, and a more commodious office made at Descanso Lodge, a large house, close to the fire station and at the junction of the Mortlake and Richmond Roads. This house is Crown property, but has hitherto been leased privately; now, however, it has been very largely altered inside, and contains the new Curator's office, the Garden Library for the young gardeners—removed from over the Director's office—and also affords excellent accommodation for the Assistant Curator, Mr. W. Watson, who has moved from his residence by Kew Green, where he has been succeeded by Mr. F. Garrett, foreman of the Greenhouse and Ornamental Department. The old entrance to the Melon Yard, for workmen only, has been closed and built up for some time past, a new gate between Descanso House and the fire station having been opened. With the exception of Mr. W. Irving, foreman of the Herbaceous Department, all the departmental overseers now live practically in the gardens.

Tomato Up-to-Date.—Mr. W. Allan, the able head of the Gunton Park Gardens, who is not less successful in the cultivation of tomatos than of grapes, pears, and other of our principal fruits, regards Up-to-Date tomato with much favour. He has full justification for the high opinion he has of the variety in the remarkably heavy crops in the several houses that are devoted to tomato culture at Gunton. The plants are grown as single cordons, and when we were at Gunton a short time since the plants that were just coming into bearing were regularly furnished with fruit from within a few inches of the base to the apex, and the total weight of fruit that will be produced by them will be simply prodigious. The fruits of Up-to-Date are smooth, brilliant red, and produced in clusters of from six to nine each, the weight of the individual fruits ranging from four to five ounces each, and are consequently of the size so much appreciated on the table. The variety has a hardy constitution, as proved by the fact that last autumn the plants that were grown in an unheated structure with other varieties were in no way injured by a severe attack of disease which did much damage to the plants of the whole of the other varieties. Up-to-Date originated in the neighbourhood of Norwich a few years since, and has been grown at Gunton somewhat largely from the first, consequently Mr. Allan has had plenty of time in which to formulate the high opinion he has of the variety.

Reserve Food of Plants in Winter.—A most interesting study has been made of the winter condition of the reserve food substances in the stems of certain deciduous trees by Mr. E. M. Wilcox, and the results given in the American *Journal of Science*. Specimens of liriodendron collected in October were found to have an abundance of starch in the cells of the cortex, but none in the cells of the medullary sheath, and but few grains in the cells of the wood parenchyma and medullary rays. The cells immediately below the growing point of the stem contained no starch at this time. November and December showed a gradual increase in the amount of the starch in the medullary sheath, but a marked decrease in the amount present in the cortex. At the end of February starch began to appear again in the cortex, but more especially in the cells immediately below the growing point.

Forcing Foxgloves.—We are so accustomed to seeing the foxglove beautifying our woodlands and the less highly dressed parts of the pleasure grounds, that many of our readers will probably learn with surprise that in the south of France they are forced for indoor decoration early in the year. According to our esteemed contemporary *Le Jardin*, the practice of forcing the varieties of Digitalis purpurea originated with M. Jules Van der Daele, chief of the Casino Gardens at Monte Carlo, and that as the result of the practice he was able to exhibit at the flower show held in Nice in March last a collection of admirably flowered plants, which produced a very beautiful effect, and were much admired by visitors. It appears that the foxgloves are potted up in September or October in six-inch pots, three plants in each, and a very rich soil is used. After the potting the plants are placed in some convenient position, and in November they are removed to a glass structure, in which they can have the assistance of a temperature ranging from 55 to 60 degrees Fahr. When the plants begin to make new growth care is taken to place them near the glass, if they were in the first instance some distance from it, to ensure a short, firm growth and well-furnished spikes of flowers, the latter making their appearance in from twenty to twenty-five days. Our contemporary suggests that forced foxgloves are deserving of the attention of the growers for market, and expresses the opinion that well-flowered examples would find a ready sale at a good price.

Bishop's Park, Fulham, would cost, it was estimated, £35,245 to acquire and lay out. Towards that cost the London County Council gave £5,000, and promised a further £7,500 toward the extension and completion of the park. The Parks and Open Spaces Committee recently proposed, and the Council agreed, to add £5,000 to the already promised amount, thus making a total of £17,500 paid to the Fulham Vestry for the provision of this open space.

The Jersey Potato Crop has this year fallen below the average of the past ten years, both as regards quantity and price. A statement made by Mr. Philip Barbier, Notary Public of St. Heliers, shows that the total output was 56,227 tons, realizing £338,269, or an average of £6 0s. 4d. per ton. The highest prices were naturally obtained for the earliest shipment—thus, the 160 tons shipped during the week ending May 7 realized £24 9s. 6d. per ton; during the week ending May 28, 3,667 tons were dispatched from S. Heliers, and these fetched £12 6s. per ton; the 550 tons sent away during the week ending July [illegible] only realized £2 17s. 6d. per ton. The largest output for one week was 11[illegible] tons, shipped from July 11 to July 18. The shipments commenced later than usual, for those of 1897 began on April 19, and in 1896 on April 3. The lateness affected the starting price, as the Scilly Isles and the coast of Cornwall were ahead of Jersey to a considerable extent this season. They are ahead in the majority of years for outdoor potatos; but when they are sending large quantities of tubers to market at the time of the start in Jersey, prices begin comparatively badly for Jersey growers, and fall quickly. The earliest price was only a few shillings per ton lower than it was in 1897, but in 1896 it was £32 a ton, and in 1895 it was £45. The average price per ton in recent years was £7 10s. 3d. in 1897, £[illegible] 14s. 9d. in 1896, £6 12s. 7d. in 1895, and £7 12s. 9d. in 1894. The Jersey potato crop of 1897 was grown on 8,076 acres, and if the area was about the same this year, the quantity shipped was nearly seven tons per acre, and the return [illegible] £41; besides which there was the home consumption in the island for food and seed. But in 1897 the return from shipments averaged nearly £50 an acre, and in 1896 over £58. Many Jersey growers have to pay £10 per acre for land for early potatos, and labour and manure brings up the cost to about £30 per acre. In many instances, however, forage crop is obtained in the same year after the potatos.

Presentation to a Distinguished Scotch Gardener.—A few days since Mr. William Henderson, the able gardener at Balbirnie, Markinch, Fife, was presented by the officials of the Markinch Cottage Gardening Society with a beautiful gold keyless stop watch and albert, for himself, and an elegant [illegible] cake-basket for Mrs. Henderson. This presentation was made by the wish of all classes in acknowledgment of his services to the society during the last twenty-[illegible] years, and such is the assistance given that, whereas in 1873 the takings on show days only amounted to about twenty-five shillings, the society is now able to expend in prizes and management the sum of £200, and this in a village of 1,[illegible] inhabitants and a thinly populated adjacent neighbourhood. The [illegible] (Provost Dixon), in making the presentation, alluded in eulogistic terms to Mr. Henderson's ability, more especially as a superintendent in the ex[illegible] and those who have been associated with him fully endorsed the [illegible] remarks. In expressing his thanks, Mr. Henderson said his services were always at their command, and, while thanking them for the magnificent gifts, which he was justly proud of, he more highly appreciated their confidence and [illegible]

The Cultivation of Beet in Denmark both for sugar [illegible] increased wonderfully of late years, until now the area under [illegible] 161,601 tonder, a tonder being equal to 1·363 English acres. It is estimated [illegible] for sugar production an area of about 34,000 acres is under [illegible] increase has led to the establishment of a sugar factory at Maribo. [illegible] area under beet cultivation in Denmark has increased by 68 per cent. since [illegible] During the past ten years or so woodlands have increased [illegible] trees, principally in Jutland, the area has risen from 74,000 to [illegible] Like Holland, Denmark has done a good deal of reclaiming during [illegible] and during that period has probably increased its cultivatable [illegible] tonder. Most of the land reclaimed from the sea is attached to the [illegible] and is now producing grain and grass.

The Ceylon Botanic Gardens at Peradeniya have been [illegible] useful during the past year, under the directorship of Mr. J. C. Willis. [illegible] number of experimental plots of economic plants have been planted. [illegible] for seeds of the Para rubber (*Hevea brasiliensis*) was enormous during [illegible] from a total crop in the gardens of 100,000 seeds some 88,500 were [illegible] planters. Circulars on horticultural, agricultural, and botanical subjects have been issued from time to time with a view of bringing the public more into touch with the department; two of these dealt with a disease that attacks the Cocoa tree (*Theobroma cacao*). This disease is caused by a fungus not yet determined, but which produces canker both in the stems and roots of the cacao. Camphor trees grow well in Ceylon, for plants distributed in 1895 to the Hakgala and Galle districts have respectively attained heights of nine and twelve feet.

Honours for Horticulturists.—On the occasion of the distribution of prizes to the members "de l'Union francaise de la jeunesse" M. Alphonse Gourlot, administrator of *Le Jardin* and professor of horticulture to the union, and M. A. Morgand, professor of agricultural chemistry, received the decoration of Chevalier of the Merit Agricole. By a decree dated July 25 fifteen gentlemen were appointed to the grade of Officer and sixty-eight to the grade of Chevalier of the same order. The majority of the gentlemen appointed to each grade were horticulturists.

Bulgarian Tobacco.—Agriculture is the chief industry of the Bulgarian Principality, affording occupation to not less than 70 per cent. of the people. About 23 per cent. of the land is occupied by cultivated gardens, vineyards, and farms, while a further 73 per cent. is composed of meadow and pasture lands and forests. Next to cereals the chief production of Bulgaria is tobacco, chiefly grown in the districts of Haskovo, Phillippopolis, Kustendil, and Silistria. It resembles the well-known quality of Turkish tobacco known under the name of Yénijé. The peasants are free to cultivate the plant, but the preparation and sale of tobacco are controlled by the State, which, however, with the view of encouraging exportation, returns all dues paid on tobacco which is afterwards exported. An opportunity of testing Bulgarian tobacco was afforded us at the Antwerp Exhibition of 1894, and we pronounced it good. In cereals, tobacco, and otto of roses Bulgaria has three profitable industries, and the Government is doing its duty to the best of its ability in encouraging and fostering them.

Management of Epping Forest.—The cost of the maintenance of Epping Forest is very clearly shown in the accounts relating to Epping Forest for the year 1897, which have recently been published by the Corporation. The receipts amounted to £6,832, including a contribution of £4,650 from the Corporation out of the Grain Duty Fund. Rents brought in £506; licences and tolls, £456; marking cattle, £89; sale of wood thinnings, £643; contributions by residents and Leyton District Council towards improvements at the Hollow Pond, Leytonstone, £431. The disbursements were in all £7,069. Rents, rates, &c., absorbed £337; salaries to superintendent, keepers, reeves, and staff, £2,011; police services, £58; cost of improvements at the Hollow Pond, £1,228; artificers' work, £699; and cost of wood thinning, £685.

July Rainfall.—July has long been considered one of the wettest months of the year, no one regarding a fall of an inch of rain during a single good electrical disturbance as anything very extraordinary. The present summer, however, has departed from the usual course, and that instead of being a thundery, wet month, July proved quiet and dry; indeed, seldom has it been so universally dry, for the returns show that in no locality within the bounds of the United Kingdom has the rainfall amounted to the average. Taking the country as a whole, July ought to produce about three inches of rain, while last month yielded barely an inch. Eighteen out of thirty representative stations had less than an inch, the total quantity measured on Belfast Lough and the Mersey, and on the coasts of Devon and Kent, being under half an inch, and the Scilly Islands had to do the best they could with just a quarter of an inch, which is only ten per cent. of the usual allowance for these islands. There were several other districts with less than twenty-five per cent., the Hebrides, lying in the path of all the rain-bearing disturbances from the Atlantic, alone boasting of as much as eighty per cent. of the normal. Over the greater part of the country rain was experienced on only from three to ten days. The heavy deficiency thus indicated for the month increased the loss which had been shown for the first half of the year, the west of Scotland and the southern half of England being from four to five inches in arrears. Most other regions were at the end of July from two to four inches short, but the north-west of England has had the average amount, and the north of Scotland an excess of six inches. In London we had rain on seven days last month, but the quantity of water deposited did not aggregate three quarters of an inch, the average being two and a-half inches. During the seven months ending with July the metropolis had only eighty-seven rainy days, and the total fall of eight inches and a-quarter has to be compared with the usual average of over thirteen inches, so that we are at the present moment nearly five inches below the average. The heavy rains experienced over a wide area on August 6 and the two following days have done something towards restoring the balance, and assisting fruit trees and the various garden and farm crops in need of increased moisture at the roots.

Mr. Peter Barr, founder of the firm of Barr and Sons, Covent Garden and Long Ditton, is touring round the world, as our readers have already been informed. He was recently at Quaker City, and is described by a writer in an American contemporary as a hale and hearty gentleman who, although he has passed the seventy-third milestone, thinks he is young enough to begin a tour of the globe, which he expects to complete at the Paris Exposition of 1900, and that unaccompanied. This is unnecessary, as his genial face will obtain him an "open sesame" wherever he goes, excepting Spain, for I am afraid she may have heard how he has so favourably expressed himself towards Uncle Sam. It is many years since the worthy gentleman climbed the mountains of Spain in search of the golden daffodil which, among the many other well-known bulbous plants, has made him famous. The writer well remembers visits paid to the store in Covent Garden when Mr. Barr was the Queen Bee of the hive, and congratulates him that he is now able to enjoy the honey gathered there.

Window Gardens.—Writing in advocacy of extending and improving window gardening in the metropolis, Sir H. Maxwell, Bart., M.P., observes: Nothing less than the precession of the equinoxes can ever render London an open-air city. That "Queen's weather," which made the Jubilee summers of 1887 and 1897 memorable among decades of fitful or adverse seasons, would enable us, could we count on it, to give ourselves al fresco airs, to line our pavements with café chairs, to dine and sup under the stars, and use our houses only for work or sleep; but, as things are, we have to pay the penalty of disregarding the obvious lesson of Nature, so long as we persist in swarming into London when it is least habitable, instead of putting off our work and amusement there till winter, when coal fires make the town comfortable. Ebbene! if we can't end it we might surely mend it, by importing summer finery in more liberal measure into our streets. Window-boxes—why are they so few? Partly because people who take a house for a few weeks or months often grudge the expense of furnishing them. The mode prescribes table decoration on a liberal and costly scale; many a dinner table is decorated at a price that would fill every window of the street front with flowers; flowers, too, that would give pleasure, not for a couple of hours to a score of indifferent guests, who care more for the plats than the parterre, but to every dweller in the house and every passer-by in the street; flowers that would not wither in a night, and add to the morning's mass of decaying refuse, but living flowers that would flourish till the autumn frosts, each green leaf doing its work in sweetening the atmosphere for a million pairs of lungs. Be it far from any one to discourage the flower trade; may it long flourish, pretty and prosperous! Only, if there is money to spend on it, shall it all be on flowers for a night, and not part of it on flowers for a season? From my writing table I have across my flowerless sill a view of twenty-four houses over the way, in some of which I have partaken of liberal hospitality at tables. But only two out of these four-and-twenty houses display growing flowers in the windows. Fashion is conveniently impersonal; let us lay the blame on her, and reflect if we could not get more lasting enjoyment out of our flower bills—for ourselves and, less selfishly, for the man in the street.

Professor E. Ray Lankester has been appointed successor to Sir William Flower as director of the Natural History Museum at South Kensington.

Scarcity of Summer Insects.—One effect of the prolonged cold of this year's ungenial spring is to be seen in the remarkable scarcity of many of the familiar summer insects. Wasps are less plentiful this season than they have been for many years, and the absence of butterflies is not less remarkable. One may spend day after day in remote country places, where the summer air is generally dancing with them, without seeing more than a very occasional specimen, even of the most common varieties. The gorgeous autumn butterflies may yet come out in their usual numbers, but the more familiar browns and exquisite little blues and coppers, without which the midsummer meadows and hedgerows look curiously lifeless, have been greatly diminished in number.

Plant Exchanges.—The authorities of the Museum d'Histoire Naturelle de Paris have issued a list of the hardy and greenhouse plants they offer to botanic gardens in exchange for plants which are required in the establishment.

Italian Importation of Manures.—Through Genoa, its principal port, Italy imported fifteen thousand tons of manure during 1897, this consisting chiefly of phosphates and guano. Of this quantity America sent 7,735 tons, Germany 4,307 tons, and Austria 2,826 tons. The total importation was valued at £95,738, as against £101,024 for 15,785 tons in 1896.

A Cure for Corn Smut.—Mr. T. L. Jensen, of Copenhagen, has for a considerable time carried out experiments with a view to effectively combating the attacks of the various "smuts" or "rusts" that attack corn crops, and he now claims to have discovered a suitable medium which is called "Ceres Powder." Both grub and smut are combated successfully, the crop is increased, and weeds decreased by its use. Notwithstanding that Mr. Jensen had made numerous experiments during former years upon crops raised from seed prepared with this powder, he thought it would be best to have a large number of systematically planned experiments carried out by practical farmers without his direct co-operation. These experiments, to the number of fifty-seven, were duly carried out, each taking an average of four hundred and twenty English square yards, and the results obtained are comprised in the following main points: 1. The number of smutted ears of corn was decreased to nearly one-fifth through the steeping of oats and barley. 2. The weeds were decreased by about three hundred kilos. per hectare (=2·47 acres). 3. The value of the crop was increased through the steeping of oats and barley by, on an average, of 23s. per hectare. It is therefore computed, says Consul Boyle, that if the whole of the seed sown in Denmark, amounting to about 844,400 hectares of oats, barley, and matured meslin were steeped in Ceres, it would increase the net revenue from Danish agriculture by nearly £1,000,000 sterling. The Ceres powder can also be used with advantage against diseases which attack all roots, and materially increases weight. Ceres powder is not sufficiently effective against smut in wheat and rye, but to these another material, called "Ceres Steep," is applied.

The Manufacture of Sugar from Beet goes on apace in the United States. In the Portland district of Oregon, it having been proved that the soil and climate are suitable for the cultivation of sugar beets, arrangements have been made to erect a refinery at La Grande, in Union County, by Utah capitalists interested in the refinery at Los Alimetos, California, and it will be a duplicate of that factory, to cost £80,000. It is estimated to consume 350 tons of beets, and to turn out 35 tons of granulated sugar per day with a season of 100 days. Professor Shaw says the average for sugar beets is two per cent. more sugar in juice than in California. The factory has contracted with farmers to grow annually for five years 3,000 acres at four dollars (16s.) per ton. This business might be worthy of consideration by English capitalists, and is capable of great extension.

New Plants, Flowers, and Fruit.

On July 27 the Floral Committee of the Royal Horticultural Society met at the Chiswick Gardens to examine the extensive trial of annuals there conducted, and also to make such awards as seemed necessary to meritorious annuals, cannas, sweet peas, carnations, and violas. A large amount of work was done, and the committee awarded three marks to quite a number of subjects. The carnations were all seedling forms, raised from seed sent by Mr. J. Douglas, and now flowering for the second time at Chiswick; the names were given by the committee. Judging from the amount of layering that is being done now, we presume the Council intends to place carnations upon the next distribution list.

Cannas.

La France.—This has immense flowers, nearly six inches across, with broad, drooping segments; the colour is deep carmine, heavily veined and shaded with crimson scarlet; the foliage is dark purple. × × × at Chiswick, July 27. Messrs. J. Veitch and Sons, Chelsea.

Reichskanzler Furst Hohenlohe.—A handsome large-petalled variety, with pale lemon-yellow ground colour, freely shaded and streaked with golden yellow; the small segments in the centre are speckled with vivid scarlet. × × × July 27. Messrs. J. Veitch and Sons.

Hofgartendirector Wendland.—A most brilliant crimson-scarlet flower, with golden margins to the segments; fine truss and bold flowers. × × × July 27. Mr. Pfitzer, Stuttgart.

Chiswick King.—This is a very handsome and large-flowered canna, raised at Chiswick by Mr. S. T. Wright, the society's superintendent. It has very broad petals that are of a very rich and deep orange-scarlet colour suffused with crimson. Segments bold and substantial. × × × July 27. Royal Horticultural Society.

Antirrhinums.

Dwarf Yellow is a fine strain, the plants making bushy specimens, growing about twelve or fourteen inches high, and bearing sturdy spikes of large and deep yellow flowers. × × × July 27. Messrs. J. Veitch and Sons.

The Moor is a dwarf-growing antirrhinum bearing long spikes of very deep and dark crimson flowers. This and the above provide a strong contrast. × × × July 27. Mr. W. Marshall, Bexley.

Violas.

Marchioness.—A lovely white bedding variety with small, yellow eye. The flowers are almost entirely rayless; fragrant and free. A.M., R.H.S., July 27. Messrs. Dobbie and Co., Rothesay, and Mr. J. Forbes, Hawick.

The Mearns.—This is a well-known variety, with the three lower petals rich violet-purple, and the upper two soft lilac shaded with violet. × × × July 27. Mr. Forbes, Hawick.

Bridegroom.—A very pretty viola, lilac with deeper veins, rayless, yellow eye, very free and dwarf. × × × July 27. Mr. J. Forbes.

Gipsy Queen.—A curiously streaked variety, having irregular bluish markings on a white or pale bluish ground. A variable form. × × × July 27. Messrs. Dobbie and Co.

Border Carnations.

Firefly, rich rosy-scarlet, a soft shade; very fine and vigorous.

Rosy Morn, a pretty flower, fringed petals, deep rose, with a distinct red suffusion.

Cygnet is pure white with a silvery hue; very fragrant and free, and a non-burster.

Black Douglas is an intense marone-crimson flower, fringed edges, and a non-burster.

Goletta is very distinct and effective, broad petals, white, heavily flaked and streaked with deep rose and soft red.

Lady Primrose is well named, the flowers being of a pretty primrose-yellow shade; very free and strong. × × × to each, at Chiswick, July 27. Mr. James Douglas, Great Bookham.

Candytuft Rose Cardinal.

This grows about twelve inches high, and makes pretty bushy plants that carry an abundance of deep rose-coloured flowers on stout trusses. × × × July 27. Messrs. Watkins and Simpson.

Eschscholtzia Mandarin.

A brilliant annual, growing about fifteen inches high and carrying a wonderful crop of deep orange-yellow flowers. × × × July 27. Messrs. Watkins and Simpson.

Gypsophila elegans.

This is pure white form, producing its stellate flowers on graceful and light growths. × × × July 27. Messrs. Watkins and Simpson.

Papaver Danebrog.

A large-flowered poppy, with the base of the flower white and the upper part deep scarlet; very effective; about two-and-a-half feet high. × × × July 27. Messrs. Watkins and Simpson.

Poppies.

Cardinal has big double scarlet flowers lightly striped with white; the prominent petals are laciniate. This grows about one and a-half feet high. × × × July 27. Messrs. Watkins and Simpson.

White Swan, very handsome, double, and with immense full and pure white blooms; two and a-half feet high. × × × July 27. Messrs. Watkins and Simpson.

Leptosiphon roseus.

This is a pretty dwarf annual with pretty and narrow leafage, and bearing a profusion of small but brilliant rose-coloured flowers. The plants form dense specimens about four inches high, and these are admirably suited for bedding or carpeting. A.M., R.H.S., July 27, at Chiswick. Messrs. J. Veitch and Sons, Chelsea.

Clarkia elegans rosea.

A handsome double-flowered annual, producing masses of brilliant rose-coloured flowers. It grows about eighteen inches high, and is altogether a first-rate plant. × × × at Chiswick, July 27. Messrs. J. Veitch and Sons, Chelsea.

Godetias.

Rosea alba, a fine form growing about eighteen inches high, and bearing a profusion of flowers that are of a delicate and soft rose hue save for a dark rose zone round the eye. × × × at Chiswick, July 27. Messrs. J. Veitch and Sons.

Gloriosa is a dwarf form, not exceeding a foot in height; flowers large, dark crimson with central purple shading. × × × Messrs. J. Veitch and Sons.

La Belle is less than a foot high and carries a profusion of dark, red-purple flowers shaded with rose. × × × July 27. Messrs. J. Veitch and Sons.

Butterfly is a lovely white variety with crimson blotches. × × × July 27. Messrs. J. Veitch and Sons.

Whitneyi grows about fifteen inches high, and has dull crimson flowers, tinged in the centre with rose. × × × July 27. Messrs. J. Veitch and Sons.

Brilliant has deep and bright crimson flowers, each having a white eye. This grows about ten inches high. × × × July 27. Messrs. Watkins and Simpson.

Fairy Queen produces its white flowers, blotched with red, in great profusion. It is a very dwarf variety of great merit. × × × July 27. Messrs. Watkins and Simpson.

Duchess of Albany has delicate rosy-blush flowers when first expounded, but these soon turn white; a very free form. × × × July 27. Messrs. Watkins and Simpson.

Viscaria cardinalis fulgens.

This is a very pretty annual that deserves more extended cultivation. The blooms are of a deep and handsome crimson scarlet hue and produced with the utmost freedom. × × × July 27. Messrs. Watkins and Simpson.

Alyssum maritimum minimum.

A very dwarf annual, about four inches high, spreading habit, and covered with white flowers. × × × July 27. Messrs. R. Veitch and Sons, Exeter.

Cypripedium Olivia.

A pretty hybrid with pink petals that are lightly dotted with purple and veined with deep rosy-red. The broad dorsal sepal is white at the apex and sides, has a greenish central tinge, and upright lines of reddish-rose. The full lip is almost white, the upper surface being flushed and veined with rose; the infolding lobes are heavily speckled with red. The plant is the result of crossing C. tonsum with C. concolor, the former being the seed parent. A.M., R.H.S., August 9. Messrs. H. Low and Co., Enfield.

Sobralia Sanderiana.

A very fine sobralia with soft lilac sepals and deep purplish rose petals. The lip is large, having an intense orange throat surrounded by a fine broad border of deepest rose, suffused with rich rosy-crimson. A.M., R.H.S., August 9. Mr. Ballantine, gardener to Baron Schröder, Esq., The Dell, Egham.

Vanda Batemanni.

This stately plant is not often seen in flower; it has a long, erect scape that will carry as many as twenty flowers, these expanding in succession from the base upward. The flowers are about two and a-half inches across; the petals are thick, rather narrow, fleshy, falcate, yellow, spotted with crimson, but purplish at the back. The sepals are similar in shape and colour. Lip triangular, purplish-crimson with a ridged and incurving front lobe. The flowers continue in good condition for a very long time. A.M., R.H.S., August 9. Mr. C. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate.

Carnation Nox.

A very fine self or border variety, with large shapely blooms of the most intense blackbird-crimson colour, a shade that suggested the name of the variety. A.M., R.H.S., August 9. Mr. James Douglas, Edenside, Great Bookham, Surrey.

Nelumbium nuciferum speciosum.

This has huge double flowers of a soft creamy-white colour. The outer row of segments are very broad, but the numerous petaloid stamens are much smaller and less shapely, but make up a full flower. The leafage is very large and bold. F.C.C., R.H.S., August 9. Mr. O. Thomas, Royal Gardens, Windsor.

Gladioli.

W. B. Child—A handsome form, with rich, rosy-scarlet flowers, the lower segments having very decided scarlet shading, while the lip has a creamy base. A.M., R.H.S., August 9. Messrs. Kelway and Son, Langport.

Lemoinei Vesuvius.—A very sturdy and showy form, with broad and rounded segments of a rich blood-red hue, shaded at the base with yellowish-orange.

Lemoinei Baron J. Hulot.—A most distinct form, with violet-blue flowers; the lower segments are heavily suffused with intense purple blue. A.M., R.H.S., August 9, to each of the last two. Mr. M. Prichard, Christchurch.

Furcræa Watsoniana.

A handsome plant with leaves nearly two feet long and three inches broad. The centre of the leaf is greyish-green, with a border of creamy-white on each side; then comes a bright green area and other longitudinal stripes of creamy-white. The plant is vigorous, very distinct, and most handsomely marked. F.C.C., R.H.S., August 9. Messrs. F. Sander and Co., St. Albans.

Nymphæa ignea.

One of the darkest or deepest coloured varieties of the new race of hardy water lilies. It has fairly large flowers that are of a deep and handsome crimson colour when fully expanded; the outer segments are very dark rose tinted with crimson, the inner and smaller ones being the most finely coloured. A.M., R.H.S., August 9. Mr. J. Garrett, gardener to A. B. Freeman-Mitford, Esq., Batsford, Moreton-in-the-Marsh, Gloucester.

Cypripedium Mrs. Reginald Young.

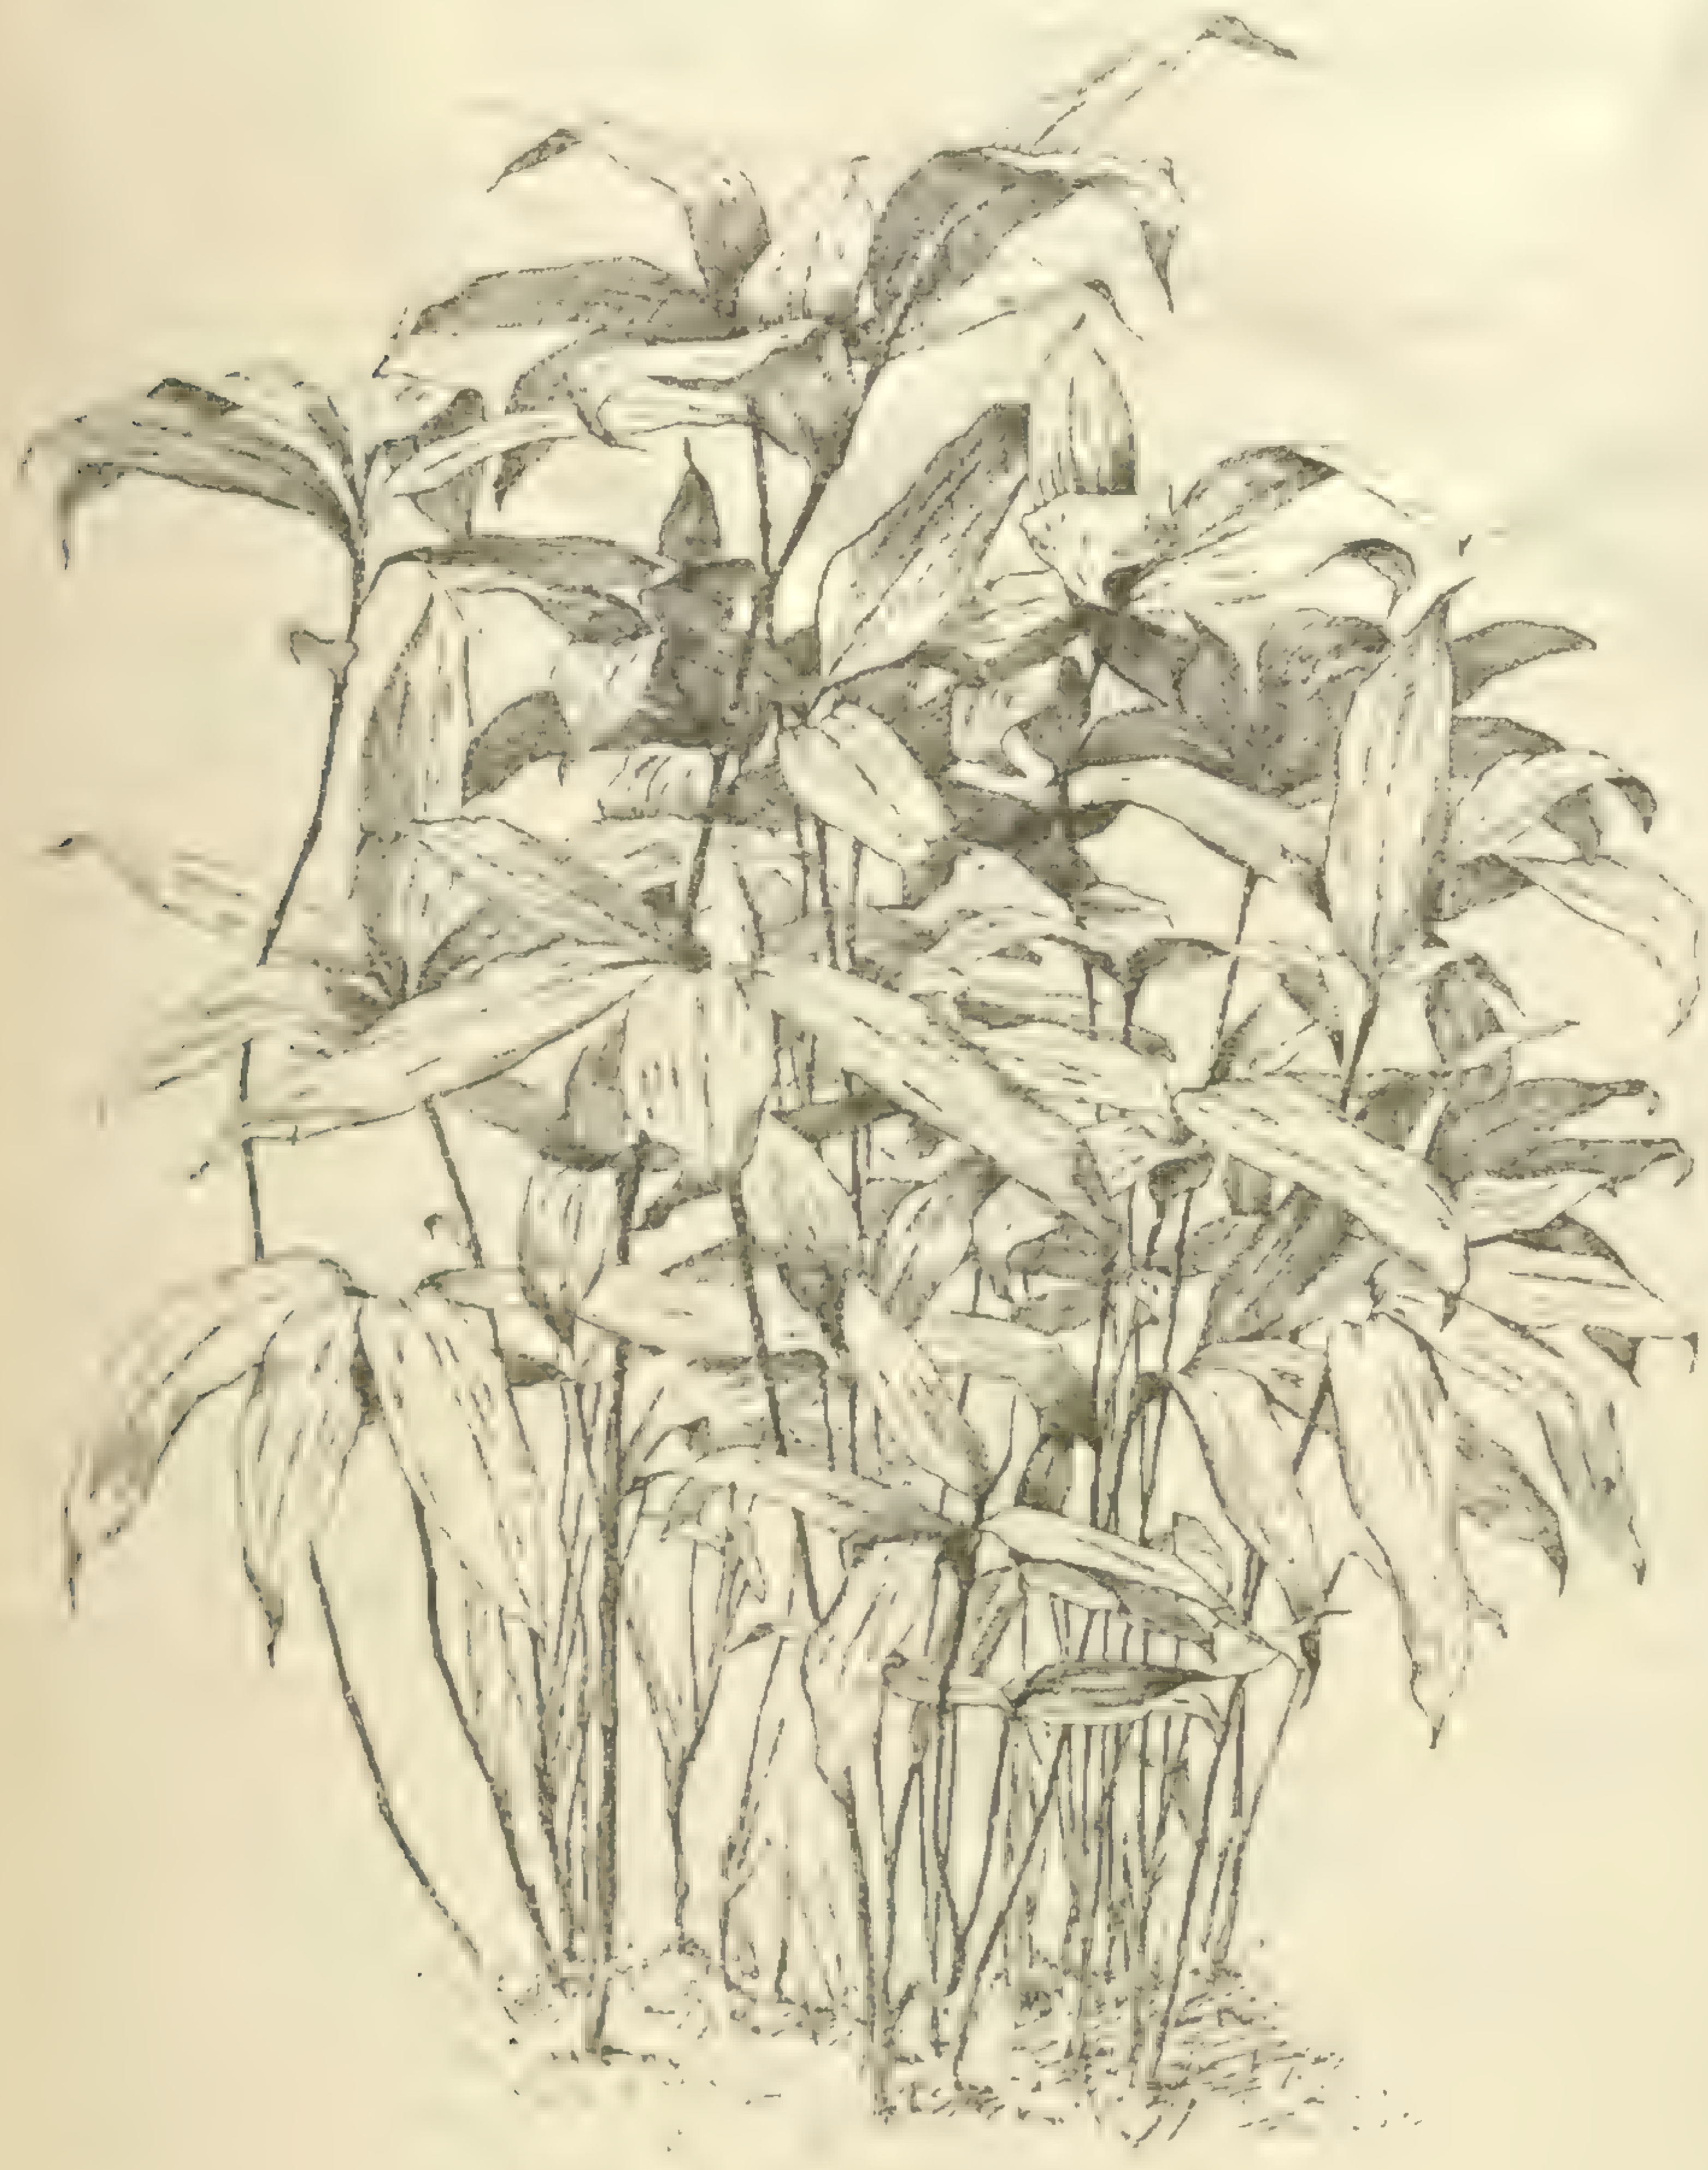
An extremely quaint and yet handsome cypripedium, obtained by crossing C. Lowi with C. Sanderiana. Two flowers were borne on the one long spike, and their long drooping petals were great attractions. The petals are about half an inch broad and eight or nine inches long, curving outwards, and then drooping down, slightly twisted; greenish white at the base, but rosy-crimson for the rest of its length; marked throughout with deep crimson. Petals bright green, with longitudinal bands of deep claret purple. The short but broad and [illegible] coloured with rather bright brown upon the face, but this colour fades into rose below and behind; column green and hirsute; a very wonderful hybrid. F.C.C., R.H.S., June 28. Messrs. H. Low and Co., Bush Hill Park, Enfield.

Armeria cæspitosa.

This is a curious and pretty little Spanish thrift, a densely-tufted perennial about four inches high, producing its heads of rose-coloured flowers very freely during April. Though described by Ortega in 1762, the species does not appear to be very widely known even now, and yet it is a charming little rockery plant. The narrow, recurving leaves are plentifully produced, and are about two-thirds of an inch long, ending in a sharp white tip. The individual flowers are fairly showy and large, being half an inch broad; the five petals are obovate-spathulate, two-lobed at the broad apex, and of a pretty pale rose shade. *Bot. Mag.*, t. 75[illegible].

ARUNDINARIA METALLICA.

INCLUDED in the comprehensive and admirably grown collection of bamboos contributed by A. B. Freeman-Mitford, Esq., C.B., to the meeting of the Royal Horticultural Society, held on July 26th, were several new and rare species which deservedly obtained recognition from the Floral Committee. These new forms are enumerated and described in the GARDENERS' MAGAZINE of July 30th, and we give herewith a characteristic figure of Arundinaria metallica, a dwarf growing and handsome species, remarkable for its hardiness, which received an award of merit. As so well shown in our illustration, it is somewhat similar in character to A. palmata and A. Veitchi; and it has stout culms, with dark grass-green leaves, about an inch and a-half in breadth, from eight to nine inches in length and acutely-pointed. The most important characteristic of this form is perhaps its hardy constitution, and in proof of its adaptability for cultivation in districts where the climatic conditions are not specially favourable to bamboos, Mr. Freeman-Mitford informs us that in the gardens of his residence—Batsford Park, Moreton-in-the-Marsh, the leaves do not become browned during the winter, as in the case of the majority of the species, and that [illegible]hes in the northern islands of Japan, where the two closely allied forms, A. palmata and A. Veitchi, are unable to exist in consequence of the severe weather experienced at certain seasons of the year.



ARUNDINARIA METALLICA.

Protection of Birds.—The Committee of the Society for the Protection of Birds has issued a circular letter urging landowners, shooting tenants, and farmers to use their authority with their keepers and others to prevent the free destruction of birds on their land, and to give instructions as to what birds only may be destroyed, which, in the words of the circular, "should properly be only those birds that, from their abundance in any particular district, may do real harm."

Onions for Seed Production.—In planting a dozen bulbs of nearly as many assumed diverse varieties, flat, round, oval, and crimson, all in a lump, just to enable insects to work their will with them in the labour of inter-crossing, I may have done a wrong thing; but I am not at all certain that any good results from the increase of names, called variation, that goes on yearly. Any one variety of [illegible] brown or yellow onion, round or globe shaped, will always give two or [illegible] forms that may be termed distinct, yet all from the same stock. What, then, is the good of names? I may get from out of my mixture of varieties some interesting combinations, but it would be absurd to name them in any case, as [illegible] and variation would go on for years. Also, if from such a mixture a [illegible] raises all sorts of forms and colours, he is much more likely to obtain from [illegible] intermingling bulbs that would give him round ones over a long season than would be the case where they are all one variety. But, all the same, I have [illegible] the finest bulbs of the various forms I could get. It is now fully recognised that the larger the bulb the finer will be the stock its seed will produce. That is [illegible], apart from modern exhibition requirements, why large bulbs are now so widely and so splendidly grown; whilst, as a rule, the larger roots of any [illegible] forms also become, the greater the proportion of water they relatively contain. That may be so to some extent with onions, but no doubt recent [illegible] has led to the production in these large bulbs of greater solidity than formerly was found. That is no doubt to some extent due to the planting for seed [illegible] the hardiest and, of course, the best keeping bulbs.—A D.

FERN HUNTING IN SCOTLAND.

A RECENT spell of fern hunting in the Highlands and elsewhere in Scotland, and its results, merits, I venture to think, a brief descriptive article. Making Aberfeldy my first stopping place, I found, as I had previously done, that I was in the centre of a grand hunting district, though the range of species was more limited than in our south-western counties of England, the Hartstongue and Polystichum angulare being nonexistent, or, at any rate, so rare as to be undiscoverable, which is probably a safer conclusion to arrive at. Lastreas filix-mas, pseudo-mas, montana, and dilatata were in profusion; Athyrium filix fœmina held her own amongst the male ferns as doughtily as any new woman among mankind. Polypodiums, vulgare, dryopteris, and phegopteris, were also well to the fore, Cystopteris fragilis peeped out from many a stone dyke or rocky crevice. Asplenium trichomanes and A. adiantum nigrum occasionally were plentiful, and A. viride lurked in damp nooks in the rocky walls of out-of-the-way glens, as well as high up on the hills in the open. Polystichum aculeatum was not plentiful, but cropped up unexpectedly as fine solitary specimens here and there, and in some of the glens made a fair show, hanging down from crevices in the precipitous rock walls, with great bunches of old and dead fronds pendulous beneath them. P. lonchitis, the holly fern, is rarely obtained *in situ* without a climb of between two thousand and three thousand feet, but I was conducted by a friend, under a vow of discretion, to a populous habitat of this fine fern, situated certainly below one thousand four hundred feet above sea level, and growing there in profusion, and to the full size of eighteen inches or more in height, its bright green fronds sticking up boldly through the heather, so that at a distance I took them for robust fertile fronds of Blechnum spicant, which, by the way, is also one of the plentiful ferns of the district.

Hunting, of course, for varieties, I came across a curiously-partial congested form, all the fronds having most of the pinnæ pinched as it were together. By the roadside, close to this habitat, Botrychium lunaria, or the moonwort, was found as tiny plants, under an inch high, growing in dry soil among short grass, where my conductor informed me he had known it to exist for thirty years. On my return from this trip a visitor showed me a plant he had just gathered close to the Tay Bridge at Aberfeldy, but on searching for another I failed to hit upon one, and got instead a remarkably pretty plant of one of the plantain weeds, each leaf margined with pure white. As the trip to the aforesaid holly domain involved some miles of road, fringed more or less all the way with ferns, I need hardly say that a four-mile speed was not maintained, especially since no less than three promising finds rewarded my investigations, viz., a congested form of Lastrea montana, a variegated form of L. pseudo-mas, and a crispate specimen of the same species; both these last in the same stone dyke. The day previous, wandering by the Moness water, I found, and took home in my handkerchief, a remarkably fine specimen of the Prickly Shield fern, the fine points of which were much appreciated when I handed the bundle over for inspection, and a hedgehog rolled out upon the carpet, after being dropped like a hot potato on account of the points in question. L. montana truncata, with its square and thorny tips, fell twice to my lot at Aberfeldy, and twice again at Strathblane, my next stopping place. A very large plant of this variety I installed in my host's garden at Aberfeldy, and named it Auld Hornie, as a fitting and descriptive local cognomen. On the Kenmore road I found L. filix-mas. mediodeficiens, a form with all the central pinnæ reduced to knobs. Considering, however, that I assiduously hunted for more than a week I came again to the conclusion, as I had done on previous occasions, that the ferns are not very sportive in the district, my "bag" being confined to the finds already cited. At Strathblane, where in previous years Athyrium filix-fœmina revolvens, deltrideum, and medio-deficiens had fallen to my lot, I was more fortunate, two very handsome forms of Lastrea filix-mas rewarding my search, one extremely folious and perfectly barren, and the other with lanceolate pinnæ. These, a ramose and a serrate Blechnum, a very folious Lastrea montana, and a curious form of the same species, with some fronds splashed with yellow, and other fronds entirely lemon-coloured, constituted no bad reward for my pains.

While staying here I profited by my nearness to the spot where that wonderful lady fern A. f.-f. Victoriæ was found to drive over to view it, and after seeing two grand specimens of the original find at Buchanan Castle, Mr. Crosbie, gardener to the Duke of Montrose, accompanied us to the spot. Fortune favoured me, for though thirty-five years have elapsed since the discovery, Mr. Buchanan, a farmer residing close by, who was present when it was dug up, was still to the fore, and joining our party, led us to the identical place. It originated on a grassy bank by the road side, and when found was a fair sized specimen with several crowns. Mr. Cosh, a student from Edinburgh, was getting over the stone dyke, when he suddenly found the fern at his feet. He then went to Mr. Buchanan, who was cutting the grass in the vicinity, and asked him to take care and not cut down the fern, and, contrary to tradition, which states that it remained there two years before it was removed, only a day or two elapsed, its rarity being fully appreciated at the outset. One division went to the Bridge of Allan, and another to Buchanan Castle. Some enterprising nurseryman expressed in the autumn a strong wish to have an "impression" of a frond of so unique a plant, and sent some gummed paper for the purpose, and his wish being unsuspectingly gratified, the adherent spores were not long in forming a marketable stock. This is the history I obtained direct from headquarters, and on the very spot itself, and is, I think, sufficiently circumstantial to merit chronicling.

I may add that at present there is no lady fern near the site of the find; a clump of L. pseudo-mas fringes the dyke foot, and on the other side of the dyke the ferns of the district are fairly plentiful. If variety be induced by environment, there must have been something peculiarly subtle here to lead to such a sport, for, as is obvious, no specially peculiar conditions are visible at all to the eye.

CHAS. T. DRUERY, F.L.S., V.M.H.

CHRYSANTHEMUMS.

VARIOUS HINTS AND OBSERVATIONS.

If I were asked to which class of devotees of the "golden flower" belongs the greatest credit for their productions, I should unhesitatingly reply, the amateurs. Because, amongst this section of growers, one meets with men who have every unfavourable circumstance to overcome, and who are at all possible inconvenience in the cultivation of their plants, and yet, in spite of these drawbacks, the keenest enthusiasm and great thoroughness in details of cultivation appear. The true nature of Englishmen is seen in this persistence in the face of difficulties, and the ultimate success which attends such application is productive of so much the greater satisfaction. One is proud to have made friends amongst such men, and the "same touch of nature" which gives gardeners such an easy introduction to each other is invariably productive of mutual good. The many enquiries and siftings as to the causes of this or that failure or peculiarity, and frequent comparing of notes, is certain to give a stimulus to gardening by making the methods of cultivation more intelligible and simple. Chrysanthemums have done a great deal through the enthusiasm created by their beautiful blossoms to stimulate a general love of flowers, and the energy and devotion which is now applied to this recreation for spare hours by business men will do something towards the fulfilment of Dean Hole's lately expressed wish for "more beautiful gardens."

The month of August should find pots well filled with roots and top growth rapidly progressing. Following previous advice with regard to feeding, we may now give the plants a top-dressing of rich compost to encourage further root action on the surface, and so strengthen and assist the building up of the buds, which are now appearing in various stages. A soil mixed as for potting, but with the addition of about one-twentieth part of the bulk of one of the several excellent artificial manures is very suitable. It may be applied after the surface has been just lightly stirred over, and be pressed on firmly with the hands. Sufficient space must be allowed to ensure a proper quantity of water being given; that is, not less than one inch clear below the rim of the pot. If this is disregarded, and the pots are overfilled, the consequence will probably be that the lower roots will suffer from an insufficient supply of moisture, especially so if the pots do not stand level. In about ten days roots will be freely running through the new soil, and during this time no liquid manure will be required, and all water should be given through a fine rose to prevent washing away the surface before it becomes consolidated. The removal of suckers from the base and all lateral shoots as they appear on the stems will need attention; the prompt pinching away of these all tends to promote a more satisfactory development of the main stems.

The "taking" of flower buds will prove the most interesting occupation during the remainder of this month. It is too late now to allow growth to go on again from any bud showing in the points, but notes taken carefully of the dates at which these buds appear, and supplemented later on with their successful development or otherwise, will prove most useful data for future seasons in the management of the plants. Very forward buds may be retarded a few days by leaving the surrounding young shoots until they are two inches long. If one or two of these growths are left some few inches below the bud they serve as a kind of safety valve for the energies of the plant, and thus prevent, to a certain extent, the early buds from being forced into a coarse, abnormal size, from which good blooms rarely result. It is the too early taking of buds on Madame Carnot which has frequently led to disappointment. August 20 is quite early enough for this, and from thence onward to the end of the month is the best time. Those who have been anxious about the leaves of this variety turning yellow below the "break" shoots will, ere now, have found that the trouble soon ends. I have not met with a grower whose plants have entirely escaped this peculiarity, hence there is some consolation in the fact that we are all "in the same boat." Later growth has never suffered with us, and blooms of first-rate merit are produced on plants which have lost foliage in the early part of summer through this weakness.

Buds of incurved varieties are equally troublesome, if not more so, to secure just at the proper time. Many of the old sorts, such as Queen of England and its sports; Princess Teck with its several offsprings; Lord Wolesley, Prince Alfred, and others, must be timed for the last week of the month. Others of the newer introductions require to be taken by the middle of August, as also do those of sports from Princess of Wales. Many of those introduced during the past few years have much of the Japanese habit of growth about them, and if allowed to go on to a late bud are likely to come very thin and small; Mrs. R. C. Kingston, Duchess of Fife, and J. Agate are instances. The pink sport from Madame Carnot has a slightly different habit in growth from its parent, but is very free, and has exhibited no tendency to disease so far. It is much to be hoped this may prove as fine in form as its parent, and Mr. Jones is assured of its distinctness of colour. The stock is in the hands of this well-known grower, who is giving it a good trial, and will, doubtless, prove its merits by November, and be enabled to give growers an opportunity to judge for themselves.

Amongst the season's novelties are several of exceptionally sturdy and dwarf habit. Chatsworth, Surpasse Admiral, Belle of Castlewood, Georgina Pitcher, Madame Ferlat, and Souvenir de Madame E. Rosette are very noteworthy. The excellent Mary Molyneux is quite a tall grower, but this will not prevent its being largely grown, so good are the blossoms.

Earwigs are becoming troublesome, and the caution to destroy these pests is only necessary to new cultivators. Where bamboo stakes are used the tops should either be cut off at a joint, or the end filled with putty, otherwise, if a hollow space is left it forms a hiding place for the insects. Occasionally green caterpillars and a pale green fly, rather larger than a full grown aphis, will be found; the latter is very mischievous in its attacks on the tender growths, and must be caught by hand. Mildew will doubtless make its appearance during this month on the under sides of the foliage of certain varieties. Those with heavy, drooping leaves are most susceptible, and should be examined frequently, so that the least attack may be checked by dusting on flowers of sulphur. This is a certain remedy, and may also be dusted amongst the plants lightly, as a preventive. Those sorts which make extra large leaves may have a very few removed from the parts of the stem most crowded, this will admit of better maturity of the stem, and help ward off attacks of mildew.

Trent Park Gardens. W. H. Lees.

STRAWBERRIES AT MAIDSTONE.

Through the kindness of Mr. George Bunyard, I have recently had the great pleasure of inspecting and comparing the firm's very large collection of strawberries, comprising several acres in splendid condition and culture. We all know this firm to be second to none as regards fruit tree culture, but perhaps it is not generally known that Mr. Bunyard has one or two hundred acres of land on the opposite side of Maidstone to the fruit-tree nursery, devoted principally to the growth of runner strawberries, an immense quantity of all the best peas for seed (all sticked), beans, and one quarter of sixty thousand Superlative raspberries. Bearing in mind that it is not every gardener, and others interested in strawberries, who can spare the time to make such examination, I have thought that a few notes jotted down at the time might possibly be of service and interest to your numerous readers.

To see the many varieties growing side by side, and note their various characteristics is most interesting. "What a grand grower and cropper that one is," was my first exclamation on entering the grounds. "Yes, that's Royal Sovereign. We have been gathering from these plants for the last fortnight," was the reply, and to judge from the crop of half-ripe and green fruits swelling, it struck me that another fortnight would not exhaust the crop. Of course, I had to taste it, and although not quite equal to such varieties as Dr. Hogg and The Countess, still I have no hesitation in saying that I should consider it the best all round strawberry grown. Thousands of runners of this variety are layered into small pots annually for forcing and general purposes, as customers find that these plants, grown at such a high elevation, and open to all points of the compass, are so sturdy, and thus better able to stand the rigours of a severe winter. La Grosse Sucree was good; this, from my own personal experience, I find one of the best for forcing, but Edward Lefort struck me as being an improvement upon it. This latter has received a first-class certificate R.H.S. Latest of All is a misnomer as regards name; this was raised from British Queen—large, fine appearance, good flavour. To prolong the season this should be tried under a north wall; a very desirable sort.

Waterloo is one of the best late sorts; large and good; a most useful and desirable kind, planted on an east border; we have some grand fruit left. Its colour, I hear, is against it for market purposes, as it gives one the idea when gathered as being stale, but when it is well known I think it will be in great demand. Wonderful.—Enormous cropper, excellent flavour, very much like Vicomtesse H. de Thury, but struck me as being paller. Trollope's Victoria.—Mr. Bunyard recommends to be planted where others do not succeed, such as in or near towns; it is a good grower and cropper. Louis Gauthier is an enormous cropper, blush or pale pink, of excellent flavour, and makes a very pretty dish. Leader was carrying a good crop, and does better than most varieties in dry weather; I cannot say much for its flavour. Monarch was grand, very large, good appearance, and are worth growing, although the flavour is only second-rate.

Wallruff is new, an enormous cropper, and of excellent flavour. La France bears a good crop, is very handsome, bright, and one of the best. Stephens' Wonder is very poor, both in appearance and flavour. King of the Earlies is very juicy, and of excellent flavour, one well worth cultivating. Sensation is properly named when one sees the crop it carries; good appearance, but poor flavour. Countess and Dr. Hogg were in grand condition, the flavour of both being superb; the former should be planted one foot apart in the rows and eighteen inches between the rows; these two were the very best flavoured sorts that I tasted. Auguste Boisselot is of good flavour and an enormous bearer; on one plant I counted twenty-five trusses of fruit; runners difficult to obtain. Saint Joseph is a perpetual alpine, perhaps the best of its class.

Of course, a great many other sorts are grown, but those names struck me as being amongst the best, and certainly a trial should be given them. Thirty to forty thousand thumb pots are used annually for layering. A thorough examination takes place several times during the fruiting seasons, and all rogues and weakly plants are destroyed; thus the stock is kept vigorous and true to name. This process of selection is an important point with the firm. Our examination had taken us near upon two hours, and altogether I had tasted something like one hundred varieties, when at last my guide invited me to tea, which, unfortunately, I was unable to do justice to.

Badham Court Gardens, Maidstone. G. W[illegible]

English Gardens.—It is stated by Fitzstephen that in the time of Henry II. the citizens of London had large and beautiful gardens attached to their [illegible]. In the reign of Edward I. it may be collected from Hollinshed's "Chronicle" that the cultivation of the garden was extended to the more curious and [illegible] productions; but the wars of York and Lancaster destroyed all these [illegible] and gardens in general ceased to be more than pleasure-grounds or [illegible] gardens of the rudest kind until the time of Queen Elizabeth. King James I. of Scotland describes the garden at Windsor Castle, where he was [illegible] Henry V., as a place set thick with trees and alleys of hawthorn, [illegible] in each corner. Much later, in the year 1512, the great Earl of Northumberland, whose household consisted of 160 persons, "had but one gardener, who [illegible] hourly in the garden for setting of erbis, and clipping of knottes, and [illegible] the said garden clean." In the gardens of Nonsuch, the palace of Henry VIII., constructed about the year 1540, we hear of shady walks, columns and [illegible] of marble, "fountains that spout water one round the other like a [illegible] which are perched small birds that stream water out of their bills," and [illegible] objects, but nothing of the more essential part of a garden—its plants. [illegible] grounds of this description, indeed, have existed in England ever [illegible] Conquest.

VEGETABLES FOR EXHIBITION.

THE TOMATO.

It seems but a few years that the tomato (*Lycopersicum esculentum*) was scarcely known or grown in this country except by the wealthy and owners of large gardens, and then only to very limited extent, being grown on a south wall in the open. But now what a change; hundreds of acres of glass are devoted to their culture at home and hundreds of tons are imported annually to supply the ever-increasing demand. The difference between a well-grown and nicely-ripened tomato and a poor one is most apparent, and to have fruits in perfection they should be ripened on the plant and under glass. The hybridizers have kept pace with the times, and no doubt the introduction of so many first-class varieties has had much to popularise tomatos. Where plenty of glass is at command and good varieties are selected, there is no reason why fresh tomatos should not be had every day in the year.

I will first treat upon cultivation under glass. The first sowing should be made the first week in January in a light sandy compost in heat, and as soon as the young seedlings appear above the soil place them on a shelf quite near the glass, and just before they come into the rough leaf pot off singly into thumb-pots, using three parts leaf soil, one part loam, and a fair amount of coarse silver sand, which should be warmed to the same temperature as the house in which the seedlings are growing. The soil should be pressed moderately firm about them, and right up to the seed leaf. Water in with warm water, as no check must be given them at this season of the year, and excess of moisture both at the roots and overhead must be avoided. The next shift should be into large sixty pots, and as soon as sufficient roots are made pot again into thirty-two's, after which they should be transferred to the fruiting pots, which should be eight or ten-inch size. The aim all along should be to encourage a strong, sturdy growth, and though some plant them out, I much prefer pot culture, especially for winter and early supplies. The plants may be grown tied to stout stakes in an upright position or trained to a trellis near the glass always affording them as much light as possible. The single stem system I have found to answer best, removing all lateral growth as fast as it appears. The soil for the final potting should be three parts good fibrous loam and one part well decayed leaf soil, with some coarse sand added. The pots should be well drained, and it will be well to examine the early flowers daily, and with a camel's hair brush dust the flowers to ensure a free set, or, failing this, smartly tap the stems in the middle of the day. A stagnant atmosphere should always be guarded against, or the dreaded fungus on the leaf will be almost certain to make its appearance, but I have never found it to make any serious headway when a dry buoyant atmosphere is maintained. Manure should not be applied in any form till the plants are well set with fruit, after which it may be given freely every other watering. I prefer the drainings from the farmyard, properly diluted, to all other aids. Towards the end of April, if the plants have been properly cared for, ripe fruit may be expected. During summer and early autumn nearly any kind of house, pit, or even cold frame will produce excellent results. I have seen splendid exhibition fruit grown and ripened in a cold frame by simply digging out the ground to the required depth, and placing the pots in the front, running up the growth on rods a suitable distance from the glass. The lights should be pulled off on bright, warm days, and replaced on cold nights and wet weather. The same applies to heated brick pits, and we generally grow our autumn supplies in this way. To keep up a constant supply, a small pinch of seed should be sown once a month during spring and summer.

From December to April will be found the most difficult months for producing good ripe fruit, and unless one has means at command it is be better not to make the attempt. Well-heated, light, lean-to houses are best adapted for this purpose, and the seed should be sown early in August, and again in September, as it is absolutely necessary that the plants should be in a strong, healthy condition before placing them in their final quarters for the winter. Eight-inch pots, well drained, should be used for this purpose, and all surplus growth kept cut away. The flowers should be fertilised in the morning each day, and a fairly dry atmosphere should be maintained, admitting a little air whenever the weather will allow. The most suitable temperature for winter tomatos is [illegible] degrees as a minimum, and 65 degrees as a maximum. The fruit should always be cut immediately it is coloured, and if kept in a dry, warm room will keep well for weeks.

Except in a few favoured parts of this country, I do not advise outside cultivation to any large extent, as it is a very precarious crop, and only in hot, dry summers can it be made to pay. Besides, it is absolutely necessary, as far as my experience goes, to sow early, and bring the plants forward under glass before planting. The seed ought not to be sown later than the first week in March, and every encouragement afforded the plants by repotting when necessary, giving them a light, airy position under glass, so that they are in a stout, well-hardened condition when planted, which should be done the last week in May or the first week in June. The larger the plants the better, providing they have been properly treated. Carefully harden before planting, and, should the weather be cold and unfavourable, some protection should be given for a short time. It is useless to attempt outside cultivation unless a suitable site can be given, and without question the best position is a south wall or building. This being secured, in favourable seasons good tomatos may be obtained. Plant at a distance of about twenty inches apart, and have but one stem, removing all surplus growth as fast as it makes its appearance. In dull cold weather the plants may be partly denuded of their foliage, exposing the fruits as much as possible. After a good set of fruit is assured a thorough mulching of half-decayed horse manure should be given, and the roots kept well supplied with water. In hot, dry weather syringe the plants in the early afternoon with tepid water. Failing a south wall, the plants may be grown on a sheltered south border, or a light open sunny position, and trained upright to stout stakes, but a good distance must be allowed between the plants. Four feet from plant to plant, and five feet between the rows, should always be given. As soon as the fruit is partially coloured it may be picked and finished off under glass, and the little extra warmth will improve the flavour considerably. On the first signs of frost in the autumn all the green fruit should be gathered in and hung up in bunches to ripen in a fairly warm temperature. They will be useful for cooking purposes, will make excellent sauce, and may be kept some time for this purpose. In cold, wet, sunless seasons the outside crop is invariably attacked by the tomato disease, which often completely ruins the entire crop. I know of no remedy except to take off and burn the affected leaves as fast as the disease makes its appearance. Under glass, however, it can be dealt with, and stamped out by raising the temperature with fire-heat and keeping a dryer atmosphere. The same applies to the black spot often seen in the green fruit, but I have found but little difficulty in stamping this out by the removal of the affected fruit. A small white fly, which increases at a great rate unless checked in the early stages, often gives much trouble under glass, but persistent fumigating every night and morning for three or four days should free the plants of these. One or two applications is of no avail, as they simply fall down stupefied and make their reappearance in a day or two.

Tomatos are indispensable to vegetable exhibitors at all seasons of the year, as they form one of the most pleasing and important dishes in a collection of vegetables of any number, and if presented in good condition are bound to arrest the attention of the judges. One of the most important points to study is the selection of varieties, as it is useless to exhibit the older varieties, especially in close competion. The selection of the fruit should be made directly after they are set, leaving not more than two on a bunch, and the plants ought not to be over taxed, especially when the roots are confined in pots or boxes. Occasional doses of artificial manure should be applied, a dessert spoonful will be ample to an eight-inch pot; use also liquid manure frequently, and do not allow the plants to suffer from dryness at the roots. The fruits should be carefully cut and laid on some soft material in a dry, warm room after they are well coloured, or many will probably crack. They will keep for some days in good condition, and enable the remainder to be finished off properly on the plants. I consider that tomatos for exhibition can hardly be too large, providing, of course, they are perfect in other ways. The chief points to be aimed at are size, freshness, shape, colour, smoothness of skin, small eye, and evenness of fruit throughout; the fruits look best arranged on clean white cotton wool.

There are now numberless varieties for exhibition, but the Perfection type cannot be beaten. Among the very best selections that have come under my notice are Cutbush's Polegate, hard to surpass when at its best; Carter's Duke of York, a fine coloured variety; Sutton's Best of All, of perfect shape; and Webb's Sensation, also excellent. The above are all red skinned and large varieties. Two very fine yellow kinds for show purposes are Veitches' Golden Jubilee and Sutton's Golden Perfection, but preference ought always to be given to the red skinned kinds. Some of the small and medium fruiting kinds of both colours are of delicious flavour, and in showing a collection of tomatos and ornamental displays of vegetables some of them ought to be included; these should be put up in bunches, if possible. Sutton's Dessert, Sutton's Miniature Pear-shaped, Sutton's A 1 and Peachblow in reds; and Carter's Greengage, Sutton's Golden Nugget, Sutton's Sunbeam, and Sutton's Prince of Wales among other colours. For market and general use Hackwood Park Prolific and Chemin Rouge are among the best. For winter use Earliest of All is a great favourite, though not so pleasing in shape as many others. It is of good colour, fine flavour, and sets most freely. For outside cultivation I can very strongly recommend Carter's Outdoor; it is most distinct from any other variety I am acquainted with, and the quickest to ripen. This should become a general favourite for outdoor cultivation.

Aldenham House Gardens. E. Beckett.

Fertilisation of the Foxglove.—It must never be supposed, writes Sir Edwin Arnold in the *Daily Telegraph*, that the spring-time plunderer of rose bushes is called "humble bee" by naturalists or by other bees in any deprecating or stuck up sense. Beyond doubt "bumble" or "humming" bee is the proper name, and the handsome insect which wears it is really far more useful to the world of flowers than hive bees, or perhaps any other of its kind. Certain sorts of clover and the familiar scarlet-runner, as well as the foxglove, and other plants can only be fertilised by visits of the humble bees. There are many of that species in Nicaragua, but for want of the proper bee Belt tells us that the phaseolus, the French bean, has never produced a single pod in that country. In the same way the vanilla plant, introduced into India from tropical America, grows well, and flowers there, indeed, but has never once fruited for want of its own proper insect. The accomplished and charming naturalist just mentioned had the honour to assist Darwin himself in understanding how the humble bee is indispensable to the foxglove (Digitalis purpurea). He says: "The racemes of purple bells held up by the foxglove are methodically visited by it, commencing at the bottom flower, and ascending step by step to the highest. The four stamens and the pistil of the foxglove are laid closely against the upper side of the flower. First a stamen on one side opens its anthers and exposes its pollen. The humble bee, as it bustles in and out, brushes this off. Then another stamen exposes its pollen on the other side; then another and another; but not till all the pollen has been brushed off does the cleft end of the pistil open and expose its viscid stigma. The humble bee brushes off the pollen on to its hairy coat from the upper flowers of one raceme, and carries it direct to the lowest flowers of another, where the viscid stigmas are open and ready to receive it. If the humble bee went first to the upper flowers of the spike, and proceeded downwards, the whole of the economy of this plant to procure cross-fertilisation would be upset. The open flower of the foxglove hangs downwards. The lower part, or dilated opening of the tube, is turned outwards, and has scattered stiff hairs distributed over its inner surface; above these the inside of the flower hangs almost perpendicularly, and is smooth and pearly. The large humble bee bustles in with the greatest ease, and uses these hairs as footholds whilst he is sucking the honey; but the smaller honey bees (who would be unserviceable) are impeded by them, and when, having at last struggled through them, they reach the pearly, slippery precipice above, they are completely baffled." So intimately is the floral world linked with that of the insects.

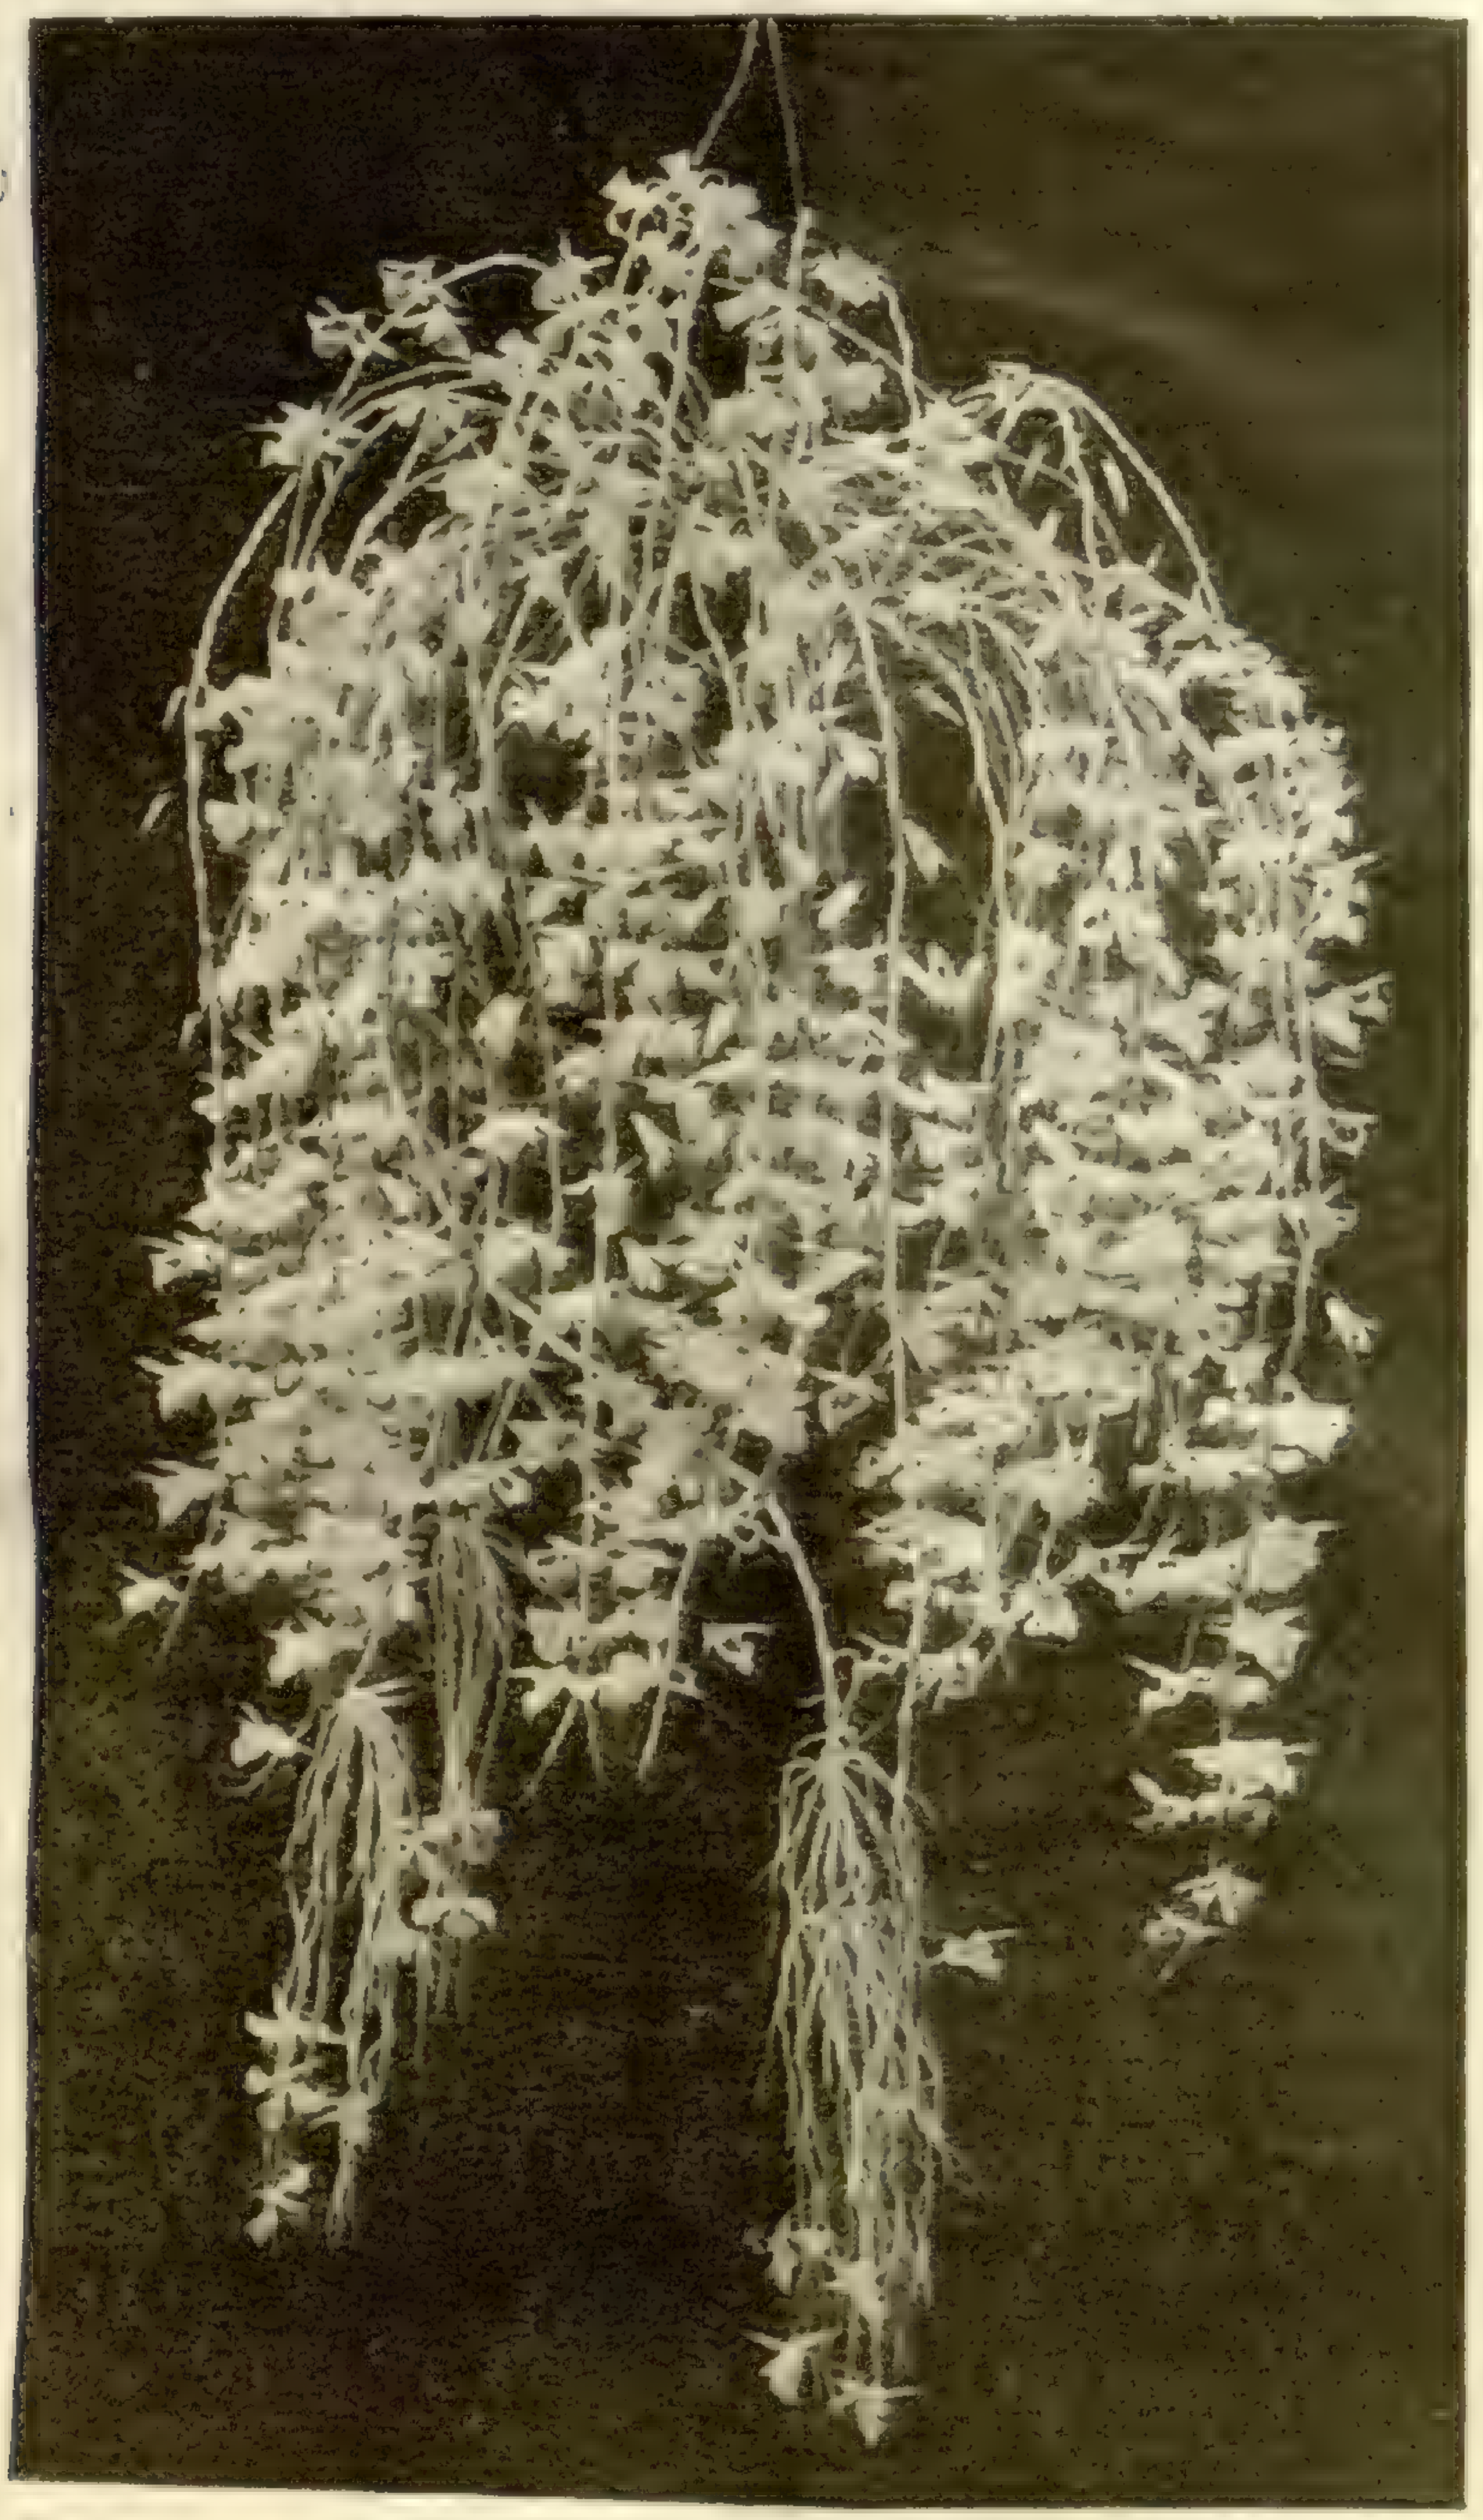
NOTES ON ORCHIDS.

ORCHID SEEDLINGS.

SEEDLING cypripediums that were repotted in spring will again require attention in the same direction, for much heat and moisture has caused the small amount of compost in the tiny pots to perish, so that fresh compost is very important; allow plenty of fresh green sphagnum, broken crocks, and charcoal. The seedlings require every care and attention, especially frequent pottings when in a growing state. The same may be said of cattleya seedlings. Dendrobium seedlings must not be interfered with unless the first small bulb is made, then they can be repotted into larger pots. All seedlings ought to be kept growing at a good pace, otherwise the rate of progression is exceptionally slow. A watchful eye must be kept for pests. Cattleya seedlings, growing on surface soil in the pots where they were sown, are now forming small leaves, and will require close watching as regards watering; keep them in a moderately moist state. These must be well shaded, otherwise the sun will destroy them and dry up the moisture they require.—T. STAFFORD, *Tyntesfield Gardens.*

DENDROBIUM PIERARDI.

This is a most interesting and beautiful dendrobium, its great interest being in its being probably the first species of a now well-known genus of orchids to be introduced to cultivation in Europe. It flowered at Liverpool in 1821, and was probably in cultivation at Kew even earlier than that. The species has a wide distribution, and is common throughout North-East India and southwards to British Burmah. It is a plant that is found at home in the mangrove swamps, and, according to Sir Joseph Hooker, it clothes the fallen trees in the hot moist valleys of the lower Sikkim Himalayas. With such a wide distribution, it is only natural that the species should vary somewhat, and such variation is seen mostly in the shape of the petals. Almost everyone is acquainted with this popular orchid, and recognises its long pendulous growths, clothed two-thirds of their lengths with pale rosy-mauve flowers, borne in pairs, and each having pale primrose lip, streaked at the base with purple. Although not a difficult orchid to manage, it is seldom that such a fine specimen of D. Pierardi is seen as that figured in the present issue, and grown from a tiny plant by Mr. M. E. Mills, gardener to Frank Lloyd, Esq., Coombe House, Croydon. When photographed the plant carried over seven hundred flowers on growths varying from two to four feet in length. It is a very fine variety, both in colour and shape.—C. C.



DENDROBIUM PIERARDI AT COOMBE HOUSE, CROYDON.

ODONTOGLOSSUM CRISPUM LEEMANNI.

This is one of the many handsome spotted varieties of O. crispum that have flowered with Messrs. L. Linden and Co., at Moortebeek, Brussels, of late. It has large flowers with broad segments, white, with a faint suffusion of rose here and there, and with a few very large and irregular blood-red spots on sepals, petals, and lip. The lip has a large yellow disk lightly marked with bright crimson. The variety is dedicated to Mr. J. Leemann, an enthusiastic amateur residing in the Manchester district. *Lindenia* t. 609.

LÆLIO-CATTLEYA HRUBYANA.

A handsome hybrid that will have to take its place as one of the beautiful and varied forms of Lælio-cattleya elegans. It has fine, large flowers with sepals and petals of a bright rose-purple colour. The large and broad lip is intense purple, very handsome and effective; throat yellowish, side lobes purple. *Lindenia* 610.

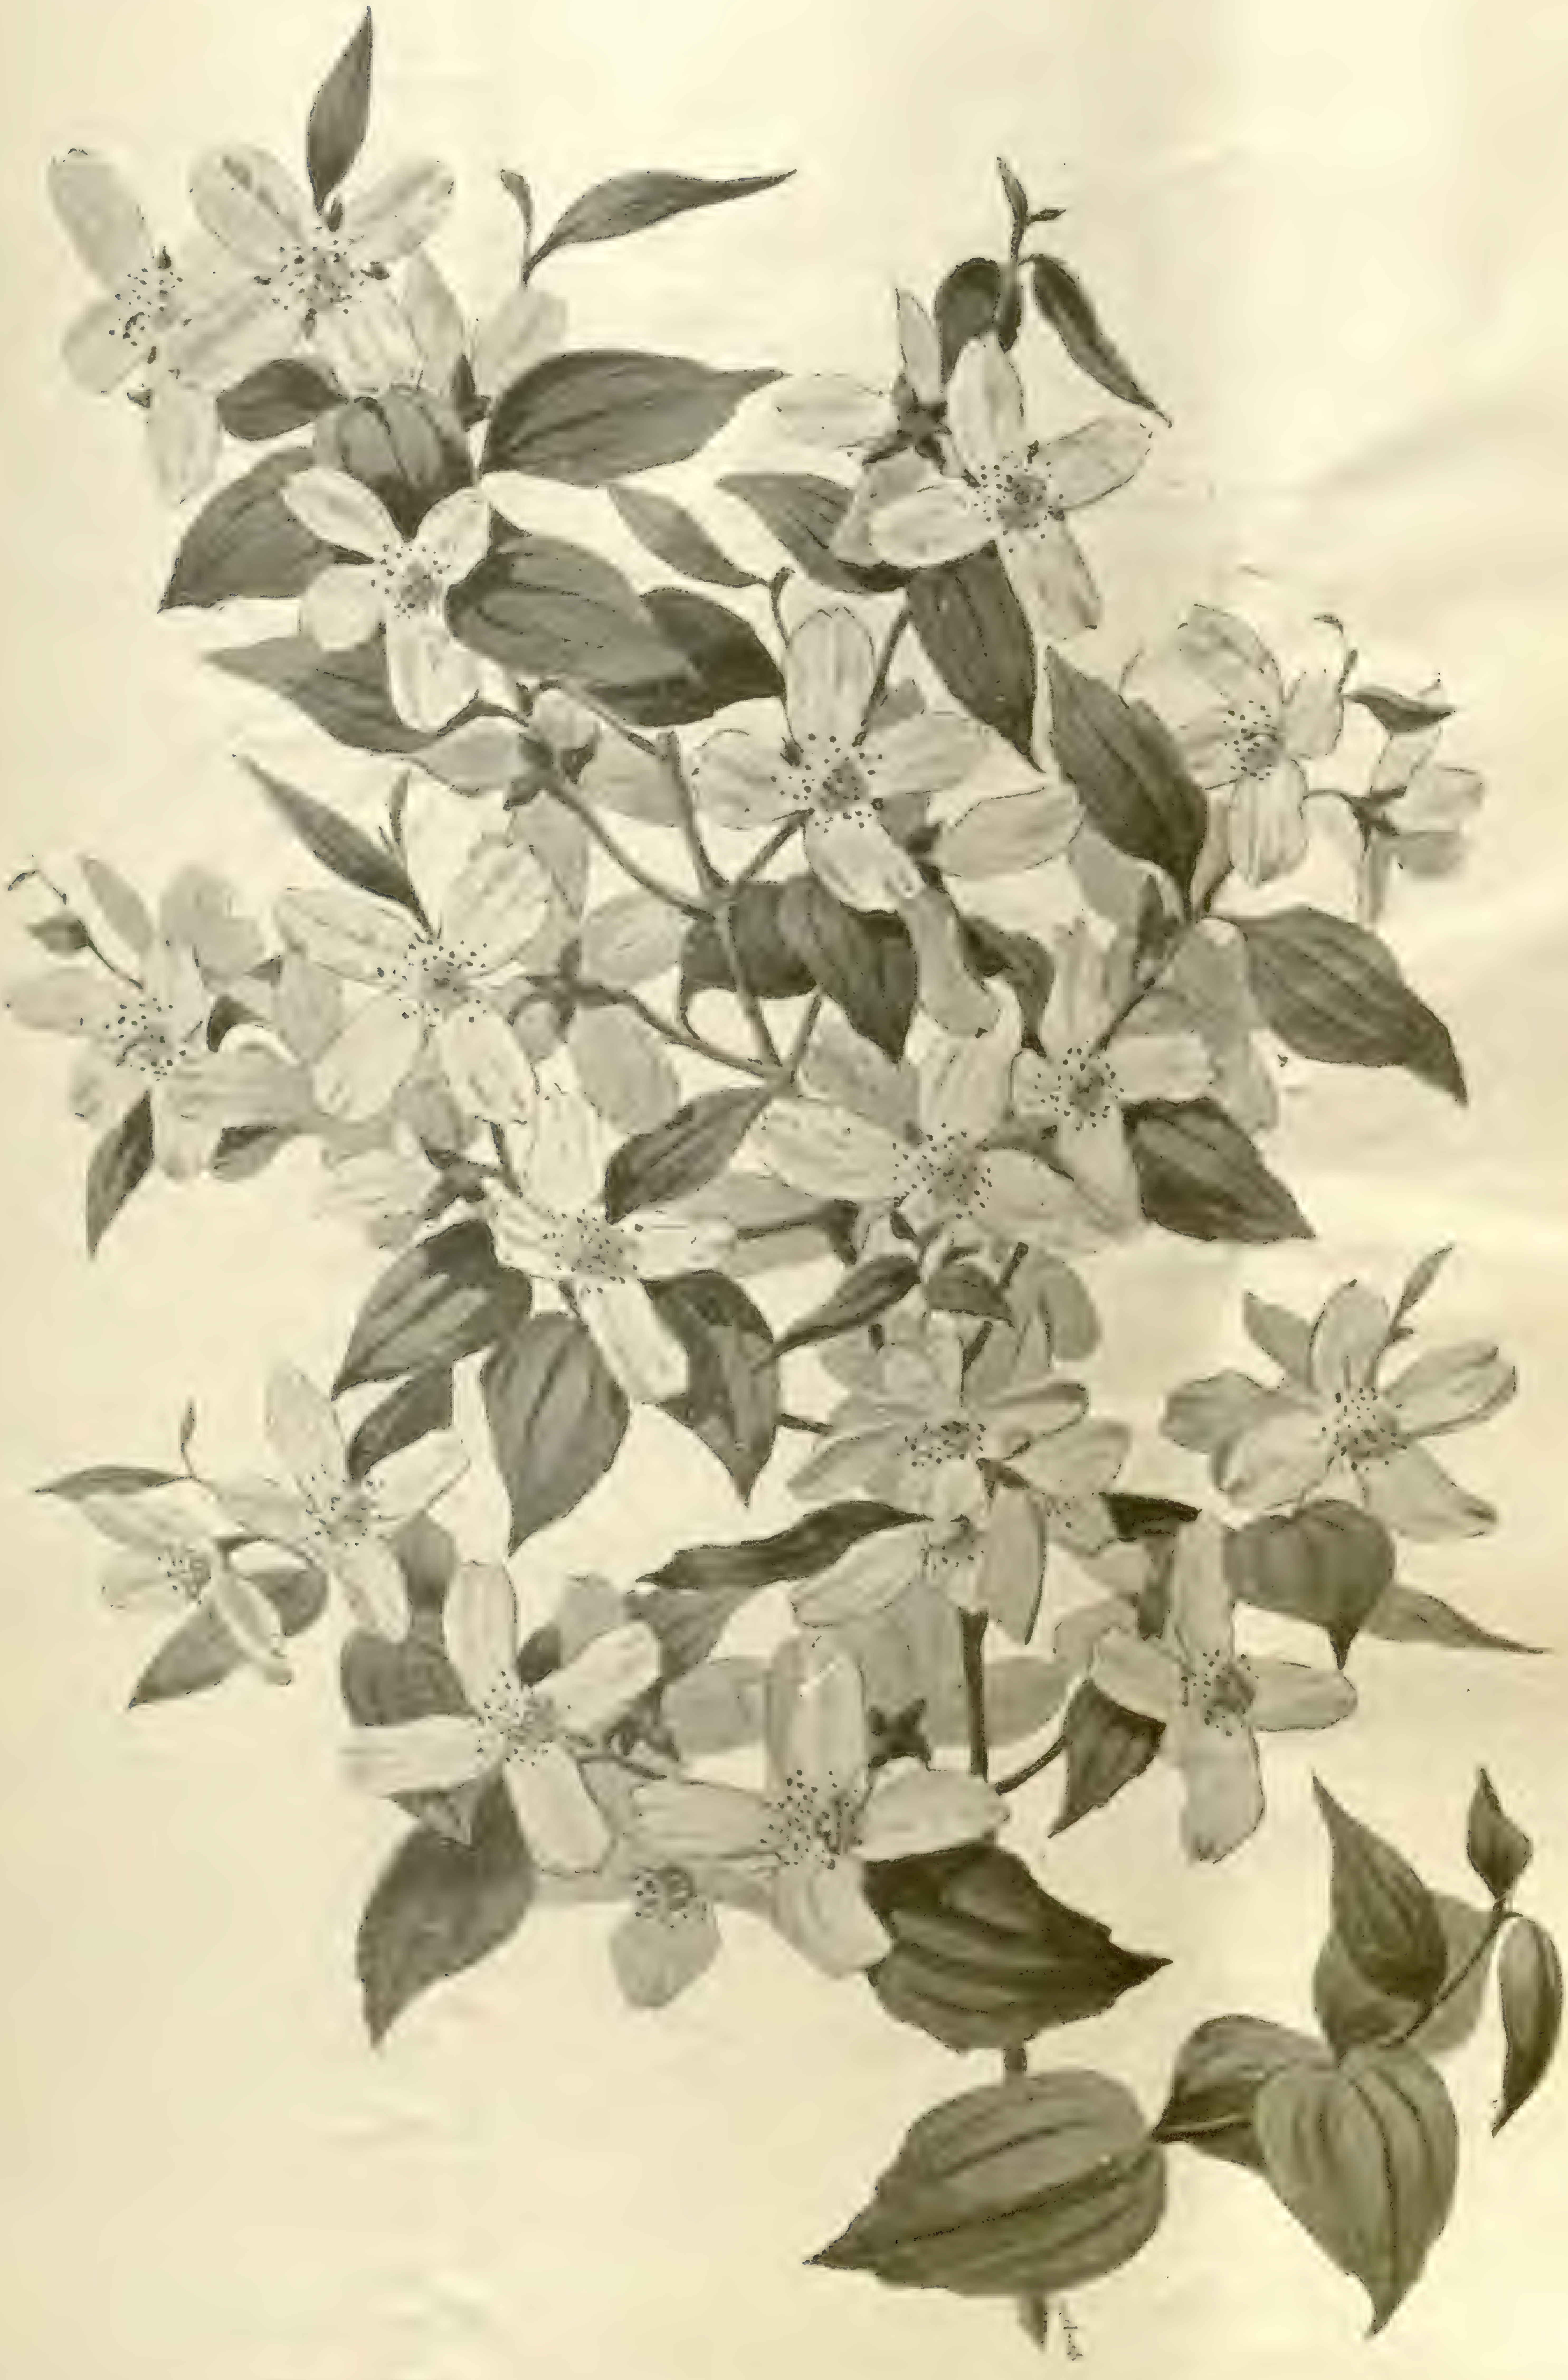
NEW PHILADELPHUS.

UNTIL the introduction of the comparatively small growing and exceedingly elegant Philadelphus microphyllus from Mexico in 1883, the potentialities of the mock oranges do not appear to have been recognised by the hybridist, and the only garden forms in cultivation were varieties that evidently originated as chance seedlings or sports. Nor is this surprising, for prior to the year 1883 the species and varieties in cultivation differed so little in their principal characteristics as to afford but little scope for the creation of distinct forms. With the introduction of the small-leaved mock orange the hybridist had at his command a quite new type, and Mons. Lemoine, who has done so much to enrich our garden flora, was not slow to take advantage of the opportunity thus afforded for the display of his ripe judgment and rare skill. He almost immediately commenced the hybridisation of the Mexican species with one of the finest garden forms of P. coronarius, and the result was the beautiful hybrid P. Lemoinei, in which the characteristics of the two types are admirably blended. In this form we have the elegant habit, the star-like flowers, and the floral profusion of P. microphyllus, with a more robust habit and larger leaves, and flowers indicating the influence of the stronger growing P. coronarius. This fine hybrid quickly obtained recognition from those who appreciate hardy shrubs with beautiful flowers, and it has been largely planted in British gardens. More recently an erect growing form has been introduced under the name of P. Lemoinei erectus, and this is so free in blooming as to justify the anticipation that it will become immensely popular both for the shrubbery border, and the conservatory, its neat habit rendering it of much value for pot culture. This was well shown by Messrs. Barr and Sons at the first of the two meetings held by the Royal Horticultural Society in July last.

Having obtained such an excellent result from the first cross M. Lemoine proceeded to intercross P. Lemoinei with various forms of P. coronarius, and achieved a degree of success not less gratifying. By the fertilisation of the former with the pollen of the latter, M. Lemoine obtained, among others, Gerbe de Neige and Boule d'Argent, which have single and double flowers respectively, these in each case being pure white, and pleasantly fragrant. Each of these varieties more closely approach in general character the pollen parents than did P. Lemoinei, but the influence of its pollen is seen in the smaller leafage and in the more elegant poising of the flowers on the slender growths. Both were figured in the GARDENERS' MAGAZINE of August 24, 1895, with an accompanying note by Mr. George Nicholson, in which some interesting particulars of their origin are given. Since their introduction to our gardens another surprisingly beautiful hybrid has been presented to public notice under the designation of P. coronarius Mont Blanc, and of this we give a characteristic full page illustration herewith. This was raised from P. coronarius fertilised with the pollen of P. Lemoinei or one of its descendants; and there can be no doubt as to its being one of the most valuable of the several garden forms that have originated with Mons. Lemoine. Mont Blanc is wondrously free in blooming, and the flowers are remarkable for their purity, in this respect closely resembling the snow that forms the perpetual covering of the mighty mountain to which it has been dedicated by the raiser.

Our illustration has been prepared from a specimen kindly supplied by Messrs. James Veitch and Sons, of Chelsea, by whom the variety was admirably exhibited at the second of the two meetings held by the Royal Horticultural Society in June last, when it attracted much attention.
G. G.

Insect Enemies.—Greater enemies to man than either birds and mammals are the swarms of insects that, from time to time, commit such havoc upon human food. Perhaps the most historic of these marauders is the locust, a creature that still does its full share of damage. In South Africa the larvæ of the locust pass over portions of the country in a broad torrent. Nothing impedes, observes a writer in the *Standard*, their march, for they will fill up canals and streams, and even the deep trenches that are sometimes dug in their way. A thunderstorm, however, seems to deprive them of their vitality. The vanguard ceases to progress; and those behind come up to it, and are too weak to crawl over their companions, so that at last a continuous bank of the dead grubs, some four feet in height, is formed across the country. America, with its usual ill fortune in such cases, has suffered very severely from insect pests, the Hessian fly and the Colorado beetle being amongst them. The Hessian fly was brought over to the Continent, during the American War of Independence, by some German soldiers of King George. Being cavalry, they carried a freight of forage with them in which larvæ of the fly were present. Ten years after, it was well established, and from then till now has done incalculable harm. The Colorado potato beetle, like the kea, was once an inoffensive creature, feeding upon a plant something like our deadly nightshade, till, in 1859, it acquired the potato habit, and throve upon its new food miraculously. From that year it began a steady march eastwards, going to beyond Omaha, a distance of five hundred miles, in the first twelve months. By 1865 it had crossed the Mississippi River into Illinois; by [illegible] it was in Ohio; in 1871 it reached New York. Considering the number of its enemies the Colorado beetle must have multiplied wonderfully, for it was acceptable food to a bird, several spiders, three wasps, several lady-birds, [illegible] ground-beetles and tiger-beetles, many of the soldier-bugs, a Tachina fly, and [illegible] fly. Another great American pest is the famous gipsy moth, which could, if unmolested, devour the entire vegetation of the United States in less than [illegible] years. This insect, however, is only rampant in the State of Massachusetts, having been "presented," so to speak, by a French naturalist, who was experimenting on silkworms, in 1869. A few specimens escaped from his study, and [illegible] breed; but not for twenty years was it noticed to what an extent. When the [illegible] began to be realised, it covered over two hundred and twenty square miles of country, entirely defoliating the woods that it attacked. It has now been driven back into less than a hundred miles of forest; and, eventually [illegible]. A familiar friend of our own, the white cabbage butterfly, at one time [illegible] in America to an alarming extent, having crossed the St. Lawrence, [illegible] Canada, in 1865; but it either found enemies, or the climate did not suit it, and now gives no serious trouble.



PHILADELPHUS · CORONARIUS MONT BLANC. (Flowers pure white.)

WORK FOR THE WEEK.

WARM ORCHIDS.

IN almost every collection of orchids, whether large or small, the owner and grower continually weed out their inferior varieties and replace them with superior ones; hybrid dendrobiums are prized generally, and so are cattleyas and cypripediums; but calanthes, vandas, phaius, &c., are not generally sought after so much as the three former, although there are gems amongst them. A great many of the hybrids, in my opinion, are a long way behind the parents, for, to obtain a good cross, a great amount of consideration is required. There is no doubt about the work being very fascinating, but the long, anxious waiting is against it. At the present time we find several hybrids in flower, Cattleya calumata and C. c. superba, the result of a cross between C. Acklandiæ and C. amethystoglossa, being certainly a gain on the former parent, having a stronger constitution and an intermediate colour; a good variety of the latter is, however, worth growing. Cattleya Schofieldiana is another of the same section, while C. Forbesi, C. guttata, and C. g. Leopoldiana all come into flower when flowers are scarce, with the exception of a few C. gigas. All the cattleyas in flower at this time of the year are best kept by themselves, for the amount of moisture used in the cattleya houses will cause the blooms to damp and the colour to fade. Miltonia Roezli and M. Roezli alba will be now making new roots. This is a species that requires special attention if repotting is required. This may be done at the present time, and a good plan is to thoroughly wash out all the roots with clean water, thoroughly strip the bulbs of any old leaves, and immerse them, roots and all, in a weak solution of fir tree oil insecticide, washing them in clean water before repotting. This is done in order to eradicate the yellow thrip that they are often infested with. This Miltonia must be grown in a hothouse where it can have plenty of moisture and be syringed often; in fact, a good plan is to keep the syringe close to where the plants are grown, and every time you come near use it. Allow the plants a damp bedding of sphagnum or anything that keeps moist.

Dendrobium formosum will be now throwing up spikes, and the plants must not become dry at the roots; use the syringe when the weather is favourable, and sponge the plants with soft soap water occasionally, as bug often infests the top leaves and gets among the buds. Dendrobium Phalænopsis Schröderianum will also be throwing up its flower spikes, and such must be placed at the warm end of the dendrobium house, and be treated in the same manner as the earlier dendrobiums. D. Falconeri will just about have finished flowering, it is a gem in its class, but a difficult one to grow and flower successfully; plants have been known to grow well and flower abundantly kept altogether in an ordinary plant stove, allowing only a few weeks' rest in the winter months, and in the summer allowing abundance of water, and syringing three or four times a day. Some grow them with other dendrobiums, and allow them a long rest, which is preferable, as they must be allowed to finish their growth, and be gradually brought to rest. Dendrobium Falconeri giganteum, a supposed natural hybrid between D. Wardianum and D. Falconeri, requires plenty of heat while growing, and must be kept clean; in fact, cleanliness is the greater part of the battle in growing orchids successfully. Lælia elegans will be coming into flower in many collections; only just sufficient water must be given to allow for the preservation of the flowers, and in order to keep the bulbs in proper form.

During this month we are often troubled with cold nights, and I noticed a few evenings ago the thermometer registered only six degrees above freezing point, so care must be taken not to do any damping on such nights, though many growers are in the habit of damping as late as nine or ten o'clock. The shading will require to be carefully managed, and so will airing.—T. STAFFORD, *Tyntesfield Gardens.*

STOVE PLANTS.

THE later successional batches of poinsettias should be potted up at once, and encouraged to make a free growth. The earlier batches are looking well, and should be established in their flowering pots; give them all the light possible except during the middle of hot days. Shut them up and afford them a good syringing about a quarter to three, opening the ventilators about an inch at six p.m., and leaving them open all night. When watering be sure the whole ball is wetted through, if the pots are full of roots. Poinsettias will take plenty of water, and they must not be allowed to suffer for the want of it from the time they are established in their flowering pots until their bracts are fully expanded; if the watering is carefully attended to, and the plants do not receive a check from any other cause, they will retain their leaves to the base, and this should be the object of the cultivator, as without plenty of good healthy foliage it is useless to look for large bracts. Young plants of panax in three-inch pots may be potted into five-inch, in which they will make useful specimens for furnishing Cuttings of acalypha may be had in abundance now; propagate these singly in two and a-half and three-inch pots, in which sizes they are useful for table decoration. Put in a few more suckers (small) of pandanus; these will root on a dry shelf; small plants of three to four inches high, in thumb pots, are useful to associate with scarlet and white flowers on a dinner table; also for placing in the miniature vases ladies are so fond of introducing into the boudoir. Pot on cuttings and seedlings of Asparagus tenuissimus, A. Sprengeri, A. plumosus, &c.; five-inch pots are a suitable size for these for decorating. Young stock raised in the spring make useful plants by the autumn. Put in a few pots of cuttings of fittonias and Pilea muscosa for winter use. Young stock of gloxinias established in five-inch pots must receive every encouragement, so that they may make a good display during September. Remove older plants coming into flower to a cooler and drier house. Achimenes as they come into flower remove to the conservatory, removing batches of these and gloxinias as they pass out of flower to a pit where they may receive plenty of sun and air; give water regularly until the foliage is well advanced in ripening. The thorough maturation of the tubers simplifies their successful keeping over winter. Keep a sharp lookout upon reinwardtias, that red spider does not gain a footing, else many of their leaves will fall, and thus detract greatly from their beauty at the flowering season.

Young plants of Rivina humilis that are now flowering should be afforded a position in a moderately warm, airy house to enable them to set a good crop of their lovely coloured berries; well berried plants of this and Callicarpa purpuria associate well for autumn decoration. Ardisias also are useful, but it is seldom one sees them well done. All strong growing plants should be afforded stimulants two or three times a week, in fact, all plants with pots full of roots will be benefited thereby, while in no case affording strong applications, the more robust growing plants will take the stimulant stronger than those of weaker growth. Where plants are growing under climbers, such as Allamanda, it will be necessary to examine them once every day and remove fallen flowers, for if allowed to remain long they are apt to seriously disfigure the foliage of the plants beneath. Eucharis are growing freely and will need feeding, unless for any special purpose I should not recommend removal to other houses to cause them to throw up their flowers later; if mite is present in the soil it will make such headway while the plants are undergoing the enforced rest that they will be some time before they recover. During the prevalence of dull weather do not try to excite the occupants of the stove by excessive heat in the pipes, rather allow the temperature to fall a degree or two and keep the house a little less moist; by treating so the plants will stand the strong sun better when it appears. Also during a long dull period feed the plants less liberally than during brighter weather.—J. TUNNINGTON, *Ripley Castle Gardens.*

THE FLOWER GARDEN.

NOTWITHSTANDING the dry weather which has prevailed since the planting out of dahlias, a free growth has been made where a mulching of manure was applied, but the extreme heat of the past few weeks has induced an early flowering almost before these somewhat autumnal flowers are desired. Where blooms are required for exhibition three stakes should be placed triangularly to each plant, about fifteen inches or so apart at the base, and spreading outwards toward the top. To these the three main shoots should be secured, keeping the laterals pinched out. For the decoration of the garden and the house, however, this pinching of shoots is not necessary, as an abundance of flowers, and those of moderate size, are the more generally useful. Earwigs are often especially troublesome in dry seasons, and devour the dahlia blooms in a young state. These may be trapped in short lengths of dry bean haulm or small pots with a little dry hay or moss in them placed in an inverted position on the top of the stakes, or if thought unsightly, on shorter ones placed out of sight among the plants. Where exhibition flowers are desired, watering will be necessary if the weather continues dry, giving also an occasional soaking of liquid manure while the flower buds are swelling. Shrubby calceolarias have been a mass of flowers; as soon as fading they should be removed and a fresh growth and further blossoms be encouraged by affording moisture to the roots. Tuberous begonias also are seen to a disadvantage in seasons like the present, unless a mulching be applied and water in abundance given occasionally. The same remarks will apply to violas, fuchsias, and sub-tropical bedding plants generally, although the warm weather has, up to the present, been conducive to a free growth among the last mentioned plants. Bedding pelargoniums have flowered abundantly, the warm weather suiting their requirements. Spent blossoms should be promptly removed.

Among herbaceous subjects that may now be increased by division and cuttings, as soon as weather permits, are the double and single pyrethrums, and the old double-flowered white rocket, both extremely useful plants. The pyrethrums should be lifted, pulled into medium-sized pieces, with a portion of roots attached, and potted up into four or five-inch pots, using a rather sandy loam with a little leaf-soil. Give one good watering and stand them in a cold frame, keeping it rather close and shaded until root growth recommences, when shading may be gradually discontinued, and full exposure afforded. If a frame is not available they may stand under a north wall, or other shady spot, and be sprinkled overhead occasionally. When potted up in this way good plants are quickly formed, and they may be planted out in the autumn or early spring. To grow the double rocket well the clumps should be lifted annually, as, when allowed to remain longer, the plants dwindle away and throw but poor spikes, and in dry [illegible] die out entirely. If the flower spikes have been cut down as they have gone out of bloom, young growths will have started from the base, which afford a ready means of increasing the plant. These, if lifted and pulled off separately and replanted, will grow away and make strong plants for another season. It will be advisable to wait until rain falls, and a change of ground should be given, if possible, when replanting. A portion should be grown in the reserve garden, where propagation may be carried out, and the change from here to the [illegible] borders is of service in maintaining a healthy stock of plants. Afford water in sufficient quantity to well settle the soil about the roots, and sprinkle overhead in dry weather until the plants are established.

An important operation at this season is the layering of the border carnations. At the time of writing these are in full bloom, the season being a late one, but the plants should be taken in hand as soon as possible, otherwise the layers do not make strong plants before cold weather sets in. Previous to beginning to layer, slightly loosen the surface soil round the plants with a fork, make a sufficient number of hooks from birch, bracken stems, or such like, to peg the layers down with, about five inches in length, and prepare a quantity of moderately light, sifted soil to place around the layers to encourage the formation of roots quickly. The sifted refuse from the potting bench, mixed with a little fresh loam and leaf soil, forms a suitable mixture. Where the shoots on a plant are numerous, five or six of the outer and more conveniently-placed ones will be sufficient to layer from one plant. From these strip off the bottom leaves for a space of two or three inches, and with a sharp knife cut half way through the lower side of the shoot, passing the blade upwards through a couple of joints. Open the tongue [illegible] and press the stem into the soil, keeping the parts separated, fixing the [illegible] erect position, with a hook pressed down firmly on to the stem. The prepared soil should be placed round the plants in a saucer-like depression to facilitate watering, and the tips of each shoot layered should be snipped off as the work proceeds. If the beds are dry a thorough soaking of water should be given before commencing operations, and after layering a moderately moist condition should be maintained.—C. HERRIN, *Dropmore Gardens.*

HARDY FRUIT.

OF late years little attention has been paid to vines on walls, but [illegible] be secured from these, for last year we had very fair grapes on an eastern [illegible] so that a more favourable wall should give better results. Now is a good [illegible] stop lateral growth, and this is important, for unless the vine has full [illegible] sun, the crop will be poor. Feeding may now be done on a liberal scale, and [illegible] liquid manure from cowsheds or stables is one of the best fertilisers, and [illegible] weekly will build up a crop; failing liquid manure, such aids as guano or [illegible] may be given, but here it is better to give several weak doses in preference to [illegible] strong one. Where the bunches of grapes are get-atable, it well repays to [illegible] few of the best, as this hastens ripening, and the berries are nearly [illegible] size and of superior quality. Figs are not always grown so well as they [illegible] barrenness is often due to faulty culture, for figs will come to a large size, [illegible] plenty of them, if timely attention is paid to stopping and training of shoots. [illegible] some counties, of course, the fig will not thrive without shelter; but, still, [illegible] many places, luscious fruits can be grown. Now is the time to stop the [illegible] next season's fruiting, as it is well known these trees often grow [illegible] attended to weekly, and the wood robs the present fruits and prevents the [illegible]tion of next season's crop also. Young growths should now be tacked to the [illegible] but avoid overcrowding, as it is fatal to good cropping. One may often [illegible] season cut out a portion of the old wood and lay in new, but, at the same time, [illegible] portion of old, healthy wood, with spurs, should be retained, as upon [illegible] borne the earliest fruits. Keep the spur growths stopped at the fourth leaf, and cut out weak ones to give those left more room. Old trees that have failed [illegible] fruit freely may have a number of the old branches removed, and new ones [illegible] in; early next spring such trees may be root pruned, as this will induce [illegible]

[illegible] and mature. Trees in full bearing will benefit greatly by copious supplies of liquid manure, and to obtain fine specimens it will be necesssary to reduce crowded fruits on the younger branches.

The fruits of most kinds of dessert cherries have now been cleared, but the trees should not be neglected. I am aware, with so many other things needing attention, it is a difficult matter to provide food or moisture to trees that have borne a crop, but the roots of few trees dry more quickly than the cherry, and such kinds as Governor Wood, one of our best croppers, and a never-failing fruiter, soon flags and needs more moisture than trees which have deeper roots. Mulching should not be neglected, as, if given earlier in the season, it will be spent ere this, and another one needed to conserve the moisture given, as it is important to build up strong buds for the ensuing season. Such a season as we are now experiencing shows the value of giving fruit trees a free root run—that is, not cropping the border within at least four feet of the wall, as then a mulch, if only litter, will furnish the roots with the shade and moisture needed, and prevent "flagging," which is often the case in shallow soils. Newly-planted fruit trees of any kind are beginning to feel the effects of heat and drought, and any allowed to bear fruits should have the crop reduced if at all thick. With a thin soil or gravel we are obliged to mulch liberally, and find cow manure that has been laid up in heaps for a time the best mulch, as it retains moisture longer than most things. Apple and pear trees, bushes or pyramids, planted on grass are feeling the drought badly, and in places where the grass is coarse it will be best to cleanse the surface for a space of two or three feet, and give a mulch to encourage surface roots, and when liquid manure can be spared, it may be given with advantage. Late strawberries on north borders will now be over, and it will be well to make new plantations. Unfortunately, most of our best late varieties make few runners and a small growth, so that in planting this should be borne in mind, and the plants placed closer together; as these kinds usually remain for two years, it is important to give good soil. The new Lady Suffield strawberry promises to be a grand late fruiter, and will be a good companion to Latest of All, as it appears to come in with that variety. I wish Mr. Allan would give us a new and still later fruiter; we have Oxonion, but the quality is poor, though it is useful for its late cropping. Raspberries, owing to heat and drought, have had a short season, but those who prune for autumn fruiting will reap the advantage, as the plants are making fine growths. The summer fruiters should now have their old fruiting canes cut out, as this will allow the light to reach the new canes, maturing them for next season; the old canes are none too clean in light soils, red spider having spread freely of late, so that by removal it will in a measure destroy the pest also. Autumn fruiters should have their growths supported, and any weak growths may be cut away. These plants will well repay a liberal mulch or supplies of liquid manure. Gooseberry trees on walls or trellises for late fruit, should have the new foreright and side shoots closely spurred in, and it may be necessary to shade if on a warm wall, I prefer the north wall for these fruits. Young trees intended for cordon growing should be shaped and the leaders encouraged to extend. Bush trees that have not borne a heavy crop are making much growth, so we are reducing the lower shoots somewhat of those kinds that have a tendency to grow close to the soil.—G. WYTHES, *Syon Gardens.*

AMELIORATION OF FRUITS.

ALL our fruits, without exception, have, observed the President of the Irish Gardeners' Association at a recent meeting of that body, been so much improved by one circumstance or another that they no longer bear any resemblance, in respect of quality, to their original types. Who, for instance, would recognise the wild parent of the Victoria, the Coe's Golden Drop, or Greengage plum in the savage sloe, or that of the Ribston and Golden Pippin apples in the worthless, acid crab? or what resemblance can now be traced between the delicious Beurre pears, whose flesh is so succulent, rich, and melting, and that hard, stony, astringent fruit which even birds refuse to eat? yet these are undoubted cases of improvement, resulting from time and skill, patiently and persistently set in action. The constant dropping of water will not more surely wear away the hardest stone than will the [illegible] of the man in time compel all Nature to become subservient to his wants or his wishes; but it would be of little service to mankind that the quality of any fruit should be improved unless we found some efficient and certain mode of multiplying the individual varieties when obtained. Hence there are two great considerations to which it is above all things necessary that the attention of the cultivator should be directed, namely, amelioration and propagation.

Amelioration consists either in acquiring new and improved varieties of fruit or increasing their good qualities when acquired. It will be as well to consider these two subjects separately. By what means the first tendency to change their nature was given to domesticated plants we are entirely ignorant. It is probable that it was originally due to accident, and also that it was still mere chance which continued to operate down to modern times. There is in all beings a disposition to deviate from their original character when cultivated, or even in a wild state; but this disposition is so strong in some as to render them particularly adapted to become subject to domestication. Without, then, vainly endeavouring to discover the first cause of this disposition to form varieties, we may take it as a fact that such disposition exists. Cultivators increase this disposition chiefly in two ways—either by constantly selecting the finest existing varieties for seed, or by intermixing the pollen and stigma of two varieties for the purpose of securing something of an intermediate nature. The power of obtaining hybrids or cross-bred varieties at pleasure has only existed since the discovery of sexes in plants; but as it exerts a most extensive influence over alterations in the vegetable kingdom, it may be considered the most important controlling power that we possess.

In sowing seeds for the purpose of procuring improved varieties, care should be taken not only that the seeds should be taken from the finest existing kinds, but also that the most handsome, the largest, and the most perfectly ripened specimens should be those that supply the seed, a seedling plant always partaking more or less of the character of its parents. Now, if the general qualities of a given variety are concentrated in the embryo under any circumstances, it is reasonable to suppose that they will be most especially concentrated in a seed taken from that part of a tree in which its peculiar good qualities reside in the highest degree. For instance, in the fruit of an apple growing upon a north wall there is a smaller formation of sugar than in the same variety growing upon a south wall, and it can be easily understood that the seed of that fruit which is itself least capable of forming saccharine secretions will acquire from its parent a less power of the same nature than if it had been formed within a fruit in which the saccharine principle was abundant. It should, therefore, be always an object with a gardener in selecting a variety to become the parent of a new sort to stimulate that variety by every means in his power to produce the largest and most fully-ripened fruit that is capable of bearing. The importance of doing this is well known in regard to [illegible] and cucumbers, and also in preserving fugitive varieties of flowers. Mr. J. [illegible] stated, in conclusion, that this matter should be attentively considered by every gardener who wishes to excel in raising valuable varieties of fruit.

THE TUDOR GARDEN.

IT was not until the days of "the high and magnificent princes" of the Tudor line that gardens in our sense of the word were general throughout the realm. When in perfection they were equally stately and beautiful, and, in their natural variety, far superior to the commonplace blazes of colour in geometrical shapes which make up the modern garden, wherein all individuality seems sacrificed to conventionalism.

The Tudor garden at its best—as it served for the retiring-place of the learned and accomplished men who marked the era—is described in the noble essay of Bacon which is an English classic. In an age when *fin de siècle* self-conceit and shallowness finds all literature not "up to date" obsolete, and asserts that Scott, Dickens, and Thackeray (not to mention many another name) are "too long-winded," it may not be needless to quote some of those immortal phrases.

"God Almighty," says the statesman, lawyer, philosopher, and wit—whose intellect in its many-sidedness still stands unrivalled in the glory-roll of Britain—"first planted a garden; and, indeed, it is the purest of humane pleasures. It is the greatest refreshment to the spirits of man. . . . . I doe hold it, that in the royall ordering of gardens, there ought to be gardens, for all the moneths in the yeare; in which severally things of beautie may be then in season." Perhaps the nearest approach on a miniature scale to the Tudor garden is to be found in the delightful old-world cottage, one in such of the counties as lie "far from the madding crowd," in remote counties where the wheels of life move slowly, where the sight and smell are gratified as the wayfarer leans over the wicket which opens between the thick edges of whitethorn, and which is odorous on either side from the ample bush of sweetbriar always prominent in such gardens.

Whether the garden in the Tudor days lay stately behind the noble's castle or the less imposing but sufficiently substantial manor-house of the small landowner, or on a smaller scale ornamented the homestead of the flourishing and sturdy yeoman whose ancestors had dwelt for generations in the same place, there was a similarity in the flowers and fruits, the contour and proportions which marked it. As time went on the science of gardening improved, and thus during the Tudor reigns successively the system grew in beauty, until becoming that idealised by Bacon.

Before the reign of Henry VII. gardening as a general thing was little known in England. The monasteries had always encouraged cultivation; amid all the wars and woes of centuries the peaceful art of horticulture had been among the other benefits they conferred on a community torn by wars and feudal oppressions.

With the settled despotism of Henry VII. and his tyrant successor there was in things social that calm which, however deceptive, characterises the rule of an iron hand. And the spread of gardening on a much more elaborate scale was one of its accompaniments. Quaint and formal to our ideas these stately gardens, and yet with a wealth of delightful English blossoms, some of whose very names are poetry, and amid which fair maidens indulged in the high-flown language of euphuism, and the elaborate play on words which marked the conversation of fashionable youth of the period.

To the square garden with its fruit and flowers was usually added a smooth-mown bowling-green, and very often a fish-pond. Often in such ancient demesnes can the situation of the vanished fish-pond now grassed over be marked by the circular depression in the area of the turf. The red roses of the House of Lancaster were of course in the ascendant among flowers. Roses of various kinds, and that which, as Bacon says, comes later, "the musk"—the out of fashion, delightful, ancient rose which every rose lover of the genuine as distinct from the conventional class prizes wherever he finds it. Violets, daffodils, anemones, wall-flowers, double white violets, gillyflowers, pinks, sweetbriar, lilies, tulips, peonies, marigolds, periwinkles—white, purple, and blue—great favourites these, as will later be shown—hollyhocks, musk, crocuses, and hyacinths—these were the most esteemed flowers in the Tudor garden, as Bacon's fragrant list shows. But there were also according to "Euphues and his England" (black letter, 1605), which is a description of a visit in Elizabeth's reign to English country houses, "Sops in Wine" and "Sweet Johns." The hero of the story, who has arrived from Naples, remarks to some of the beauties who invite him with much word fervency, to choose a posy, "Here are so many in one plot as I shall never find more in all Italie."

No garden of the period probably surpassed that attached to the "fair house at Chelsea," where dwelt during his prosperous days Sir Thomas More. Statesman, orator, scholar, and wit, he was unsurpassed if equalled in Europe, and to the qualities which make up this description he added those of a gentle piety which never failed him in his after calamities, and a serene and high-tempered courage which enabled him to lay his head on the block with an innocent jest on his lips. At the time when his garden was in its greatest beauty, however, he was in high favour with Henry VIII. "The King," says Erasmus, More's great admirer, "would scarcely ever suffer the philosopher to quit him; for if serious affairs were to be considered, who could give more prudent counsel? Or if the King's mind was to be relaxed by cheerful conversation, who could there be a more facetious companion?"

Throughout the winding walks of that garden, bright and odorous with the flowers already named, the silver Thames flowing musically close by, Henry would walk in converse with More, his arm round his favourite's neck. Even then, however, amid the flowers and sunshine typical of the temporary sunshine of the capricious monarch's favour, the keen insight into human character which More possessed enabled him to see the shifting nature of that favour. Walking in that garden with his son-in-law, Roper, husband of that favourite daughter, Margaret, whose filial piety at "that last memorable scene" of More's life has immortalised her name, More was congratulated by his son-in-law on the King's favour and familiarity.

"I thank our Lord, son," said the calm philosopher, "I find his Grace my very good lord indeed, and I believe he doth as singularly favour me as any other subject within this realm; howbeit, son Roper, I may tell thee, I have no cause to be proud thereof; for if my head would win him a castle in France, when there was war between us, it should not fail to go." July 6, 1535, when "before nine o'clock of the morning" (by the despot's special order) More placidly laid his head on the block, verified his prescient words.

Trees of odorous blossom are among the charms of the Tudor garden as described by Bacon in words which make us perceive their waving boughs and multitudinous fragrance. The Victorian garden does not regard such bloom as among that which makes up the charm of petals. So much the worse for the modern garden and the limited ideas which define it. Above the old-world blossoms which loaded the air with fragrance from the borders were ample varieties of those which courted the higher airs three hundred years ago. First let us, however, recur to the periwinkle, always conspicuous in border and by shrubbery. It was sung as "pervinckle" by Chaucer five hundred years ago. It had in France and thence in England occult associations, and was supposed to be medicinal for various things—cramp especially. But particularly was the periwinkle, as the English rendering of the original name has it, popular from its long duration of blossom, and the trailing beauty of its foliage in contrast with the blossoms. So it is now with all who love the old ways in gardening and abhor the mere "bedding out" of a blaze of colour for a brief period of the year. To such as desire a feast for the eye most dear is the place where the

"periwinkle's bloom
Like carpet of Damascus loom,
Pranks with bright blue the tissue wove
Of verdant foliage."

The deep green of the leaves is one of the most refreshing sights to the eye in contrast with the deep blue of the blossoms—this being now the commonest variety, though as already mentioned showing popularity in the Tudor day with the white and lighter blue. Perhaps this flower, so neglected by the mere imitative fashionable gardener to-day, is so valued by those who can appreciate it from the fact of its being among the few blossoms which, in the days we describe as in the present ones, cheer the bleak aspect of the garden in November.

Of the flowering of trees our Tudor predecessors had a warm appreciation, and reckoned such blossoms as among the indispensable adjuncts of a garden. Nor were they wrong. In one of his letters to a correspondent, Lord Beaconsfield remarked that woodland scenery was that which unlike mountains and lakes never tired the observer. So of trees. No one who has any tincture of imagination in him can ever grow weary of watching the continual delights of a tree, even a solitary one in a London back garden. Some, of course, there are who, like the Lord Carnarvon of Pepys's time, think that trees "are only excrescences of Nature provided for the purpose of paying debts." But such are in the minority.

The favourite trees which added to the delights of a Tudor garden were varied. The pear trees in blossom were chief among them. And what lovelier sight does spring offer than apple, pear, and plum trees in bloom? The two former present to the eye

"One boundless blush, one white-empurpled shower
Of mingled blossoms."

As for the plum, its snow-white bloom stands alone. But for this tint and amplest luxuriance the flowers which robe

Of virgin whiteness, like the snow,
The clustered cherry,

are most opulent, because the cherry is so laden in every branch with its white blossom that not a leaf or stem is visible except where three or four leaves appear at the extremity of each branch. Well, then, instead of regarding the blossoms of these trees as mere preliminaries to fruit, as do our moderns, the Tudor garden lovers believed in those things of beauty, and ranked them among the most prized spring blossoms.

By the way, it would seem that the cherry-tree, though introduced into England in the Roman days, was first in fashion and excellence in Henry VIII.'s time. His fruiterer, Richard Haines, who seems to have been one of the fortunate members of his humbler *entourage* who preserved his favour—the loftier ones mostly found their way ultimately to Tower Hill—introduced new sorts from Flanders, and these were planted in Kent, whence grew the fame of Kentish cherries still flourishing. There is an account of a cherry-orchard in Kent in 1540 of thirty-two acres which produced fruit that sold in those early days for £1,000, an enormous sum, as land at that time let at a shilling per acre.

The blossoms of the mezereon with glossy green leaves and red but deadly berries, of the almond tree in crowded pinkness, of the "cornelian," of the hawthorn, the mayblossom always prized—though with that quaint country superstition (defied by London excursionists in the spring who load themselves with boughs) that "bringing it into house means death"—were also ornaments of the garden. There were other indispensable adjuncts—the rosemary and the lavender bushes, rivals in popular affection with the sweetbriar.

As for the evergreens, a glance at Bacon's essay shows us how our ancestors loved the winter beauties of the garden. "Such things," says he, "as are greene all winter" (speaking of November, December, and January), "holly, ivy, bayes, juniper, cipresse-trees, eugh, pineapple-trees, firre-trees." The mournful associations of modern life with yew and cypress seem unknown to the healthier mind of an era when there were no nerve "problems" or introspective novels.

Grass made a leading feature. Ample areas of well-mowed evergreen grass which should delight the eye. Not the scrimpy "lawn," with its limited space cut up into octagonal and other beds of verbenas and calceolarias. But space and verge enough to feast the eye and afford room for a bowling-green. The game was as popular then as golf is now. Whether the splendid imperturbability of Drake in finishing his game when the Spanish Armada was in sight would find its parallel now in any modern general or admiral playing golf when the enemy's battleships' smoke was clear on the horizon we will not say.

Of all the Tudor gardens the most thorough perhaps, and probably not nearly so delightful to its occupants as many humbler ones, were those of Kenilworth. The magnificent favourite whose memory is darkened with the mysterious and tragic story of poor Amy Robsart was successful in making his garden as himself—conspicuous among his contemporaries. Laneham has left a full description, albeit he seems, like a modern reporter, to have been obliged to observe it surreptitiously. To the north of the castle it lay a terrace ten feet high and twelve feet in breadth, even under foot, and fresh with evenly-mown greenest grass running parallel with the castle wall; obelisks and spheres were its ornaments, interspersed with stone effigies of the heraldic cognisance of Leicester, the white bear "on goodly bases." At each end stood a fine arbour redolent with trees, sweet of blossom, and various flowers. "Fair alleys of turf" marked the paths; others were paved in contrast with smoothest sea sand. The garden itself was divided into four even quarters. In the middle of each stood on a base two feet square a porphyry square pilaster with a pyramidical pinnacle fifteen feet high, pierced and hollowed and surmounted by an orb. All around these were the most fragrant flowers and herbs—showing the combination of the *utile* and *dulce* peculiar to the age—and mingled with these were fruit trees of all kinds. In the midst of the garden—an assimilation to more modern tastes—there was erected a square aviary twenty feet high, thirteen long, and fourteen broad, with large windows—two being in front, two at either end, and each five feet wide. These windows were arched and separated by flat pilasters, which supported a cornice. The roof of this aviary was made of wire-net, the meshes an inch wide. The cornice was gilded and painted in imitation of precious stones. With due attention to the habits of birds, eaves in the wall were added to the aviary, for shelter from sun and wind and for building. At either end stood "fair holly trees" for the birds to perch in. These comprised English, French, and Spanish ones, and probably here were some of the earliest canaries—literally from the Canary Islands.

In the middle of the garden was a fountain with an octagonal basin rising four feet high, two figures of athletes in the midst, standing back to back, and in their hands upholding "a fair marble bowl," from whence various pipes distilled continual streams of water into the reservoir. This latter contained carp, tench, perch, bream, and eels. On the top of all the ragged staff, the cognisance of the house, was displayed, while, with the usual taste for allegory which then prevailed, on one side Neptune drove his sea-horses with his trident, on the other stood Thetis with her dolphins.

Triton, Proteus, the Nereids, were "engraven with exquisite device and skill," surrounded by whales, sturgeons, tunnies, and conch shells. And characteristic of that love of practical joking which could and did exist simultaneously with wide and extensive classic learning and love of euphuism, and which some of the highest personages occasionally indulged in, there was a tap, by the turning of which any unwary spectator could be drenched at the pleasure of anyone knowing its effects, and who admired that sort of humorous performance.

Glancing at the humbler contents—the vegetables—of the Tudor garden, we do not find at the earlier part of the era such variety as in flowers. Indeed, according to Hume, there were not till the termination of Henry VIII.'s reign either salads, carrots, turnips, or other edible roots produced in England. He adds that such of these vegetables—a small proportion, and only by the wealthy—as were used were imported from Holland and Flanders, and that Queen Catherine, when she wanted a salad, could only get one by despatching a messenger thither on purpose. Hops were first introduced from Flanders in this reign, and also artichokes. Apples and pears, however, though indifferent in quality up to this era, had for centuries been acclimatised, and strawberries and gooseberries plentiful. As to salads, however, Hume's remark must be construed with some modification, for in a homely sense salads had always been procurable in England. Winter and watercresses abounded; the people had also "common alexanders" eaten as celery is; rampion, rocket, borage, and goose foot, or "Good Henry," are mentioned among herbs, while sprout kales served for greens, which, indeed, must have been much in request, seeing the quantity of salt meat eaten perennially. On the whole, however, until in Henry VIII.'s reign the Flanders gardeners exported their vegetables, the kitchen garden in England—save in the case of the monasteries—was very limited. The reign of the second Tudor saw many novelties, and so the art of gardening and variety of flowers and vegetables improved and increased, till culminating in the long reign of Elizabeth. Pippins seem to have been introduced in 1525, and the damask rose in 1522 had been brought to England by Linacre, the King's physician. Currants were brought from Zante and planted in England in 1533; and in the same year Cromwell, Earl of Essex, introduced the musk rose and several sorts of plums from Italy, while apricots are contemporaneous with cherries in 1540. So that by the time Bacon wrote his famous essay, both the Tudor flower and kitchen garden were well stocked with beauties and dainties. Undoubtedly the first general improvement in gardening is due to Holland about 1509, and the Dutch experts found apt pupils enough in garden-loving Englishmen of various ranks.

The main characteristic of the elaborated Tudor garden would seem to be its stately, simple, and ample scope and verge, within which it was the aim of the owner to cherish a succession of trees and flowers, so that from the beginning to the end of the year there might be always something to delight the eye. This might give a hint to some very ambitious modern gardens, which for a longer or shorter period look desolate, indeed, after having for a space blazed out into a brilliant array of colours. Some of the trees and flowers of the ancient days are neglected now by modern taste, but to the mind which can appreciate the full beauty of the idea there is a perennial charm in such a garden as Bacon sketches, which in varying degree and aspect was and would be now from January to December "a thing of beauty" and a "joy for ever."

F. G. WALTERS, in the *Gentleman's Magazine.*

Watering Vegetables.—A very erroneous idea prevails that, if watering is commenced, it must be carried out often, and many will not water crops, thinking they have not the time to continue. If necessity compels watering, better do this than sacrifice the crop, and after a thorough watering has been effected give a good thick mulch. There is no doubt some truth in the saying of not watering unless it can be kept up, because when watering is done it must be done thoroughly, or not at all, or else the roots are enticed to the surface or, any how, in an upward direction, and, unless mulching is effected, watering must be continued. But in very dry weather both mulching and watering are necessary for the production of high-class vegetables, which should always be fresh and tender, and the more percentage of water the vegetable contains, the more water will be required in comparison. It is very surprising what a good soaking of water will do to a crop, and in a little time. For instance, put a hose on to an onion bed for an hour or two, and you will see the difference to an inch where the water has gone and where it has not. Take another instance of a bed of lettuce. Those that are well supplied with water will be nice and crisp, and will break to pieces in your hand, whereas the one without water will be more like leather. Peas will soon give up unless watered in very dry weather, whereas those that are plentifully supplied with water will continue in good condition weeks longer.—W. A. COOK.

Vegetable Crops in Surrey.—During the past month I have had to judge literally hundreds of cottage gardens and allotments, sometimes from [illegible] per day, and over wide areas in all parts of the county of Surrey. Generally, [illegible] such gardens and allotments, because cultivated by the best cottagers and gardeners in each district, very admirable cultivation and cropping is found; yet [illegible] indeed, we see culture and crops that will excel those found in far more pretentious gardens. In every direction, on clay, sand, loam, chalk, or gravel—and we have great diversity of soil in the county—I have found the carrot crop to be a very bad one; probably it is the worst known within the memory of the oldest gardener. For one fair crop fifty are bad. The evil seems less that of an attack of maggot than of aphis, which seems to have smothered the foliage and fairly sucked it dry. Where the soil has been deeply cultivated and the bed liberally supplied with liquid soot or manure there the crop has been fairly saved. How few, it is feared, in spite of repeated adjurations to do so, sowed early varieties or intermediate varieties in July for winter pulling, as such sowings would have escaped harm. Parsnips are generally good, and the fly has done little harm after all. Beets are good, but too many stocks are coarse and unfit for garden culture. Onions are generally very good, especially [illegible] Tripoli's. But the finest I saw was on an allotment at Epsom. These were unmistakably Ailsa Craig, and grand bulbs they were, too. Potatoes are fairly good, but on shallow soils earlies are ripening off fast; no complaint of disease [illegible] Cabbages plentiful, but both white and reds far too coarse. Peas have been fair, though late ones have been rather blighted. Runner beans and dwarfs late, but good now; and broad beans have been excellent and plentiful. Altogether there is good prospect of being able to record a good vegetable season [illegible] —A. D.

EXHIBITIONS AND MEETINGS.

ROYAL HORTICULTURAL SOCIETY, August 9.

The holiday season had a slight effect upon the meeting of the above date as the Drill Hall was scarcely so crowded with exhibits or visitors as on some recent occasions. There was, however, a good display, water lilies, hollyhocks, dahlias, phloxes, stove plants, and gooseberries being the leading subjects on view.

FLORAL COMMITTEE.

As usual the bulk of the exhibits came under the adjudication of this committee, and most of the novelties gaining awards passed before them. Besides subjects already referred to there were good carnations, campanulas, some hardy shrubs, and nepenthes.

Mr. Owen Thomas, gardener to H.M. the Queen, Windsor, showed a collection of well-grown nepenthes, staging them on stands over a bed of maidenhair fern; a few especially good specimens were N. Curtisi superba, N. Rafflesiana, N. Morganiæ, N. Northiana, N. Mastersi, N. mixta, N. Dicksoniana, and N. Hookeriana. Sprays of asparagus were twined around the stand stems, and a few plants of Acalypha Sanderi were placed under the central tall stands; a fine exhibit; silver-gilt Flora medal. Messrs. J. Veitch and Sons, Chelsea, showed hardy plants, including a basket of the beautiful Eucryphia pinnatifolia, Cornus macrophyllus, Coprosma acerosa, with berries like pale blue glass beads, and Pavia macrostachys, with plumes of small creamy-white flowers. Dahlias were shown well by Mr. S. Mortimer, Rowledge, Farnham, who staged nine boxes of fresh and bright show and cactus varieties; among the latter we noted Starfish, vivid scarlet; Britannia, salmon; Matchless, deep crimson; Lady Penzance, yellow; Mrs. Nelson Noble, salmon and rose; and Major Hosskins, crimson scarlet, as particularly good; silver Banksian medal. Mr. J. Walker, Thame, Oxon, sent eight stands of show, cactus, and pompon dahlias, all fresh and bright flowers, if not over large; good pompon varieties were Sunny Daybreak, orange; Darkness, crimson; Dr. Jim, rose and crimson; Fairy Tales, pale primrose-[illegible]; and Bacchus, scarlet; silver Banksian medal. Messrs. Webb and [illegible], Saffron Waldon, showed a collection of named varieties of double-flowered hollyhocks on bright green boards; the flowers were very good, but needed presenting in some better style; Crimson Queen, Waverley, Rose Queen, Sunset, pretty pink; Primrose Gem, and Heliotrope were fine; bronze Flora medal.

Mr. J. Garrett, gardener to A. B. Freeman-Mitford, Esq., Batsford Manor, Moreton-in-the-Marsh, showed a lot of beautiful water lilies, almost all being M. Marliac's productions; flowers and leaves were arranged in two large [illegible] baths, and constituted a feature of the meeting. N. Marliacea albida, N. M. rosea, N. flammea, N. Marliacea chromatella, N. lucida, N. gloriosa, and N. ignea were in fine condition; a dozen varieties were shown and a silver Flora medal awarded. Mr. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, showed a charming lot of border carnations in bunches of a variety, all the leading sorts, and not a few new selfs and fancies were on view; Ketton Rose was especially good; bronze Banksian medal. A handsome group of campanulas was staged by Mr. G. Wythes, gardener to Earl Percy, Syon House, Brentford; the plants had pyramidal spikes from three feet to four feet nine inches high clothed with pure white or several shades of blue flowers. This is a fine strain that Mr. Wythes cultivates so well. The arrangement with Cocos [illegible] and maidenhair fern was very good; a silver Banksian medal was awarded.

From Messrs. W. Cutbush and Sons, Highgate, came an interesting group of hardy flowers, carnations, and sweet peas. Some good bunches of Pantheon, W. Robertson, Madame Antoine Denis, Jean Bart, and Charlemagne phloxes were most attractive, as also were Coreopsis grandiflora, Bocconia cordata, and Lobelia cardinalis; bronze Banksian medal. Mr. M. Prichard, Christchurch, contributed a select set of hardy flowers, showing, among other beautiful subjects, fine bunches of Asclepias tuberosa, Aconitum Napellus, Rudbeckia laciniata, Montbretia Pottsi grandiflora, Echinops sphærocephalus, Helenium grandicephalum striatum, Podophyllum Emodi, in fruit; Tigridia Pavonia, and Lathyrus latifolius roseus; silver Banksian medal. Messrs. Kelway and Son, Langport, Somerset, occupied the whole side of one table with a display of gladiolus and other subjects. Michauxia campanuloides, Yucca filamentosa, Achillea Eupatorium, and Eryngium alpinum were well represented; so also were the Kelway gaillardias. Among the gladioli we noted Mr. Fowler, red and cream; Duke of Buccleuch, pink and crimson; Lewcole, orange; Orme, lilac and rose; Numa, blush and cream; Gallia, rosy-heliotrope; and Vigilante, purple, as having especially fine and handsome flowers. A good idea of the display can be obtained when we state that [illegible] dozen spikes were staged, all strong and well furnished; silver Flora medal. A pretty display was made by Messrs. R. Wallace and Co., Colchester, and consisted of a large central group of Lilium auratum in several handsome varieties, flanked by sheaves of tritomas, montbretias, gaillardias, border carnations, and two pans of the bright golden Sternbergia macrantha; silver Banksian medal. A pan of water lilies, together with photographs of nymphæas as growing in a lake, were shown by W. Robinson, Esq., Lincoln's Inn Fields; not many of the flowers were expanded, but the leading Marliacea forms were present; bronze Flora medal. Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, also sent water lilies, showing two dozen sorts, together with [illegible] foliage, all taken from a lake in the open; Nymphæa lucida, N. [illegible] rosea, N. alba, N. Marliacea chromatella, N. M. carnea, N. M. rosea, and N. [illegible] were especially fine. Fine flowers of the lovely blue Nymphæa [illegible], a species that needs the water slightly warmed to grow in, were also shown by Mr. Hudson; this produces its flowers on long stalks that lift the blooms well out of the water; silver Banksian medal.

Mr. Kelf, gardener to Miss Abbot, South Villa, Regent's Park, put up a first-rate group of plants, chiefly palms, caladiums, crotons, dracænas, pandanus, [illegible], ferns, dieffenbachias, cannas, liliums, and asparagus. The group was a large one, well set up, and the plants were clean and well developed; silver-gilt Banksian medal. On this occasion Mr. H. B. May, Edmonton, set up a group of some two dozen species and varieties of nephrolepis, these making a handsome exhibit. Some of the plants were large and lovely specimens, notably N. exaltata [illegible], N. rufescens tripinnatifida, N. exaltata furcans, N. c. plumosus, and N. [illegible] Bausei; silver-gilt Banksian medal. Messrs. Wm. Paul and Son, Waltham Cross, staged quite a bank of the elegant spikes of Yucca flaccida, they also sent a splendid lot of double hollyhocks from seed, magnificent blooms on stout, well-[illegible] stems. Phloxes from Waltham Cross were splendid in size and colour; [illegible], Mons. Thibaut, Oriental, Oscar Beyer, Etna, Purity, Lord Rayleigh, [illegible] Bechner, and Roxelaine were all varieties splendidly represented; silver [illegible]. Messrs. Sander and Co. showed some new hybrid begonias and [illegible] Watsoniana, a handsomely variegated plant with long leafage. Carnations were shown by Mr. R. Sisley, Ockford, Godalming, but there was nothing of special merit in the display. Messrs. J. Veitch and Sons exhibited their new border carnation, George Maquay, a pure white variety, of good form and habit. The Chelsea firm showed an interesting plant, a hybrid between Rochea falcata and Kalosanthes coccinea; it was named Kalo-rochea Langleyensis; the Kalosanthes was the seed parent; the plant is intermediate between the two parents. The Chelsea firm had also a splendid collection of annual flowers. Mr. J. Crook, Forde Abbey, Chard, sent a box of blooms of the curious Gloriosa superba. A goodly display of carnations was made by Mr. James Douglas, Edenside, Great Bookham; some of the newer selfs, like Queen of Scots, Mrs. Colby Sharpin and Mrs. Grey, Buchanan, and Nox, deepest crimson, were all beautiful; the fancy forms were also good.

ORCHID COMMITTEE.

Orchids were almost conspicuous by their absence, but on a corner of one table there were seven plants and a spike or two. Mr. J. Douglas, Great Bookham, exhibited a fine form of Denbrobium formosum giganteum with immensely broad petals. Messrs. Hugh Low and Co., Clapton, showed a few cattleyas, a handsome variety of Oncidium papilio, and a plant of Cypripedium Olivia carrying one large and handsome flower. A tall spike of Vanda Batemanni, carrying twenty flowers and buds, was shown by Mr. C. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate. Mr. G. Shill, gardener to G. Law Shofield, Esq., New Hall Hey, Manchester, sent a very small plant of Odontoglossum crispum Lehmanni, Schoefield's var., a very prettily-marked form that will improve with age.

FRUIT COMMITTEE.

A magnificent exhibit of gooseberries from Messrs. J. Veitch and Sons, Chelsea, was also an extensive one, and merited a gold medal. There were no less than a hundred and six varieties staged, but, of course, this number is largely reducible for small gardens. The best red varieties for dessert were Forester, Champagne, Keen's Seedling, and Warrington. The best green and yellowish varieties were Langley Beauty, Whitesmith, Transparent, Pretty Boy, Broom Girl, Coiner, Early Sulphur, Legerdemain, Keepsake, Langley Gage, Yellowsmith, and Golden Drop. The Chelsea firm also displayed some splendidly-fruited white and red currant growths, and also staged trays of fruit, the trays of La Versaillaise and Cherry currants being first-rate; the firm also showed some late cherries. The raspberry-blackberry hybrid raised by Mr. Seden was shown, and is a remarkable fruit of large size, and precisely intermediate between the two parents, both in growth, size of fruit, and flavour; a decided acquisition to succeed the raspberries, if only the fruits parted readily from the stem.

Mr. Kelf, gardener to Mrs. Abbott, South Villa, Regent's Park, set up a fine collection of fruits showing plums on pot trees, dishes of plums and gages, Bellegarde, Royal George, and Barrington peaches, finely developed; Buckland Sweetwater, Black Hamburgh, and Muscat of Alexandria grapes, and good melons; all this fruit was grown within two miles of Charing Cross, and the able gardener thoroughly merited the silver-gilt Knightian medal awarded. Messrs. Harrison and Sons, Leicester, staged a very comprehensive collection of broad beans, showing a remarkable difference in the size of pods from the immense John Harrison to the small Beck's Gem; Longpod, Harlem Windsor, Invicta, &c., were all represented. Messrs. T. Rivers and Sons, Sawbridgworth, staged a beautiful lot of cherries, plums, and gages finely developed, highly coloured, covered with bloom, and well arranged. Especially grand was the basket of Early Rivers nectarine, grown in a cold orchard house on pot trees. Silver Banksian medal. Mr. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, had an exhibit of well-grown peaches, plums, gages, melons, &c., all shown in that excellent condition that invariably characterises Mr. Miller's produce; silver Knightian medal. Mr. Carmichael, Edinburgh, sent strawberry Britannia, a pleasantly flavoured late variety. Messrs. Kelway and Sons, Langport, Somerset, showed the new strawberry-raspberry in good condition. Mr. A. Dean, Richmond Road, Kingston, showed a dish of Snowball turnips in fine form.

HEADINGTON HORTICULTURAL SOCIETY, August 1.

The eighteenth exhibition was held in the grounds of the Manor House, Old Headington, and proved quite a success financially and otherwise. Some three thousand persons passed through the tents during the afternoon, including the whole of the school children in the district, and the wives and children of the non-commissioned officers at the military barracks at Cowley, the colonel's lady (Hon. Mrs. Kingscote, The Beeches) having provided the tickets of admission. Entries were more numerous than for the past two seasons, and a fair standard of quality was maintained in nearly all the classes. The non-competitive exhibits included a fine bank of tuberous begonias very effectively arranged by Mr. J. Stringer, gardener to Thomas Arnall, Esq., Brookside, Headington Hill; the plants numbered nearly forty full-sized specimens, and were a batch of seedlings of a most excellent strain, and were single and double. One other exhibit also made a mass of colour; no less than forty-two bunches of tea-scented rosebuds, in vases and mounted on black velvet; these formed a background to three dozen blooms of hybrid perpetual roses of full exhibition merit, Mr. J. Mattock being the exhibitor. From Mr. George Chaundy, jun., New Marston, came two dozen specimen carnations of high quality, some of the yellow-ground being simply lovely.

PLANTS.—In division three, prizes were offered for groups for effect on a space eight by four feet. Three competed, the premier arrangement was a most graceful semi-circular cone-shaped pyramid, having a feathery Grevillea robusta as the centre, around which were posed cannas, Lilium lancifolium album and rubrum, cocos palms, dracænas, clove carnations, fuchsias, streptocarpus, celsias, Trachelium cæruleum, and edged by blue lobelia and variegated forms of panicum and sedum; this secured the first card to Mr. W. Clarke, flower gardener to Mrs. S. Wootten-Wootten, Headington House; the second prize going to Mr. W. T. Mattock, Blenheim Nursery, Barton, who had masses of very showy tuberous begonias, cocos palms, Acalypha muscaica, coleus, pancratiums, zonal geraniums, Lilium auratum, the centre being a number of spikes of Ornithogalum pyramidale, the ground line being edged blue lobelia; Mr. J. Green, Church Lane, third, with very useful bits of greenhouse subjects. The best three plants in the amateurs' section came from Mr. Green; they were neat fuchsias, but the varieties were not named. There was a lot of pretty plants suitable for table decoration, Mr. W. T. Mattock leading in the class for six; Mrs. Wootten-Wootten second. The cottagers' fuchsias and geraniums were dwarf grown and well flowered, the prizes for a window plant going first to a depending mass of the blue Campanula carpatica; second to fuchsia Lucy Finnis; and the third to fuchsia Charming.

CUT FLOWERS made a very pretty feature. For twenty-four roses Mr. J. Mattock (who was in fine form) took first prize, his premier blooms being Marshal P. Wilder, Maréchal Niel, Marchioness of Londonderry, Marie Baumann, Her Majesty, A. K. Williams, Mrs. J. Laing, Horace Vernet, Comtesse de Nadaillac, Comte Raimband, Marie Verdier, Alfred Colomb, Madame S. M. Rodocanachi, General Jacqueminot, Dupuy Jamain, and White Lady; Mr. W. T.

Mattock, second, his best forms being Marie Baumann, La France, Ernest Metz, Earl of Dufferin, and Elise Vardon. For a dozen varieties, Rev. J. H. Scott-Tucker, Headington Vicarage, led with very fine forms of Horace Vernet, Marchioness of Londonderry, Comtesse de Nadaillac, Alfred Colomb (premier bloom in the show), The Bride, Pierre Notting, Ernest Metz, Marie Baumann, and Catherine Mermet; he was likewise first for six, having a nice development of Merveille d'Lyon, besides others previously mentioned. Mr. J. Green was the only exhibitor of nine varieties. Cut zonals was another excellent class, Mrs. Wootten-Wootten taking the card for six triplet trusses (very nicely posed) of Phrynne, Mons. Calvat, Lady Chesterfield, Radha, Sherlock Holmes and Mary Clarke; Rev. J. H. Scott-Tucker, second. Herbaceous perennials were staged as bold gatherings calculated to display the habit of growth; Mrs Wootten-Wootten, first for six varieties, puttting up Achillea millefolia, A. serratifolia, Harpalium rigidum, Statice latifolia, Lilium testaceum, and Lathyrus latifolius alba; Mr. W. F. Cross, Iffley Row, Oxford, second, with some of the above, and phloxes, Chrysanthemum maximum, and the scarlet Martagon lily; Mr. W. T. Mattock, third. The bouquets in groups of nine each were specimens of artistic floral arrangement, Mr. W. T. Mattock, and F. Gurden, Headington Quarry, taking the cards; the best collection of annuals coming from Mr. A. Whitehead, gardener to Dr. Niel, Warneford Asylum, Headington.

FRUIT was very fine, it being all of outdoor growth. For six dishes Mr. W. Coppock, The Yews, Headington Quarry (whose garden is in a deep disused stone pit), was placed first for fully-ripened Large Early apricots, Juneating apples, London gooseberries, Prolific plums, Bigarreau Napoleon cherries, and Magnum Bonum red currants; these last named were a wonderful exhibit; Mrs. Wootten-Wootten, second, with Large Early apricots, Prolific plums, Baumforth Seedling raspberry (a large form of this delicious fruit), Morello cherries, White Dutch and Magnum Bonum currants; Mr. A. Louch, postman, Headington Quarry, third, his very beautifully-finished varieties being Eleanor strawberries, Juneating apples, Doyenne d'Ete pears, Glory of Old Port gooseberries, Early Favourite plums, and Bigarreau cherries. For three dishes, the first card went to Mr. C. Bodimeade, gardener to Sir W. Markby, Headington Hill, who staged Rivers' apricots, Morello cherries, and Lord Derby gooseberries; Mr. W. Mattock, second, with Royal George peaches, strawberries, and gooseberries; while for one dish (amateurs), Fastolf raspberries, Morello cherries, and Kerry Pippin apples took the cards; the cottagers being wonderfully good in the way of big gooseberries, currants of sorts, raspberries, &c., the best dessert apples being Juneating and Quarrenden; the culinary varieties were Warner's King and Blenheim Pippin.

VEGETABLES were a somewhat extensive feature, Mr. G. Silvester, gardener to Mrs. Wootten-Wootten, was first in Messrs. Sutton and Sons' class for six dishes; Mr. Bodimeade, second; and Mr. J. Green, third. The competition for potatos in three varieties each of kidney and round forms was in the hands of the same exhibitors, while Mr. Green proved the only competitor for similar products in the amateur classes. The cottagers were strong in the way of all the bean classes, while among the winning dishes of potatos the following were named: Puritan, Reading Ruby, Cole's Favourite, Chancellor, Satisfaction, White Hebron, Mr. Bresee, Snowdrop, King of the Russets, Reading Russet, Windsor Castle, and Renown. Short carrots are always well shown here, Mr. F. Morris leading with very well-grown specimens. Autumn onions were of large size and approaching ripeness, the spring-sown forms evidently have some growth yet to make ere they touch the exhibition size. One of the cottagers had some very nice tomatos, he possessing a glass structure. A great portion of the soil in the district is sandy, so the bulk was perhaps less than in a showery season.

THE MIDLAND COUNTIES CARNATION AND PICOTEE SOCIETY, August 5 and 6.

MR. R. SYDENHAM and the committee of the above society may be heartily congratulated upon the exhibition held in the Botanical Gardens, Edgbaston, on the above dates. It was a superb display of the carnation; the bizarres, flakes, yellow grounds, selfs, and fancies were represented in the finest character, and it was somewhat remarkable that not a northern exhibitor scarcely staged flowers; the district cultivators made the show, assisted largely by Mr. Martin R. Smith, Mr. James Douglas, and Mr. J. A. Rowberry from the south. The classes were all well filled; the quality of the bloom was high throughout; the show house of the Botanical Gardens was filled to overflowing, and the weather being fine there was a large attendance. It appears to be pretty certain that the carnation exhibition at Birmingham will be almost invariably the most extensive of the three shows held during the year. It may be added that the Botanical Gardens can now be seen at their best, and the plant houses are exceedingly gay.

SELF CARNATIONS had the place of honour assigned them in the schedule. There were ten stands of blooms, and most of them were very fine. It is not to be wondered at that the visitors at a carnation show are attracted by these brilliant blooms. They do not understand the technical differences set up by the florist, and lacking anything like conception of the properties of the refined bizarres and flakes, they turn to the selfs, and see in them much to gratify. It is so with the splendid yellow grounds and the fine fancies. The best twelve self carnations were staged by Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, Kent. They were Cecilia, yellow; The Maid and Helmsman, white; Etna, scarlet; Ensign, white; Midas, orange; Purity, white; Gadabout, yellow; Joan of Arc, rose; Benbow, salmon; Conqueror, rose; and Comet, crimson; second, Mr. R. Sydenham, Birmingham, with Sea Gull, blush; Little John, carmine; Germania and Regina, yellow; Mrs. E. Hambro, white; Mrs. Colby Sharpin, apricot; Uncle Tom, &c.; third, Messrs. Thomson and Co., Birmingham; fourth, Mr. James Douglas. There were seventeen entries of six selfs. Mr. A. W. Jones, Handsworth, Birmingham, was first, with Exile, Mrs. Eric Hambro, Sea Gull, Miss A. Campbell, Mrs. C. Sharpin, and Mancunian, the last one of the darkest grown; second, Mr. R. C. Cartwright, Birmingham, with Mrs. Eric Hambro, Exile, Regina, Her Grace, Sea Swallow, and Ruby; third, Mr. C. F. Thurstan, Wolverhampton.

YELLOW GROUND PICOTEES.—There were seven stands of twelve yellow ground picotees, Mr. C. Blick taking the first prize with a splendid lot of blooms; he had Lady Bristol, Hesperus, Gadabout, in this case having a picotee edge of rose, Badminton, Professor, Empress Eugenie, Aglaia, Hygeia, Mrs. Jordan, Busybody, Gazelle, and Voltaire. Mr. J. Douglas, Great Bookham, was second, also with very fine blooms, having Heather Bell, Dervish, Voltaire, Mohican, Wanderer, His Excellency, Mr. Nigel, Hygeia, and others; third, Mr. R. Sydenham; Messrs. Thomson and Co. being fourth. There were sixteen entries of six yellow grounds, and here Mr. R. C. Cartwright was first, with very fine blooms indeed of Voltaire, May Queen, Golden Eagle, Mr. Nigel, Countess of Jersey, and Eldorado; Mr. A. R. Brown, Handsworth, was second, having in fine character The Gift, May Queen, Golden Eagle, Voltaire, Eldorado, and Mr. Nigel; third, Mr. W. Bellamy, Penkridge. Twenty-one competitors entered for the class for six fancy carnations, Mr. C. Blick taking the first prize with very fine blooms indeed of Mercar, Queen Bess (very novel), Alexandra, Goldylocks, Perseus, and Hidalgo, every one of them good enough for a premier award; second, Mr. R. Sydenham, who had Monarch, George Cruickshank, Perseus, Little [illegible], The Czar, and Phœbus; third, Mr. J. Douglas, who had highly promising blooms of The Czar, Czarina, and Zingari.

WHITE GROUND PICOTEES.—These followed in the order of the schedule, six stands of twelve varieties competing, Mr. R. Sydenham taking the first prize with a superb lot of blooms consisting of H. Red E., Ganymede; H.P.E., Mrs. Openshaw, Miriam, and Muriel; L.P.E., Jessie and Ann Lord; H. Rose E., Lady Louisa and Little Phil; L. Rose E., Fortrose; H. Scarlet E., Mrs. Sharp; L. Scarlet E., Favourite and Dolly Dimple. Second, Mr. A. R. Brown, Handsworth, who had Brunette, Mrs. A. R. Brown (H. Rose E.), Miss Anderson (H.P.E.), Little Phil, Grace Ward (L. Rose E.), Ganymede, and Harry Kenyon as his leading blooms. Messrs. Thomson and Co. were third. There were nineteen entries of six picotees, Mr. A. W. Jones, Handsworth, taking the first prizes with highly refined blooms of Thomas William (L. Red E.), Mrs. Openshaw and Amy Robsart (H.P.E.), Mrs. Payne, Little Phil, and Mrs. A. R. Brown (H. Rose E.) Mr. R. C. Cartwright was second, having Ganymede, Amy Robsart, Little Phil, Mrs. Sharp, Pride of Leyton (L.P.E.), and Mrs. Payne. Mr. W. Bellamy, Penkridge, was third.

SHOW CARNATIONS.—In the class for twelve carnations there were eight entries, Mr. R. Sydenham being again first with very fine blooms, having scarlet bizarres, R. Monk and Edward Adams; crimson bizarres, Mrs. J. Burgess, Master Fred, and J. S. Hedderly; pink and purple bizarres, Sarah Payne; purple flakes, George Melville and Gordon Lewis; scarlet flakes, John Wormald and Sportsman; rose flakes, Mrs. Rowan and Thalia. Second, Messrs. Thomson and Co., whose best flowers were: S.F., Sportsman; S.B., Robert Houlgrave; R.F., Mrs. Moy, Thalia, and Cristi-galli; C.B., J. D. Hextall and Master Fred; P.F., Gordon Lewis. Third, Mr. R. A. Brown. There were eleven entries of six carnations, Mr. C. F. Thurston, Wolverhampton, taking the first prize with S.B., Edward Adams; C.B., J. S. Hedderly; P.P.B., Arline; P.F., George Melville; S.F., Sportsman; R.F., Mrs. Moy. Mr. F. W. Goodfellow was second, and Mr. G. Faulkner third. There was a class for six carnations for maiden growers, any types. Mr. T. F. Dranfield was first, setting up all fancies, including Voltaire, May Queen, Monarch, and Eldorado. Mr. W. H. Twist, Birmingham, was second, he having all white ground picotees.

VASES OF CARNATIONS AND PICOTEES.—Then followed a series of classes for undressed blooms in vases with foliage, but without wires and as "little dressing" as possible. What amount of dressing is permissible under the term "little" appears to be left to the cultivator, but that most of the blooms had undergone some touching up with the tweezers there can be no doubt. Out of six competitors Mr. R. Sydenham staged the best twelve selfs, Mr. M. R. Smith was second, and Messrs. Thomson and Co. third. In the class for six selfs there were numerous exhibitors, Mr. W. Bellamy was first; Mr. R. C. Cartwright, second; and Mr. C. F. Thurstan, third. Mr. M. R. Smith had the best twelve fancies or yellow grounds; Mr. J. Douglas was second; and Mr. R. Sydenham, third. There were seventeen entries of six blooms of fancies, Mr. Cartwright was first; Mr. Thurstan, second; and Mr. G. Chaundy, third. There were but three entries of twelve white ground picotees, Mr. R. Sydenham was first; Mr. A. R. Brown, second; and Messrs. Thomson and Co., third. There were fourteen entries with six white ground picotees, Mr. C. F. Thurstan was first; Mr. Cartwright, second; and Mr. W. Bellamy, third. There were fifteen entries of six blooms of any type, Mr. Cartwright taking the first prize; Messrs. Thomson and Co. were second; and Mr. M. A. Smith, third. But very few of the blooms were named, and it is just possible that two sets of judges might be found to differ widely in making the awards in the foregoing classes.

SPECIMEN BLOOMS.—The classes for single blooms formed quite an exhibition of themselves, as they covered a large space of table, and were finer in quality than is generally seen in these classes. Taking the carnations first, the scarlet bizarres were placed in the following order: Admiral Curzon, though distributed more than fifty years ago, taking the first prize; Robert Houlgrave, which is regarded as a seedling from the Admiral, was second, third, fourth, and fifth. The leading crimson bizarre was Master Fred; followed by J. S. Hedderly, second and fourth; Master Fred being third and fifth. The best pink and purple bizarre was William Skirving, which was also second; Sarah Payne was third; George Rudd, fourth; Cooper, fifth. Sportsman, Scarlet flake, a sport from Admiral Curzon, which originated some forty-eight years ago, took all five prizes in the class. Thalia was the best Rose flake, and it took the second and fourth prizes also; Merton was third; and Mrs. Moy, fourth.

Of single blooms of picotees there were also many. In the red edged section Ganymede was first, second, third, and fourth, and Brunette fifth. Thomas William was first, second, and fifth in the light red edged class; Mrs. Gorton, third and fourth. Muriel was the best heavy purple edge; it was also third and [illegible]; Mrs. Openshaw taking the second and fifth prizes. The best light purple edge was Harry Kenyon; Ann Lord was second and third; and Pride of Leyton fourth and fifth. Mrs. Payne took the first and second prizes as a heavy red edge; Little Phil was second; and Lady Louisa, fourth and fifth. The best light [illegible] edge was Favourite, and it was third and fifth; Fortrose was second; and Mrs. Payne, with a wire edge of colours, fourth.

A large number of selfs were staged, and the value of Mr. Martin R. Smith's Mrs. Eric Hambro as a white self was shown by the whole of the five prizes being awarded to it. The best yellow buff or terra-cotta self was Benbow (Smith), a distinct and attractive salmon-buff variety. Regina, a yellow self, was [illegible], third, and fifth, and Cecelia fourth. The best rose-pink or salmon self was [illegible] rose, and it was placed second also; Royalty, rose, was third; Ada fourth, and Mrs. Felecity fifth, both of rose shades. The best scarlet self was Etna. [illegible] Parkinson was second, and Grandeur fourth; two seedlings were third and [illegible]. The best dark self was Uncle Tom, Sir Berrys took the second prize; Mancunian was third and fourth, and Negress fifth.

Wire edged yellow picotee Mrs. Douglas was first, Seraph second, Mohican third and fourth, and Ladas fifth. The best medium or heavy-edged [illegible] was Voltaire, which was second also; Wanderer was third and fifth; and [illegible] fourth. The best fancy carnation was Lady Ardilaun; Cardinal Wolsey was second; Monarch third and fourth; and Ossian fifth.

PREMIER PRIZES.—The premier bizarre carnation was a very fine bloom of Master Fred, C.B., shown by Messrs. Thomson and Co.; the best flake, [illegible] Gordon Lewis, shown by Mr. R. Sydenham. The best heavy-edged picotee, [illegible] Rose, Mrs. Payne; the best light edged, L. Red, Thomas William, [illegible] Mr. A. W. Jones. The premier self, Mr. Martin R. Smith's Benbow, a [illegible] which did not appear to give general satisfaction; the premier yellow ground [illegible] picotee Hygeia, also from Mr. Smith; the premier fancy Queen Bess, from the same raiser, a novel and distinct though somewhat dull-looking flower of [illegible] quality.

BORDER CARNATIONS were not so fully represented as might have been expected. Mr. Martin R. Smith secured the first prizes for twelve varieties of [illegible] flowers, and also for the same number of yellow grounds and fancies, and though the only exhibitor, fine and promising varieties were staged. In the classes for six bunches, Mr. Weguelin, Teignmouth, was first; and Mr. A. J. Rowberry, South Woodford, second. None of the varieties were named.

Plants in Pots were represented by two half-dozen specimens. Messrs. Thomson and Co. were first, having principally yellow grounds and fancies; and Mr. R. Sydenham second, whose leading varieties were selfs. The prizes offered by Mr. Ernest Benary, Erfurt, for six pots of his varieties brought no competition.

Floral Decorations with carnations appeared as tables prepared for dinner, the first prize going to Miss Monk, who had a light arrangement of white and yellow carnations and appropriate foliage; Mrs. Lovatt was second, but, to our taste, employed too much scarlet; and Miss Swinden was third. Some pretty shower bouquets of carnations were staged; Captain Shawles was first, a pretty salmon-pink carnation and appropriate foliage being employed; Mr. M. R. Smith was second, and Messrs. Thomson and Co. third. Sprays and buttonholes were also staged.

Special Prizes were offered for the other exhibits. One class was for nine bunches of sweet peas, which brought several charming collections. Mr. W. Bellamy was first; Mr. A. Bessell, second; and Mrs. Lovatt, third. Eckford's varieties were employed. Epergnes of sweet peas were also invited, most of them very good. Mr. E. Romolo, who employed mixed varieties, was first; Mrs. Lovatt was second, who employed carmine, pink, and blue; and Mr. A. Bessell, third. Mr. Eckford also offered special prizes for twelve varieties of sweet peas, and several charming collections were set up; Mr. V. B. Johnston was placed first; and Mr. A. Bessell, second. Mr. Lovatt had the best twelve bunches of herbaceous and perennial blooms, competing for special prizes offered by Mr. W. B. Child; Mr. L. W. Lees, Tettenhall, was second.

The Sydenham Amateur Challenge Cup was awarded to Mr. C. Blick; the Midland Counties' Challenge Cup to Messrs. Thomson and Co.; Mr. R. Sydenham won the Birmingham Botanical Society's silver medal, and Messrs. Thomson and Co. their bronze medal.

No certificates of merit were awarded to new varieties, though a fair number were staged.

Miscellaneous Exhibits included a magnificent group of begonias from Mr. B. R. Davis, nurseryman, Yeovil, which was awarded a silver-gilt medal. Collections of hardy plants from Mr. W. F. Gunn, Olton, and Messrs. Hewitt and Co., Solihull, awarded silver medals; also one from Mr. J. H. White, Worcester, awarded a bronze medal; while a silver medal was awarded to Mr. Henry Eckford, Wem, for a superb collection of sweet peas. Mr. R. Sydenham also had pretty floral decorations, and Mr. James Douglas and Mr. Charles Phillips, Bracknell, new carnations.

On the evening of the opening day of the show Mr. R. Sydenham entertained the exhibitors, judges, &c., at supper in the luncheon tent, when various suggestions were thrown out with a view to the improvement of the exhibition.

THE BRITISH PTERIDOLOGICAL SOCIETY.

As usual on the August Bank Holiday, the members of this society met at Bowness, Windermere, for their annual conference, which was fairly well attended, but not at all on the scale it merits as the sole representative body of British fern lovers. It seems next to an impossibility to bring home to the minds of the British people or British lovers of plants that our native ferns, few as they are in species, far and away eclipse in their lovely varietal forms those produced by the entire outside world. Some of the tropical and sub-tropical islands, as well as those of New Zealand, ranging from sub-tropical to temperate, boast their hundreds of species, many of them of great beauty. Whether it is the fault of the botanist or foreign or colonial fern lovers, or whether Great Britain is peculiarly favoured with "sports," we know not; but the fact remains, that for such sports, curious or beautiful, our islands have yielded their thousands.

In the lake district and thereabouts a large number of people are aware of the merits of these varieties as decorative plants, and in the windows and gardens of many of the cottages pretty and well-grown specimens are seen, while fine collections are by no means rare. One result of this was the formation some years ago of a purely local society in Kendal called the Northern British Pteridological Society, and consisting of a coterie of ardent fern fanciers, who not only cultivated these ferns, but sought for and found new ones in the fern-clad hills and vales of lakeland. Then their ranks were swelled by other fern lovers from far and near, and the "Northern" was dropped, so as to embrace all who cared to join. Once a year the members meet, bringing plants and fronds of new or old varieties for naming or identification, thus forming a legitimate centre for the cults, and affording an opportunity for improved nomenclature and accordance of that confusion worse confounded, induced by incompetent judges, who name without the requisite knowledge. Encouragement is also thus given to improvement of types on regular lines, and we are confident that, had such a committee existed in the days when British ferns were fashionable, and any irregular or unsymmetrical monstrosity fetched its price if new, such a weeding out would have taken place as would have obviated the surfeit to which indiscriminate culture eventually led. The subscription of 5s. per annum is practically nominal, and is devoted to the publication of a pamphlet, giving several papers by experts, and embodying much interesting information. The secretary, Mr. Whitwell, Serpentine Cottage, Kendal, is one of the old school of enthusiasts, one of the keenest hunters and most successful finders living, and has a wonderful collection.

The President (Dr. Stansfield) occupied the chair, and in opening the proceedings, referred to the loss the society had sustained during the year by the death of three of its members, namely, Messrs. Pease (Darlington), Tyldsley (Worsley), and [illegible] (Sheffield). He also referred to the improvement of Bolton's A. f.-f. clarissima in the hands of Mr. C. T Druery, by the elimination of the tendency to produce coarse and imperfect fronds, and also gave a short account of his own experiments in the introduction of apospory in a barren fern, A. f.-f. unconglomeratum, and in the attempt to perpetuate, by aposporous reproduction, Moly's variegated form of Polys. angulare pulcherrimmum. The secretary's and treasurer's reports were read, the former showing that the numbers of the society had been maintained, and the latter showing that the funds were in a satisfactory and healthy condition. At the election of officers the outgoing president strongly urged that a change should be made in the holder of this office, and consequently Mr. C. T. Druery, F.L.S., was elected as the new president. Some changes were also made in the constitution of the committee. A paper was read by Mr. Atkinson, of Batley, on fern growing in the manufacturing towns of Yorkshire and Lancashire. The reader, after alluding feelingly to the difficulties with which the fern grower in these towns had to contend, such as fogs, smoke, and poisonous fumes from chemical works, &c., said that as a matter of course the ferns must be grown under glass. He recommended low houses with cool earthen floors and a north-western aspect, the latter being advisable in order to give a little sunshine at the close of the day. He advised a single row of hot-water pipes for the purpose of keeping out severe frost, but for no other purpose. A valuable paper was read by Mr. W. H. Phillips, of Belfast, on "Polystichum angulare proliferum, Past, Present, and Future." Mr. Phillips dealt with the history of the section, commencing from the finding of the first "proliferum" by Choule, probably somewhere in the thirties, going on to the addition of other forms by Wollaston and others, and the gradual evolution of "proliferum" into acutilobum, conspicuilobum, multilobum, divisilobum, and finally plumoso-divisolobum—the details of the origin of the last most beautiful subsection, in the hands of the late Colonel Jones and Mr. E. F. Fox, from spores given to the former by Mr. James Moly and taken from his decomposition splendens, being carefully and accurately given. Mr. Phillips illustrated his paper by about a hundred well-grown fronds from his own collection of beautiful varieties, many of them having been found wild by himself, and all accurately labelled. A paper by Mr. C. T. Druery on "Ferns as Pet Plants" was read, in the absence of the writer, by Dr. Stansfield. Mr. Druery insisted upon the importance of ferns being grown so as to display their full beauty as far as possible, and contrasted the appearance of ferns to which justice had been done with the miserable specimens often seen.

An exceedingly distinct and beautiful new form of Athyrium was exhibited by Mr. J. Edwards, of Blackley, and duly named and registered as A. f.-f. ramulosum lineare. A number of well-grown and beautiful cut fronds were exhibited by Mr. Troughton (Preston), Mr. Smithies (Manchester), and Mr. Lovelady (Haslingden). A motion made by Mr. J. Gott, of Kendal, that new ferns, named and registered by the society, should in future be figured, and prints issued to the members, gave rise to considerable discussion. The idea was generally approved in principle, and it was ultimately resolved that the committee be instructed to make inquiries as to the best methods of illustration, and to submit specimens of various processes to the next meeting.

LAW.

DAMAGE TO IMPORTED ORCHIDS.

At the Leeds Assizes, on August 5, before Mr. Justice Day and a special jury, the case of Moore v. The Great Eastern Railway Company was heard. This was an action brought to recover damages for the loss of a number of orchids alleged to have been caused by the negligence of the defendants' servants. Mr. Shepherd appeared for the plaintiff, John William Moore, a nurseryman and orchid importer of Bradford, the defendant company being represented by Mr. E. Tindal Atkinson, Q.C., and Mr. H. T. Kemp.

On November 6, 1897, thirty six boxes of orchids, which had just been landed in London from Rangoon, were delivered to the defendants for the purpose of being carried to the plaintiff at Bradford, instructions being given that the plants were to be conveyed in a box truck and despatched as soon as possible. There not being sufficient time to provide a box truck before the next goods train left Bishopsgate for Doncaster the plants were despatched in an open truck packed in straw and covered with a tarpaulin. The boxes reached Bradford about eight a.m. on Sunday, November 7, and the truck in which they were was left standing in an open yard until eight a.m. on November 8, when they were taken to the plaintiff's premises. Rain fell very heavily in Bradford on November 7, the result being that ten out of the thirty-six boxes were saturated with rain owing to the faulty condition of the tarpaulin by which they had been covered. When the ten boxes were unpacked it was discovered that all the plants in them, 2,473 in number, consisting of the species known as Cypripedium Charlesworthi and Vanda Kimballiana, were destroyed. The plants in the other twenty-six boxes were delivered generally in good condition. The plaintiff estimated his loss at 1s. per plant, or £123 13s. in all, and it was not disputed that if Mr. Moore was entitled to recover at all this sum represented the amount for which the company would be liable. The only question which the jury had to decide was whether or not the condition of the plants on delivery was due to the rain to which they had been subjected, and upon this point expert evidence was given on both sides. For the plaintiff it was said that the rain had killed the plants; for the defendants, that such a result was impossible, and that the rotten condition in which the plants were when Mr. Moore received them clearly showed that they had been damaged before reaching England. The jury found a verdict for the plaintiff for the amount claimed, and judgment was given accordingly, the learned Judge certifying for a special jury.

OBITUARY.

Mr. Adam Forsyth, who for some years, previous to his leaving England for the purpose of taking up his residence in New Zealand, occupied a foremost position amongst chrysanthemum specialists, died, we regret to learn, on June 10 from Bright's disease, in his sixty-eighth year. Under date of July 5, Mr. James Mitchell, of Oamaru, Otago, New Zealand, writes: "It is my painful duty to convey to you, and, through the Gardeners' Magazine, to the many horticulturists to whom he was known, the news of the death of Mr. Adam Forsyth, who passed away peacefully on June 10. Poor Forsyth had been failing for some time, and had really never been the same man since the death of his wife some three years ago. But none of us—that is, intimate friends—had any thought that his death was so near at hand. His condition, however, grew rapidly worse towards the end, as you may readily imagine, when I mention that he was out and about up to within a few days of his death, though really unable to do anything. He was suffering from an acute form of Bright's disease, and was fully aware that recovery was hopeless, and that death might supervene at any time. We laid his mortul remains in their last resting place on Sunday, June 12, in the pretty little Oamaru Cemetery, and that he was held in high esteem amongst the gardening fraternity was shown by the fact that everyone connected with horticulture, however remotely, was present at the funeral. I enclose you a paragraph from the *Oamaru Mail* reporting a meeting of the committee of the North Otago Horticultural Society, at which a resolution on the subject was passed. Mr. George Brownlee (seedsman) and myself are the executors under his will, but I do not think our duties will be very onerous." Mr. Adam Forsyth, who was a native of Kelso, at an early age devoted himself to horticulture. After serving his apprenticeship, and filling positions as under gardener in some of the best gardens in Scotland, he came to England, and in due course obtained a position as head gardener, in which he specially distinguished himself. He eventually engaged in business as a nurseryman in Shacklewell Lane, and on the land being required for the purposes of a new railway, he founded the Brunswick Nursery at Stoke Newington. Here Mr. Forsyth specially distinguished himself as a cultivator of specimen chrysanthemums, and was successful in introducing several valuable incurved varieties. In 1874 he left England for New Zealand, and after being with Messrs. Law, Somner, and Co., Dunedin, he was appointed head gardener to the Hon. M. Holmes, at Awamoa, where, to quote from the *Oamaru Mail*, "he did a great deal to create a taste for floriculture."

ANSWERS TO CORRESPONDENTS

Chrysanthemums.—J. A. B., Tipton: We are afraid that after such a severe check as your plants have experienced, due to their becoming tightly root-bound ere potted into the flowering pots, you have seriously affected your chances of producing large exhibition blooms. However, you must do the best you can, and, as regards feeding and the use of manures, we must refer you to Mr. Lee's article on the subject published in our issue of July 23, p. 472. You should "take" the buds that now appear, otherwise the flowers will be too late for exhibition purposes.

Broad Windsor Beans.—A. F., Wallingford: We should like to know the reason the exhibitor you refer to had for stating that a good exhibition pod of Broad Windsor bean should contain but two beans. We have always understood that broad beans were cultivated for the sake of the seeds or beans rather than for the pod; consequently we should certainly give the preference to the specimens containing the largest number of seeds, size and quality being equal. We agree with the judge, for if horticultural exhibitions and flower shows do not tend to improve our fruits, flowers, and vegetables by selection and culture there is no really good reason for their existence.

Seedling Carnations.—F. M. K., Bridgewater: The small collection of seedling carnation blooms sent contains several very handsome fancy varieties of merit and worthy of perpetuation, providing they are free and vigorous. Not many of them appear to be of any great value for exhibition purposes, as the larger blooms are short in the calyx. The "bursters" should be discarded as soon as a good border variety of similar colour is obtained. The majority of the flowers have plenty of petals, and doubtless finer blooms could be produced by judicious thinning of the buds. Not more than five per cent. of single flowers represents a very fine strain of seed. You should make further experiments in hybridizing and the raising of seedlings now that so much success has already attended your efforts.

Failure with Strawberries.—Novice, Notts: No doubt your plants are the result of runners from unfertile plants, and this accounts for the failure. There is apparently no just reason why strawberries sometimes cease to be fertile, but it is nevertheless a fact that they do, and also that plants propagated from them do not bear fruit. Your land is not the best for strawberry culture, but, of course, much may be done to improve it by manuring; farmyard and stable manure are the best if obtainable; pig manure is very strong. Clear out all the unfruitful plants and burn them, and do not take any layers from them before so doing. Procure rooted layers as early as possible from some nurseryman or grower who has a high reputation that he will be careful to sustain, and plant these as quickly as you can, watering and tending the plants carefully till established. By this plan you will not lose a season's crop, and it will be cheaper to obtain rooted layers than plants in pots at a later date. Shade may be necessary for a few days after planting, but as your beds are narrow a few hurdles would provide this.

Names af Plants.—J. T., Birkenhead: 1, Cratægus nigra; 6, send again.

W. W., Farnworth: No, at least not the Irish Shamrock, which is Trifolium repens. The specimen sent is Oxalis acetosella, often passing in England as the Shamrock.

L. B., Bedford: Acanthus longifolius, perennial.

H. W., Pontefract: 1, Anthemis Biebersteiniana; 2, Veronica virginica.

A. R., Feltham: 1, Erigeron speciosum; 2, Œnothera Whitneyi; 3, Spiræa Bumalda.

R. Y. F., Bristol: 1, Pavia macrostachya; 2, Amorpha canescens; 3, Olearia Haasti.

C. G., Brentwood: 1, Montbretia crocosmæflora; 2, Zygadenus bracteatus; 3, Rhodochiton volubile; 4, Rochea falcata; 5, Rhodanthe Manglesi.

MARKETS.

Covent Garden.

There are fair supplies of fruit and vegetables and the demand is brisk. Green vegetables are good and sell readily; peas are rather dear, but since the rain there has been a better demand for potatos. The cut flower trade is moderate. Home-grown tomatos are now plentiful.

Fruit.—Cherries, 4s. 6d. to 10s. 6d. per half-sieve; English grapes, 1s. to 2s.; Jersey, 9d. to 1s. 6d. per lb.; black currants, 5s. to 6s. 6d.; red, 4s. to 5s.; gooseberries, 2s. to 3s. per half-sieve; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 4s. 6d. each; English peaches, 1s. to 5s.; green figs, 9d. to 1s. 6d. per dozen; greengages, 9d. to 1s. per box, 4s. to 6s. per half-sieve; French plums, 1s. 6d. to 3s. per case, 2s. 6d. to 3s. 6d. per half-sieve; French pears, 3s. to 5s. per case; Spanish melons, 8s. to 12s. per case; raspberries, 3s. 6d. to 6s. per dozen punnets.

Flowers.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 2s. to 5s.; red roses, 6d. to 1s.; cattleyas, 5s. to 8s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; asters, 2s. to 12s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; Pansies, 1s. to 2s.; pelargoniums (scarlet), 3s. to 5s. per dozen bunches; stephanotis, 1s. to 2s.; lily of the valley, 6d. to 1s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

Vegetables.—English tomatos, 4d. to 5d.; Jersey, 3d. per lb.; Spanish, 9d. to 1s. 2d. per box; mushrooms, 6s. to 9s. per 12 lbs.; celery, 12s. to 18s. per dozen rolls; endive, 1s. to 1s. 4d.; cauliflowers, 1s. 6d. to 2s. 6d.; cucumbers, 1s. to 3s. 6d. per dozen; cabbages, 3s. 6d. to 4s. 6d.; beetroots, 2s. 6d. to 3s. per tally; mint, 1s. 9d. to 2s. 3d.; parsley, 2s. to 2s. 6d.; carrots, 3s. to 3s. 6d.; turnips, 3s. 6d. to 4s. per dozen bunches; English onions, 2s. to 3s. per dozen bunches; ports, 5s. 6d. to 6s. 6d. per case; peas, 1s. 6d. to 2s. 6d. per bushel, 2s. 6d. to 4s. 6d. per bag; French beans, 3s. 6d. to 4s. 6d. per half-sieve, 2s. 6d. to 3s. 6d. per flat; leeks, 1s. 6d. to 2s. per dozen bunches; potatos, 60s. to 120s. per ton.

Borough Potato Market.

Supplies are not quite so heavy after the rain, and this, coupled with a better demand has had a tendency to raise prices. English Snowdrops, White Beauties, and Early Puritan, 3s. 6d. to 4s.; Beauty of Hebron, 3s.; and Sutton's Early Regent, 3s. 6d. to 4s. 6d. per cwt.

The mean reading of the Barometer during the week at Greenwich was 29·816 inches, and that of the Thermometer 63°·8, the latter being 1°·5 above the week's average in the 50 years 1841—90. The direction of the wind was westerly, the horizontal movement of the air being 37 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 58·4 hours. The measured rainfall amounted to 0·06 of an inch.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.
To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.
Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

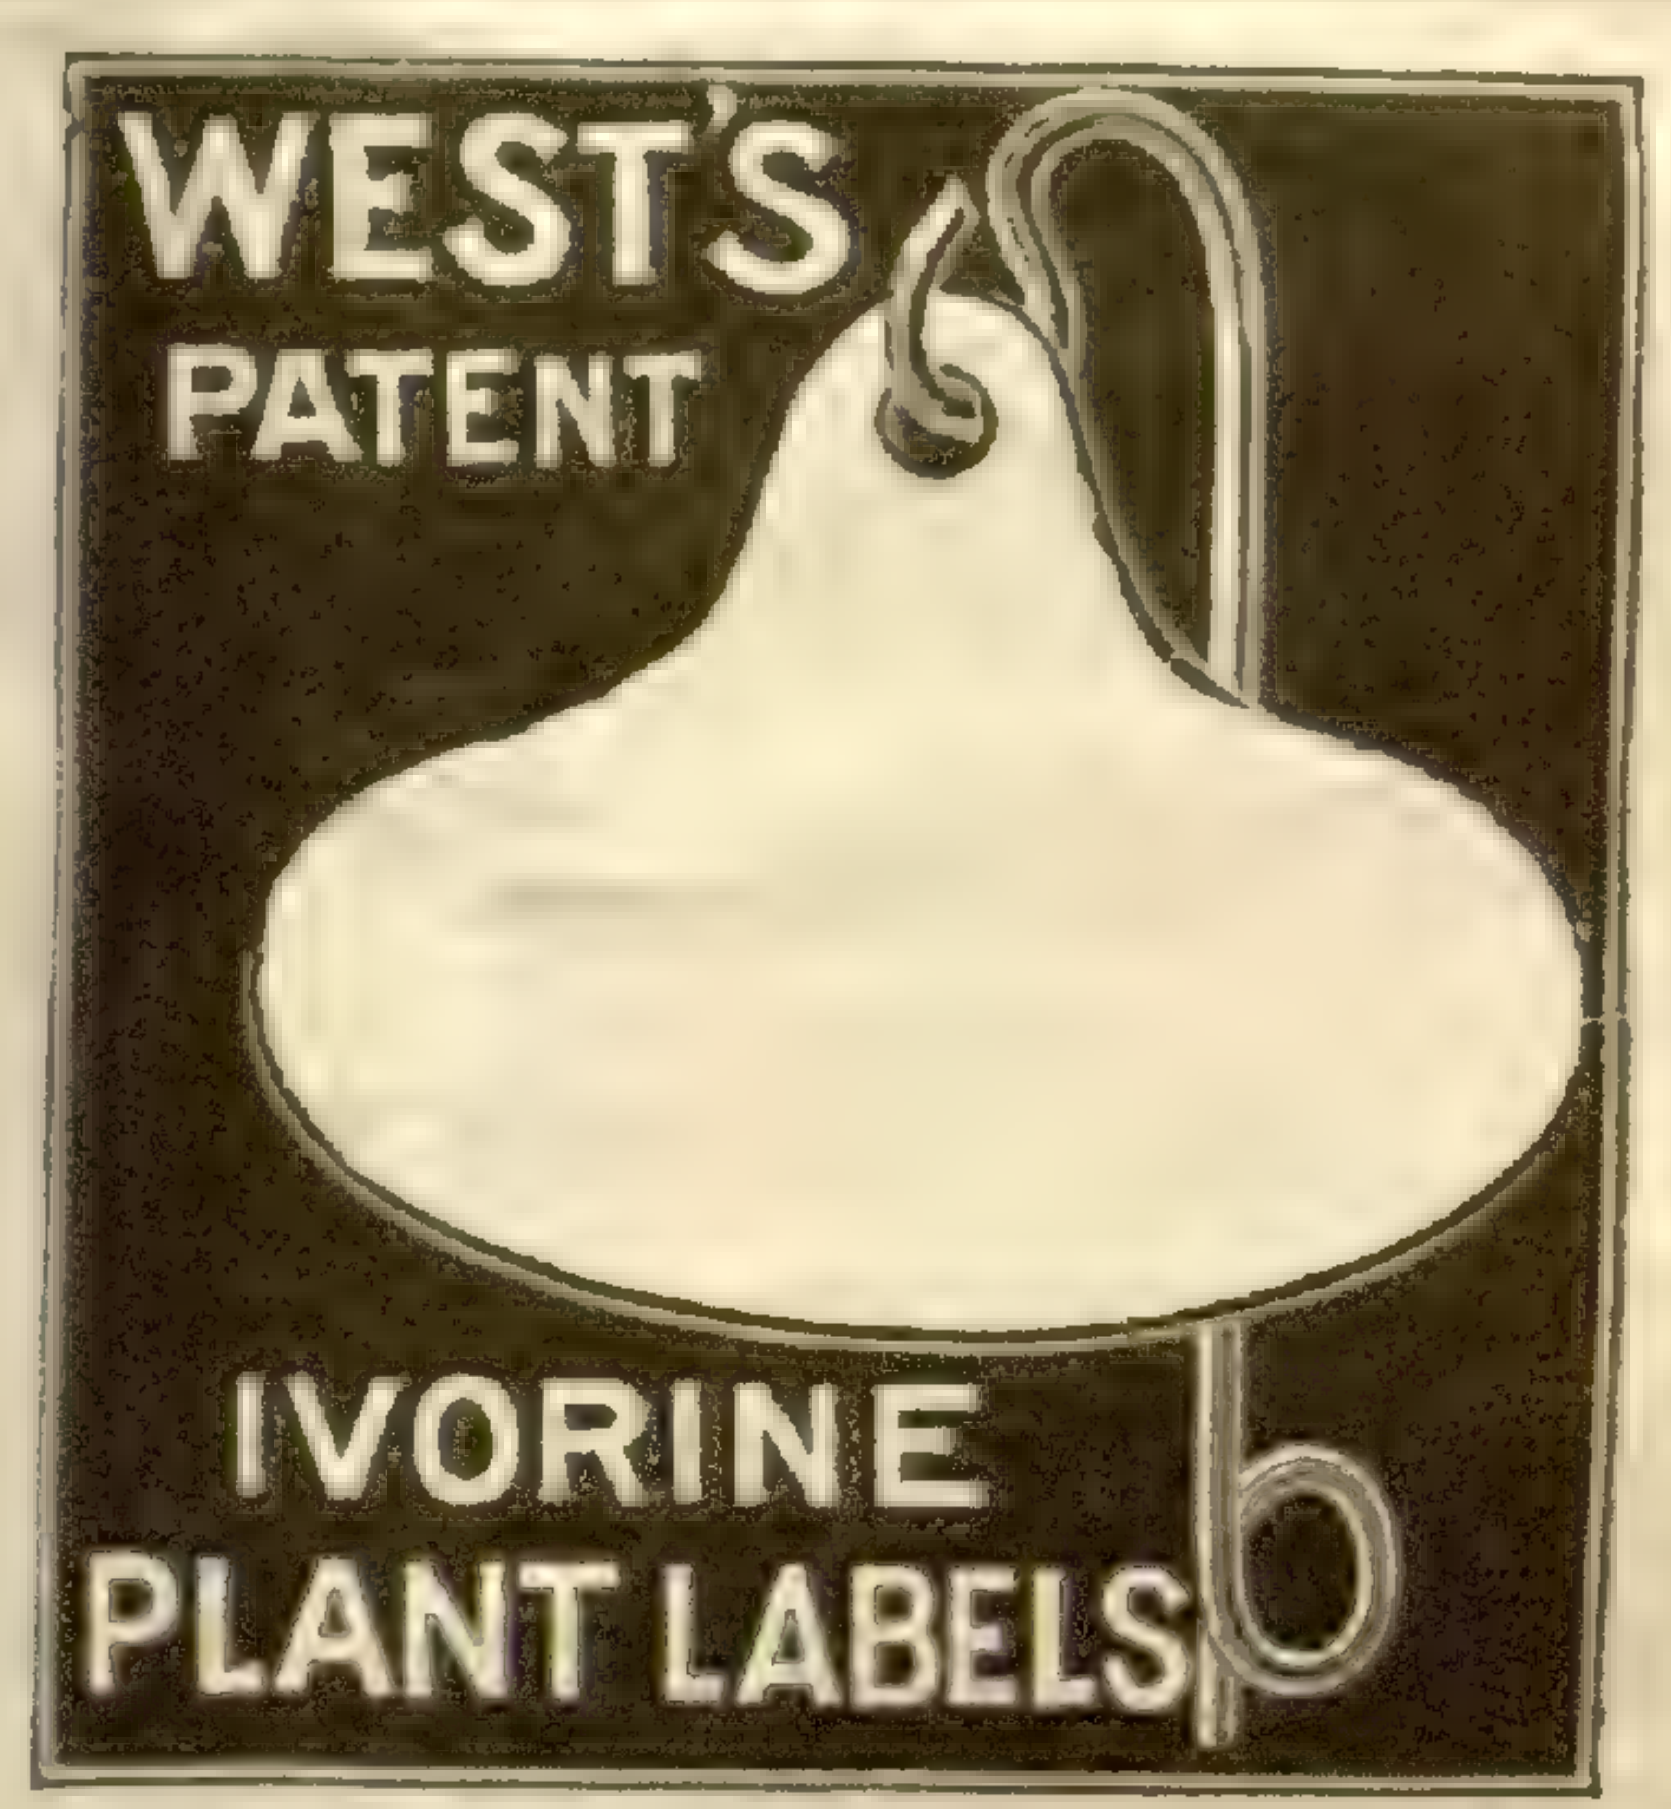
STRATFORD, LONDON, E.



THE "IVORINE" WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

By order of all Booksellers.

OFFICES—, AVE MARIA LANE, LONDON.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for [illegible] full specifications. Wherever you buy insist on [illegible] a full and complete specification of what you are going [illegible]. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper [illegible], because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more [illegible] (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. [illegible] end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	53/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

[illegible] ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison :—

£3/10/0 buys elsewhere 8 X 5 lightest possible make.

£3/12/6 buys from us 10 X 8 extra substantial make.

All sizes are in proportion. Need we say more.

Speculate in a sample end, and set your doubts at rest.

To hold.	Size.	Lean-to	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.

4 X 3	8/9
6 X 4	14/6
8 X 6	22 6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

Apply for List to—

HYPOLITE, DEPTFORD.

EPPS'S selected PEAT.

A SPECIALLY good stock now on hand of ORCHID PEAT in good condition; also for Stove, [illegible], and Hardwood Plants, Rhododendrons, &c., in [illegible] quantities. Rich Fibrous Loam, Silver Sand, [illegible], C. N. Fibre, Sphagnum Moss, Charcoal, &c. [illegible] cheap through rates to all parts.

EPPS AND CO.,

THE PEAT DEPOT, RINGWOOD.

PROTECT YOUR GARDENS.—Garden Netting, [illegible] and dressed. Will not rot if left out in all [illegible], [illegible] yards by 1 yard, 3s.; 100 yards by 2 yards, 6s.; [illegible] 3 yards, 9s.; or so on to any width, carriage paid [illegible] over [illegible]. I DO NOT REQUIRE PAYMENT TILL YOU HAVE RECEIVED AND APPROVED OF THE NETTING.

WM. PAUL AND SON

BEG respectfully to call attention to their large and varied Stock of the above, which are unsurpassed in quality, and will be found most reasonable in price. White Roman Hyacinths, Early Narcissus, Freesias, and other early Bulbs can be delivered at once, and the general collection will be ready very shortly. [illegible] descriptive Catalogue post free on application.

☞ Wm. Paul and Son's Exhibition of Hyacinths in pots in March last received the Highest Awards of the day at the Spring Show of the Royal Botanic Society, and at the second March meeting of the Royal Horticultural Society.

The *Gardeners' Magazine* of 2nd April, 1898, in describing them, says: "A big regiment of stalwart hyacinths from Messrs. W. Paul and Son, Waltham Cross, secured a large share of the general admiration. The specimens staged were equally remarkable for their short, stout foliage and massive spikes." And other Press notices, too numerous to mention, are equally favourable.

NOTES OF THE WEEK.

WATERING FRUIT TREES.

WITH so small a rainfall as that recorded during the past six or seven weeks there can be no doubt that fruit trees trained to walls have in some parts of England suffered somewhat from an insufficiency of moisture at the roots at a period when a great strain is imposed upon them in providing the nutrient matter required in building up the new growth and the development of the fruits. We have had many seasons in which fruit trees growing under the conditions mentioned have been subjected to a greater degree of suffering from drought than has been the case this season, for not only have we had droughts extending over a longer period, but the trees have in some dry seasons been more heavily laden with fruit. There is not the slightest necessity for alarm as to the ultimate results of the conditions that have obtained; but in numerous instances that have come under our notice the trees have evinced signs of distress, and this appears an opportune time for considering whether something might not be done to assist the trees to pass through comparatively short periods of dry weather without an appreciable check. Wall trees growing in gardens of which the soil is naturally light have, as will be readily understood, suffered the most, and the trees we now have in mind are those which by reason of the lightness of the soil feel the effects of drought the most quickly. Where the trees have appreciably suffered from the cause in question they would derive substantial assistance at the present time from a liberal watering. To supply any considerable number of trees at one time with enough water to moisten the soil to a sufficient depth is an arduous undertaking when the fluid has to be carried long distances. Because of this it must not be assumed that no help can be given, for by watering a few each day all the more important peach and nectarine trees can receive assistance within a short time, and without the garden staff being unduly taxed. This aid should be forthcoming whether the crop has been gathered or not, for the additional moisture placed within reach of the roots will greatly aid the trees in completing their season's growth, and thus lay the foundation of a good crop for next year. Reliance must not be wholly placed upon waterings, and it would be an enormous advantage were mulchings of short stable manure more generally used in the cultivation of wall fruits on sandy and other soils that rapidly part with moisture. To over estimate their value would be extremely difficult, for when the borders are covered in May with a layer of stable manure from four to six inches in depth evaporation is materially checked during the summer, and as the manure decays and becomes, through the agency of earthworms, incorporated with the soil, the capacity of the latter for retaining moisture is greatly increased. Stable manure has great hygroscopic power, as proved by the fact that when in a dry state it will absorb from the atmosphere and retain moisture equal to forty per cent. of its weight. Discretion is, of course, necessary, and it should be borne in mind that while the liberal use of stable manure to strong, retentive soils may promote excessive luxuriance, yet, in soils deficient in humus, its use in the form suggested will be highly beneficial.

THE ROYAL BOTANIC SOCIETY'S PROSPECTS.

IN one important respect the proceedings at the annual meeting of the Royal Botanic Society were hardly so satisfactory as could have been desired, inasmuch as but little was said with reference to the prospects of the society or the steps it is proposed to take with a view to place it in a position to carry on its work in a vigorous manner. It is pleasant to learn that there had been an increase in the number of Fellows and in the income from subscriptions; and also that there was a small balance at the close of the financial year in favour of the society. There are now 2,050 Fellows on the books, and of this number 167 joined during the year, or 36 in excess of the previous year, and 83 above the average of the past ten years. These figures are of interest as indicating the vitality of the society, and its possibilities under vigorous management carefully adapted to present day requirements. With an income of nearly £3,000 and so substantial a list of Fellows there should be no great difficulty in preparing a programme for next year that would result in the society accomplishing much useful work and obtaining still larger accessions of new Fellows. The School of Practical Gardening has, it was stated, been successful, and this so far is satisfactory; but we do not look to this school or to the holding of dog shows in the gardens as the means of restoring the society to prosperity. We, indeed, fail to see how, under existing conditions, the students attending the school can be thoroughly grounded in the practical details of the culture of hardy fruits and vegetables, and we are unable to recognise a very close relationship between botanical science and pet dogs. There was one matter which we regard with some pleasure, and that was the statement by Mr. C. Brinsley Marlay, who presided at the meeting, to the effect that he should like to see relations existing between the society and the kindred association at Westminster, which would permit of the latter's fortnightly meetings being held in the Regent's Park garden. It is something to have this admission of the desirability of these two great societies working together, and it is especially gratifying to us as a proof that our suggestions as to the advantages that would result from the combination of the forces of the two bodies is slowly but surely bearing fruit. It would, of course, be an advantage to the visitors were the magnificent and interesting collections that are sent to the Drill Hall to be arrayed in the spacious conservatory of the Regent's Park gardens; but it is not to be expected that the Royal Horticultural Society will do anything so unwise as to take steps that will result in its most important work being partly obscured. A much closer relationship than was suggested by Mr. Brinsley Marlay is, in the interest of botany and horticulture, required; and we consider the complete fusion of these societies essential to horticulture attaining to a position commensurate with its importance in the metropolis. The great need at the present time in London is one powerful general society with a spacious and attractive garden, which would admit of the several special societies holding their annual gatherings in it with advantage to all concerned, and be regarded both at home and abroad as the head-quarters of practical and scientific horticulture in the United Kingdom.

A CURIOUS HART'S-TONGUE.

AT the meeting of the Royal Horticultural Society's Scientific Committee on the 9th inst., Mr. W. Marshall exhibited a very curious example of multiform variation in a plant of Scolopendrium vulgare; no less than three distinct and widely divergent forms presented themselves as originating from one and the same axis of growth. The history of the plant involved also great peculiarities, since in the first place it originated from a ramo-cristate variety, in which the fronds ramify repeatedly into a fanshaped arrangement of very narrow segments, which are profusely fertile, often on both surfaces. A frond of this when layered developed five bulbils on the edges, and the plant in question was developed from one of them, so that no question of crossing comes in at this stage to justify any reference to multiple parentage as conducive to a multiform result. The plant was at first of the parental form, but subsequently reverted to the normal in appearance, though obviously retaining in its blood or sap equivalent a great capacity for sporting since in the form it has assumed now one frond is absolutely normal, that is, flat, strap-shaped and bluntly pointed, with a heart-shaped base. Three other fronds start with normal bases, but bear foliose branching crests, while still another frond is of a true crispum or frilled form, with a digitate tip. None of the fronds, therefore, are of the parental narrow ramo-cristate type, and though the crested ones and the normal one may be regarded in some measure as legitimate reversions, the occurrence of the plumose or crispum frond in such a connexion is one of the very last things the experienced fernist would expect. Its departure from the original type is really an extreme case, seeing that a narrow, much divided, very fertile frond is replaced by a broad, frilled, barren one, belonging to a different section altogether. The occurrence of such a multiform plant independently of a cross, is another proof of the versatility of species in themselves, and undermines materially the evidence which has been adduced of multiple parentage in multiform plants of a similar class. As the hart's-tongue is easy to raise from the frond bases, it would form a very interesting experiment to mark these diverse fronds, and take cuttings from them to ascertain whether such a start being once initiated by the frond itself as it were, its base would reproduce its own particular type to the exclusion of the other. Some well marked and constant varieties of ferns have been so intimately associated with normal plants when found as to indicate the possibility of their resulting from bud sports instead of spores, and we know of one case of a heavily crested, frilled hart's-tongue originating as an undoubted offset from a plain frilled one, from which it could only be separated by cutting. Any evidence, therefore, of such potency in local partial sports to become fixed as established varieties is well worthy of collection, our knowledge in this direction being of the most meagre description.

FRUIT HYBRIDIZING.

THE unsatisfactory results so far attained by the attempts to cross fruits of different species are not much to be wondered at when we consider the far greater complexity involved in a successful fruit cross than there is in a merely floral combination. The bigeneric orchids recently produced, and cited as exemplifying possibilities in this direction, have resulted from crosses between plants which even if of varietal forms, are practically wild finds, and hence have fairly pure blood in each parental form to start with, and, moreover, the external appearance of the bi-typical flowers, if they present new forms or new tints, is held to justify all the trouble taken. With fruits, however, there is the far more subtle question of flavour to be considered in addition to the second material point that the parental forms of raspberry or strawberry, gooseberry or currant, are the outcome of long-continued selective culture, so that, as opposed to the case of orchids, whose seed would presumably give fairly true progeny, the seeds of these fruits are of such variable potencies that little or no dependence can be placed upon them as reliable reproductive agents. The results of this is that the fruit hybridist has really no fair start, and when we consider what an exceedingly delicate matter flavour is, especially in our finer fruits, and how it requires a connoisseur to fully appreciate their niceties, grading not merely from the pleasantly acid to the intensely sweet, but all grades mingled with the specially characteristic taste and aroma of the variety concerned, it becomes clear that any combination is almost bound to spoil rather than to improve, and the connoisseur shudders at the mixture precisely as the judge of wine would do at a mingling in one glass of his choicest vintages. In crossing and hybridizing, however, it occasionally happens that the influence of one parent is peculiarly limited, only one feature out of the many being transmitted, and in this fact lies, in our opinion, the greatest encouragement for the hybridizer of fruits, since among a multitude of failures due to mixed, and therefore unpalatable, flavours, he may here and there arrive at a type worth having, say, bunch gooseberries with the true gooseberry flavour, or currants immensely enlarged by the gooseberry influence, but with their characteristic taste unimpaired. This type of combination is well worth trying for, and though we predict that the successes will be numerically few, we heartily hope that the efforts to reap them will not be relaxed on account of preliminary difficulties, especially as Nature has a peculiar knack of introducing surprises in the varietal line by way of bonus to the assiduous cultivator over and above the legitimate prizes arrived at and won by judicious unions.

Checkmating the Black Currant Mite.—As yet but little has been accomplished in obtaining a more thorough knowledge of the life history of the Black Currant Mite (*Phytoptus ribi*), or in devising an effectual means of checking its ravages. As the result of the several scientific bodies leaving the pest severely alone, and the failure of the growers to combine for the purpose of conducting a series of experiments with a view to devising some means of warding off attacks, the mite continues to extend and inflict heavy losses upon cultivators. So far we have not passed far beyond picking off infested buds and cutting away branches of which the greater number of buds indicate the presence of the mite; but both methods of procedure are tedious and involve a considerable expenditure in labour, and there is no good reason why the efforts made for the purpose of repelling the attacks should be limited to them. In the large plantations of black currants grown for fruit production by Messrs. T. Rivers and Son at Sawbridgeworth, the mite has been effectually checkmated by the simple process of cutting the branches back to within a few inches of the base every second year. The first year after they have been thus severely pruned they produce stout growths ranging from eighteen to thirty inches in length, and in the second season they produce heavy crops of fruit of high quality. These branches are cut down during the winter following the production of fruit, and every scrap of wood is gathered up and burnt. Under this course of procedure, one crop only is obtained from each plantation in two years; but by cutting back one-half the bushes each year, a continuous supply of fruit is obtained. The question, therefore, which the grower has to consider is whether half an acre of healthy bushes will be more profitable than an acre of bushes in a more or less unsatisfactory condition from mite infestation. Mr. T. F. Rivers, the head of the Sawbridgeworth firm, who is one of our highest authorities on the culture of fruit for market, as well as on fruits for the garden, is strongly of the opinion that the smaller area of perfectly healthy bushes give the best results, and that he has the courage of his opinion is evidenced by his practice. It would be interesting to know the exact difference annually in the weight of fruit obtained from the two areas mentioned, and we commend the matter to the attention of those who have an experimental turn of mind; but we do not suggest that the mite should be introduced to the plantations for experimental purposes.

Hybrid Nymphæas.—Dr. Masters exhibited several kinds of nymphæas at the recent meeting of the Scientific Committee, with the purpose of calling attention to the different arrangements and number of the lacunæ in the stems and the flowers and in the petioles. He observed that the species could be grouped by means of them, and proposed to make a further examination of the hybrids for the purpose of ascertaining whether they could also be arranged into groups by the aid of the lacunæ.

Violas at Chiswick.—The trial of violas in the Chiswick gardens of the Royal Horticultural Society has, notwithstanding the somewhat unfavourable climatic conditions that have obtained during the summer, brought into prominence the varieties specially suitable for garden decoration. The large collection has been examined on several occasions during the season, and three marks or awards of merit given to the finest of the varieties in the several hues of colour. These have been fully reported upon in the GARDENERS' MAGAZINE, and it is of interest to know that the varieties selected for distinction at the earlier meetings of the Floral Committee still maintain a leading position. At the inspection of the collection on Tuesday it could readily be seen that had the awards been made on that day they would not have differed materially from those made earlier in the season. One variety only was selected for the award of three marks, and this was Bronze Queen, which has dark, red-bronze flowers, and appears to be well able to resist the effects of drought when growing in light soils. It is fairly free in flowering.

Function of Iron in Plant Life.—At a recent meeting of the Paris Academy of Science, M. Jules Stoklasa submitted his views on the physiological function of iron in the vegetable organism, which created considerable interest. It has long been recognised that iron is necessary for vegetable life, and microscopic observations have led to the supposition that the metal exists in organic combination in the nucleus of the cell. It is not present in chlorophyll. M. Stoklasa has extracted from onions and from peas a substance containing 1·68 per cent. of iron, which closely resembles, in composition and properties, the hermatogen obtained by Bunge from yolk of egg. This compound is also contained in non-chlorophyllaceous plants, as was proved by its being obtained from moulds (*Mucor mucedo*) and fungi (*Boletus edulis*).

Blind Strawberry Plants.—Some plants of Royal Sovereign strawberry were received at the meeting of R.H.S. Scientific Committee from Mr. J. Lyne, of the Gardens, Foxbury, Chislehurst, in which the crowns were generally blind. Mr. Lyne writes: "Last autumn we planted a bed of last season's runners, with the object of getting early runners this year. They grew well, and made a fine lot of early runners. All trusses of bloom were picked off the parent plants as soon as they appeared. The runners were layered four in a six-inch pot, and all rooted well; but last week, when transferring them into single pots, we found about half were blind, the crowns being brown within. A healthy plant would be often growing in the same pot with defective ones." Perhaps some growers of strawberries may have had a similar experience, and can throw some light on the mystery. Sections of the crown buds revealed no visible fungi nor insects, but the scales were turning brown from the exterior part inwards, apparently suggestive of an external source of the mischief.

Royal Botanic Society's Garden.—Mr. C. Brinsley Marlay writes: At the annual meeting of the Royal Botanic Society, at which I took the chair, there was one aspect of the society I could not dwell on as I should have wished, and yet it is one of some importance. When the gardens of the society were first formed, not only were they intended to promote horticulture and the study of botany, but also to protect a spot in the centre of London where some of the [illegible] features of Nature might remain untouched, plants common in the country, but rare in London, might still find a home, and birds nest there undisturbed. To many, too, the sense of quiet and repose which the gardens gave was delightful—a feeling of rest which only the country can give. It was for these reasons that the Fellows reserved to themselves the right not to admit the public indiscriminately; that, like the squares, a character of privacy was maintained, though it was never difficult for quiet people to obtain admission, or any serious student of Nature. This spirit of exclusiveness is not now maintained, and the gardens are as much open to the general public as is possible, if they do not altogether lose the original intention with which they were formed, and the natural beauty, which they still possess, does not disappear. To turn them into an inferior Ranelagh, or a bad imitation of the Palmen Garten in Frankfurt, would probably [illegible] failure, and take away one of the few places where the tired man of business, the invalid, and the old may find a few moments of repose, a few [illegible] of quiet, away from the noise of the crowded street, the cyclist, and the omnibus.

who like crowds have every opportunity of enjoying themselves in London, but those who would fain be a moment at rest hardly know where to go. Burke says "Conversation enriches the mind, but solitude is the school of genius." Every day, before the ruthless builder, tranquil spots and relics of the past disappear. The few which it is possible to preserve become every day of greater value. Let not a spirit of expediency or the greed of money be able to annihilate all "places of historic interest or of natural beauty."

Tomatos with Supernumerary Carpels were submitted by Dr. Bonavia to R.H.S. Scientific Committee. Two specimens were sent—one, consisting of four carpels, which, instead of being coherent to form a single fruit, were only united at the base, and therefore nearly apocarpous. The other had several extra carpels issuing out of the centre above. These formed a whorl of carpels, in addition to the normal series. It resembled the Mellarose Orange in this respect.

Dwarf Snapdragons.—It is evident, from what may be seen by those who have opportunities for making observations in any considerable number of gardens, that a section of the horticultural community regard dwarfness in ornamental plants as great merit. Hence we have strains of antirrhinums so dwarf that the flower spikes have a difficulty in rising an inch or so above the leafage which forms a carpet on the surface of the ground an inch or two in thickness. In like manner we have strains of asters so dwarf that the flowers almost rest upon the soil, and suggest the idea that they had been dibbled into the bed. What the advantages of this excessive dwarfing are we have yet to learn, and, failing to recognise them, we cannot understand minds so constituted as to show an appreciation of plants devoid of a single atom of grace or beauty. We can, of course, appreciate the value of dwarf forms of tall-growing plants in which their general characteristics are retained, although necessarily in a lessened degree; but we fail to recognise any in plants from which every characteristic feature has been completely obliterated. This season collections of the dwarf-growing snapdragons have been grown for trial in the gardens of the Royal Horticultural Society at Chiswick and we are pleased to know that excessive dwarfing did not obtain much encouragement from the members of the Floral Committee, by whom they were examined on Tuesday last.

Vegetation of Lord Howe Island.—Mr. J. H. Maiden visited Lord Howe Island in H.M.C.S. "Thetis" in March and April last, spending nine days on the island. Hemsley's Flora of the island (*Annals of Botany*, x. p. 221, June, 1896) records two hundred and six plants and three introduced ones, total two hundred and nine. Mr. Maiden has added sixteen species and one named variety to the indigenous flora, and seventeen species of introduced plants, while he has removed five species of supposed indigenous plants from Hemsley's list. So that, according to Mr. Maiden, the flora of Lord Howe Island stands at present at two hundred and seventeen indigenous species (being a net addition of eleven), and ten introduced ones.

Tomato with Red and Yellow Fruit.—Mr. J. McLean, Luttrellstown, Clonsilla, co. Dublin, sent to R.H.S. Scientific Committee some golden yellow fruit, with the following observations: "The plant which produced them is one out of one hundred and forty-five Frogmore (red) Selected. The first cluster produced the true red sort, but on the same plant three trusses consisted of yellow fruit, as sent." Professor Bailey observed that he had raised yellow-fruited tomatos from the seed of red-fruited plants, but had not seen a case resembling the present one, in America, though he had known a cutting of a red-fruited sort to bear yellow fruit; and Mr. George Gordon remarked that he had frequently seen red fruits striped with yellow.

Crassulaceous Hybrid.—Mr. Veitch submitted to R.H.S. Scientific Committee trusses of flowers of a new hybrid, raised by Mr. Seden, between Kalosanthes coccinea (female) and Rochea falcata (male). The flowers of the hybrid were small, as in the female parent, but the colour approached that of the male. In many points it was intermediate between the two parents.

The National Co-operative Festival held at the Crystal Palace, Sydenham, during the present week was opened successfully on Tuesday, August 16, when a large and influential gathering of co-operators met to consider educational and labour questions. To us and our readers one of the most interesting features in connection with this wonderful festival is the flower show of two days' duration held on Friday and Saturday, August 19 and 20. We are informed, as we go to press, that the exhibits from professional gardeners are [illegible] more numerous than usual while the quality is likely to be as high as ever in spite of an untoward season. Of the amateurs' and cottagers' displays of fruit, flowers, and vegetables we cannot say more now than that the entries are so numerous they will tax all Mr. Waugh's resources for the provision of ample space. In this section of the exhibition the competitors do not stage their exhibits until Saturday morning. In our next issue we hope to note the principal features of the Co-operative flower show.

Use of Vegetables in Bacteriological Investigations.—The culture of bacteria has been successfully accomplished on almost all vegetables, but the potato and the carrot are those chiefly used. Mr. Roger has, however, reported to the Paris Society of Biology that, in his opinion, the Globe artichoke possesses several advantageous qualities in this respect. Nothing is more simple than to prepare it for the purpose. After having stripped off the [illegible] the thick part is cut up into little cubes, care being taken to preserve the [illegible] (*skin*). The pieces are placed in tubes plugged with damp wadding, the [illegible] being uppermost, so that the culture medium is represented by a fleshy [illegible] surmounted by a sort of tuft. When the wadding is inserted, the whole is [illegible] in an oven to 115 degrees C. for a quarter of an hour. In making the inoculation, the germs must be deposited at the point of insertion of the fibres.

The Common Pampas Grass known in gardens as Gynerium argenteum has, as our readers are already aware, been re-christened Cortaderia argentea by Dr. Stapf, of Kew, and it is stated to be a native of the Cordillera and not of the Pampas. An allied species named C. jubata, from the Andes of Ecuador is figured in the the current issue of the *Bot. Mag.* t. 7607; it flowered in Mr. Gumbleton's garden at Belgrove, Co. Cork in 1895 and is described as even more beautiful than C. argentea and having a pale lavender tinted plume; it is not hardy at Belgrove. In the same issue an illustration of Tchihatchewia isatidea, a dwarf, rosy flowered crucifer from Armenia; Buddleia variabilis, described in the Gardeners' Magazine on page 488; Ledum glandulosum, a Californian shrub with spiciform racemes of pure white flowers; and Ribes villosum, a bright yellow flowered shrub from Chili, perfectly hardy at Kew and retaining its foliage during ordinary winters.

Admixture of Artificial Manures.—The risks attendant upon the admixture of certain combinations of the fertilising elements—nitrogen and potash—are strikingly exemplified by the results of some experiments carried out by Professor Goessmann, and referred to by Dr. Aikman in the *Agricultural Gazette.* In the course of these experiments it was found that mixtures of the two manurial ingredients, nitrogen and potash, in the form of muriate of potash and sulphate of ammonia, invariably gave much lower results than mixtures containing sulphate of potash and sulphate of ammonia. Since the experiments were carried out under exactly similar conditions, as to character of soil and general mode of cultivation, it was concluded by the investigator that the mixture of muriate of potash and sulphate of ammonia suffered some unfavourable change when incorporated with the soil. To ascertain, if possible, the explanation of this unfavourable action of the mixture some of the dry mixture of muriate of potash and sulphate of ammonia was dissolved in water, when it was found that the muriate of potash was converted into sulphate of potash; while the sulphate of ammonia was changed into chloride (or muriate) of ammonia (sal ammoniac). Sal ammoniac, it is well known, exercises a most unfavourable action on growing plants. It is well to bear in mind, therefore, that on no account should these two substances be mixed together in a manure.

Fertilisers for Grass Lands.—Some experiments in the use of artificial and natural manures have been carried out by Mr. J. McCreath on behalf of the Cornwall County Council, and the report on the results is of much interest. In the experiments on grass land basic slag gave excellent results, as in the preceding seasons, yielding the largest profits. Bone meal applied in equal quantity, namely, three hundredweight per acre, produced a better bottom growth, but at greater cost. Superphosphate of lime used by itself improved the quality of the pasture and left a small profit, but the results were better when used in combination with one hundredweight of nitrate of soda. Kainit gave unsatisfactory results, and sulphate of ammonia and nitrate of soda used alone, injured the quality of the herbage, except where the pasture was grazed. Twenty loads per acre of fresh farmyard manure produced the heaviest crops, while rotted manure gave only half as much produce.

New Public Park, Widnes.—The first prize of thirty-five guineas in the public competition for the best design for laying out the Appleton House estate as a public park has been awarded to Messrs. W. Barron and Sons, Elvaston Nurseries, Borrowash. The area of the park is about thirty-six acres, and in addition to the general plan of the park, which contains a lake, cricket and recreation grounds, lawn tennis grounds, bowling green, gymnasiums, &c., they also furnish three alternative plans for dealing with Appleton House and premises, also designs for entrance gates, band stands, shelter, fountain, &c.

Poppy-head, with Pistillody of the Stamens.—At the recent meeting of the Royal Horticultural Society's Scientific Committee, Herr J. K. Budde exhibited a fruit of Papaver somniferum, with a complete whorl of miniature heads around the base; these being metamorphosed stamens. This peculiarity is well known; but it is interesting to hear that Professor de Vries has succeeded in fixing it by selection, so that this monstrosity now comes true from seed. A similar phenomenon is common among wallflowers. With reference to hereditary monstrosities, Professor Bailey observed that a species of echinops, with a fasciated and twisted stem, as also the spirally twisted variety of the Fuller's Teazle, can be now perpetuated by seed. Mr. Henslow inquired if the weeping ash was known to be perpetuated by seed, as of thousands of seedlings in his garden at Ealing, none ever showed any inclination to weep; though the late Professor J. S. Henslow found a slight tendency to weep to exist for two or three years in his experiments at Hitcham; but the plants grew erect afterwards. Mr. Wilks observed, on the other hand, that a young tree a few years old in his garden at Shirley had begun to show a tendency to weep.

Hardy Nymphæas at Gunnersbury House. — Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, sends us a list of the beautiful hardy water lilies growing in the pretty lake at that establishment. This will prove interesting now that water gardening is becoming popular. The kinds are: N. Aurora, N. tuberosa, N. alba, N. Ellisiana, N. albo-rosea, N. gloriosa, N. pygmæa helveola, N. Seignouretti, N. lucida, N. Robinsoni, N. odorata, N. o. roseacea, N. o. rubra, N. o. sulphurea grandiflora, N. Leydekeri fulgens, N. Leydekeri rosea, N. Marliacea chromatella, N. M. carnea, N. M. rosea, N. M. albida, and N. M. rubro-punctata.

Mr. Thomas Humphreys, well known to a large circle of horticulturists as Assistant Superintendent of the Royal Horticultural Society's Gardens, at Chiswick, a position he has creditably held during the past five and a-half years, has now quite recovered from a painful illness resulting from an accident on the cricket field. He resumed his duties at Chiswick last week and was at his usual post of secretary to the Royal Horticultural Society Floral Committe, at the Drill Hall on Tuesday, the 9th inst. Many old Kewites and distant friends of Mr. Humphreys will be glad to hear of his complete restoration to health and strength.

EXHIBITIONS AND MEETINGS.

SHREWSBURY FLORAL FETE.

THE twenty-fourth annual floral fête held at Shrewsbury took place in the famous Quarry Grounds on August 17 and 18, and was, from a horticultural point of view, a decided success. The quality of the exhibits throughout was good, and there was even an advance in the grape classes, which were more keenly contested than ever. Six large tents, two of these being monstrous canvas erections, only just sufficed to hold the largely increased number of exhibits—we were informed that there were four hundred more entries than last year, enough itself to make a large show. The groups and plants came in for a full share of admiration, but perhaps the floral decorations gained the fullest meed of praise, for they were exceedingly beautiful, especially the baskets and bouquets. The "dessert table" and the "garden produce" classes were great attractions, and if the latter possesses no special educational value, it, at any rate, adds another to the many attractions of the fête. All the arrangements were of the best, under the able superintendence of Messrs. Adnitt and Naunton, the co-hon. secretaries. Judging commenced at twenty minutes past ten, and soon after that time the weather became extremely hot and bright, so that by twelve o'clock, when the rank and fashion of Salop came to the show, there was a gay scene, for the ladies had all donned their lightest and brightest of summer costumes. Cottagers' exhibits were both extensive and of high quality; there were splendid onions, cabbages, lettuce, currants, and gooseberries, twenty-six collections of vegetables, asters, stocks, marigolds, dahlias, potatos, and marrows, and stands and bouquets of wild flowers. These exhibits filled one large tent.

GROUPS.

The chief award for a group of miscellaneous plants arranged to produce the best effect upon a space of three hundred square feet was secured by Mr. James Cypher, who once again put up a grand exhibit; at the back was a representation of rockwork, a rustic bridge over a pool of water in which were water lilies, and into which water dripped from the bridge; bamboos, caladiums, palms, and tall ferns were used in the background, and on either side were tall graceful specimens of Humea elegans; small mounds towards the front were composed of bright crotons, dendrobiums, Cattleya gigas, Lilium speciosum, cypripediums, oncidiums, ixoras, and Francoa ramosa; on the ground was very dark moss, with small Rex begonias dotted about it; a grand exhibit. Mr. W. Finch, Coventry, was placed second; his group contained a grand lot of liliums, Humea elegans, and Francoa ramosa; Mr. C. Roberts, gardener to Miss Wright, Helston Hall, Coventry, third, his group containing handsome and well-grown crotons, Rex begonias, Lilium auratum, &c.; the virgin cork was rather too prominent, however, to be pleasing.

Mr. J. Edmonds, gardener to the Duke of St. Albans, Notts, secured the £25 offered as first prize for a group of ornamental foliage plants, palms, ferns, &c., arranged to produce the best display on an area of three hundred square feet. The largest mound of this fine display was placed as far back as possible, and was topped by a fine kentia, with acalyphas, crotons, fittonias, alocasias, &c., surrounding its base; smaller mounds towards the front were mostly tall well-grown crotons, surrounded at the base with Rex begonias, bamboos with a base of ferns, palms with bromeliads at the base, &c.; the groundwork was of moss in two shades of green, dotted with Acalypha Macafeeana, grandly grown; Mr. J. Cypher, Cheltenham, had to be content with second place, but he had a grand exhibit, in which ferns were used with wonderful effect and taste.

In the class for a group of miscellaneous plants to occupy a space of one hundred and fifty square feet, and to contain no orchids, the president, T. F. Kynnersley, Esq., gave the first prize. The result of the competition was that Mr. T. Tugwood, gardener to the president himself, at Leighton Hall, Ironbridge, won the first prize with a bold group consisting of a central mound of palms, liliums, tuberoses, and ferns, with spans of virgin cork extending to the similarly constructed corner mounds; Mr. C. Roberts, gardener to Miss Wright, Halston Hall, Oswestry, came second; and Mr. J. Bremmell, third.

PLANTS.

A grand display of twenty stove and greenhouse plants was put up by Mr. James Cypher, Cheltenham, who, as usual, won the first prize, a silver cup valued at £25. Some of the finest specimens were Phœnocoma prolifera Barnesi, Statice profusa, Croton montifortiensis, C. Her Majesty, Allamanda nobilis, Clerodendron Balfouri, Bougainvillea Glabra, Ixora Westi, Croton Warreni, Kentia Belmoreana, and Livistonia rotundifolia. Mr. Finch, of Coventry, also competed, and the two sets made up a really marvellous display of plant culture; Mr. Finch secured a valuable special prize. Mr. T. Lambert, gardener to Lord Harlech, gained first prize for thirty stove and greenhouse plants, orchids excluded, with medium-sized and finely-grown examples of Ixora Prince of Orange, I. Williamsi, Phrynium variegatum, Heliconia illustre, Eucharis amazonica, Dracæna Reginæ, D. Baptisti, Dipladenia amabilis, Pancratium fragrans, &c. Mr. R. C. Townsend, gardener to Colonel Lloyd, came first for a collection of thirty plants, and among his set were nice plants of Cattleya gigas, Cypripedium Rothschildeanum, and some oncidiums; Mr. J. Birch, second. Mr. Myers had the best three specimen fuchsias, but was closely followed by Mr. A. Bateman, Forgate.

Exotic ferns made a good show in one of the smaller tents, but we have seen better plants than were on view; Mr. E. Jones, gardener to A. M. Barber, Esq., Wellington, had the best set of six, showing big specimens of Adiantum Farleyense, A. formosum, and other maidenhair ferns, Pteris serrulata cristata, and a large Davallia hirta cristata; Mr. T. Stevenson, Wellington, was second; and Mr. A. Jones, third. The first prize for six stove and greenhouse plants was well won by Mr. T. Lambert, gardener to Lord Harlech, Oswestry, who staged very fine specimens of Dipladenia amabilis, Ixora coccinea, I. Pilgrimi, Croton Warreni, a splendid example; Allamanda Hendersoni, and Kentia Belmoreana. In a second class for six stove and greenhouse plants, the awards were secured by Mr. A. Jones, Oaklands; Mr. Tugwood, Leighton Hall Gardens; and Mr. H. Cliffe, in the order of their names, all showing good produce.

For a dozen table plants the chief award was secured by Mr. J. Edmonds, who showed light and elegant crotons, dracænas, and pandanus; Mr. A. H. Hall, gardener to J. C. Waterhouse, Esq., Prestbury, Macclesfield, second. Mr. R. C. Townsend, gardener to Colonel R. Lloyd, had the best half-dozen orchids, showing Cattleya gigas and C. Mossiæ, in two varieties each; Cypripedium barbatum, and another Lady's Slipper. The best half-dozen tuberous begonias were neat, well-flowered plants of good double varieties, shown by Mr. B. R. Davies, Yeovil; Mr. Jones, gardener to A. M. Barber, Esq., Wellington, second; and Mr. H. Cliffe, gardener to R. Taylor, Esq., Abbey Foregate, third, with huge plants. Pyramidal coleuses were good, being well furnished and highly coloured; Mr. A. Myers was first for four plants, about five feet high; Mr. J. H. Slaney, second; and Mr. J. Barker, third. Gloxinias were fairly good, but rather past their best in some cases; Mr. J. Parson Smith, Abbotsmead, secured first prize with splendid plants carrying large, shapely, and bright flowers; Mr. H. Cliffe, second; and Mr. R. C. Townsend, Oswestry, third. Zonal pelargoniums made a lovely display, and in the class for half-a-dozen specimens Mr. A. Myers, Shrewsbury, secured first prize with magnificent plants, carrying grand trusses that were not formally tied down to the foliage; Mr. A. Bateman, second; and Mr. H. Cliffe, third.

FLORAL ARRANGEMENTS.

The floral arrangements were most beautiful throughout, and though the Messrs. Perkins and Sons, of Coventry, gained a good many of the leading awards, they were not always first, and this alone will serve to illustrate the high quality of flowers and designs. A class for six bouquets and six baskets of cut flowers, brought out a lovely display, in which Messrs. Perkins and Sons, Coventry, secured the chief award, together with silver cup, with a lovely collection of floral designs; the baskets were especially lovely, even for the Messrs. Perkins. One consisted of white pancratiums over maidenhair fern, with spikes of the pure white Francoa ramosa rising gracefully above the whole. Another was a rich and gorgeous design of odontoglossums, Cattleya gigas, Lælia crispa, Dendrobium Phalænopsis, and Oncidium flexnosum; a basket of Cypripedium Lawrencianum, asparagus, and yellow oncidiums was also good. Messrs. Jones and Sons, Shrewsbury, came second, with a choice group of handsome arrangements; Messrs. Jenkinson and Son, Newcastle, Staffs, third. Messrs. Perkins and Sons had the best ball and bridal bouquet, a handsome pair of designs, the ball bouquet being a gorgeous affair in gold, purple, and white orchids; Messrs. Pope and Sons, second; and Messrs. Jenkinson and Sons, third, out of four sets.

For ball and bridal bouquets, orchids excluded, Messrs. Jones and Sons, Shrewsbury, were first with arrangements of roses, stephanotis, carnations, and lapagerias. Mr. W. Tresider, Cardiff, had the best shower bouquet of cactus dahlias, a fine lot of gold and buff blooms and croton leaves. For a sweet pea bouquet Messrs. Pope and Sons were first, using rose and white flowers; there were seven sweet pea bouquets staged, Messrs. Perkins and Sons coming second, and Mrs. Lovatt, Chetwynd Grove, third. For six each of ladies' sprays and gents' buttonholes, Messrs. Perkins and Sons, Coventry, were easily first with tasteful and light productions of orchids and roses; Messrs. Jenkinson and Sons, second; and Messrs. Jones and Son, third. There were eight collections. Mrs. Lovatt, Chetwynd Grove, had the best stand of cut flowers, showing sweet peas, pale blue, yellow, and rose flowers, amid maidenhair fern and plumes of Agrostis nebulosa.

CUT FLOWERS.

Only one exhibitor exhibited thirty-six bunches of sweet peas in as many varieties in competition for the Eckford Challenge Cup. This exhibitor was Dr. Sankey, Boreatton Park, who had a goodly set nicely staged. This ten-guinea cup must be won three times before it becomes the property of any competitor. The first prize for eighteen varieties of sweet peas was won by Mr. A. Bessell, High Street, Ludlow, who staged his flowers with gypsophila; he had splendidly fresh blooms of Lottie Eckford, Little Doritt, Lemon Queen, Prince Edward of York, Countess of Powis, Mrs. J. Chamberlain, Mars, Senators, Mrs. Eckford, Countess of Radnor, Lovely, Meteor, Venus, Salopian, Gaiety, Boreatton, Blanch Burpee, and Lady Mary Currie; Mr. C. Barnett, gardener to H. Aldersey, Esq., Chester, second; and Mr. T. Aldersey, third.

Mr. A. Myers, Shrewsbury, scored a first for six trusses each of double and single varieties of zonal pelargoniums, with splendid trusses of substantial and bright flowers that, unfortunately, were not named; Mr. H. Huxter, second; and Mr. T. Maddock, third. For asters, Mr. J. Davis, gardener to W. G. King King, Esq., Roderham Manor, was first; but asters were not shown so extensively as usual at Shrewsbury. The best dozen carnations, selfs, fancies, or yellow grounds, were beautiful and highly-developed flowers, chiefly of yellow grounds, shown by Mr. A. W. Jones, Handsworth, Birmingham. Messrs. Thomson and Co., Birmingham, staged the best set of twelve picotees, three flowers of each. Mr. Myers, a most successful pelargonium grower, of Shrewsbury, offered prizes for the best six trusses of zonal pelargoniums, single and double; there was a good competition among the Salopian gardeners, and Messrs. Huxter and Cliffe were placed first and second respectively, both showing handsome, bright, and well-developed blooms. Gaillardias made a brilliant show, and the Messrs. Harkness were the most successful exhibitors of these gorgeous flowers, staged in bunches of six blooms.

Roses were poor, as one might expect at so late a date and after so dry a season. For two dozen blooms, Messrs. D. and W. Croll, Dundee, secured the first prize, their best flowers being Mrs. J. Laing, Charles Lefebvre, Her Majesty, Earl of Dufferin, and Gustave Piganeau; Messrs. Harkness and Sons came second, and Messrs. Perkins and Sons, Coventry, third; the roses suffered intensely from the heat. The best eighteen spikes of gladiolus, distinct sorts, were staged by Messrs. Harkness and Sons, Bedale, who had massive flowers and spikes of the Gandavensis section; Mr. R. Morrow, Leominster, second; and Mr. R. C. Townsend, third. Messrs. Keynes, Williams, and Co., Salisbury, secured the first prize for pompon dahlias, putting up a pleasing set of Little Jack, Lady Blanche, Emily Hopper, Arthur West, Bacchus, Phœbe, Agate, Midnight, Whisper, Nerissa, Lilian, and Elegant; Mr. R. Campbell, High Blantyre, second. For half a-dozen bunches of cactus dahlias, Mr. J. Davies, was the most successful competitor. Mr. R. Campbell, High Blantyre, secured first prize for show dahlia blooms, showing charming flowers of J. Walker, Mrs. Saunders, Colonist, Norma, The Reverend, Ethel Britten, Eclipse, Mrs. Chamberlain, and Muriel; Mr. S. Mortimer, Farnham, was a good second, these sets making a rich display. Mr. B. Cromwell won first prize for a dozen bunches of cut flowers, with Dipladenia, Brearleyana, Gloriosa superba, Stephanotis, Anthurium Scherzerianum, Ixora coccinea, Bougainvillea glabra, and lovely clusters of red and white lapagerias; Mr. J. MacDonald, second; and Mr. J. Lambert, third.

COLLECTIONS OF CUT BLOOMS.

The classes for displays or collections of cut blooms arranged on a certain space always result in a magnificent display in the large marquee at Shrewsbury, for as a rule both quality and artistic arrangement are good.

Five collections of dahlias were shown there, making a beautiful display as one looked along the whole bank. Mr. W. Tresider, Cardiff, was placed first with a collection put up in the orthodox style, on boards and in bunches of ten blooms; the single and cactus varieties were beautifully fresh and finely coloured, the pompons were also extremely pretty; Mr. M. Campbell, High Blantyre, came second, but Messrs. Keynes, Williams, and Co., Salisbury, third, showed by far the most artistic display, though perhaps a little more finish was necessary to make it first-class. Mr. R. B. Davies, Yeovil, easily won first prize for a collection of begonias, cut flowers and plants in this case, putting up neat plants carrying magnificent flowers in all bright shades of colour; Stella was a large double salmon-pink form, and Thunderer a grand double scarlet. Messrs. Jones and Son, Shrewsbury, set up the finest display of cactus dahlias, showing [illegible]

(Continued on page 547).

LEAVES FROM A RAMBLER'S NOTE-BOOK.

HARVEST IN FRUITLAND.

FOR a seemingly long time the train remained at a standstill in a little station on one of the lines that wind their way through hop gardens and fruit orchards in the county of Kent. No one noticed the delay for a while, and then one after the other the passengers rose, and with head and shoulders protruding through the window asked all kinds of sarcastic questions, such as: "Are we going to stop here all day?" "Has the engine fire gone out?" and so on. One portly gentleman, who, from his well groomed appearance and important air, might have been either a commercial traveller or a member of the Stock Exchange, rose from his corner, threw down his paper, and hurled uncomplimentary epithets at railway companies in general and this one in particular. "It's a beastly shame," he said, "that all the passenger trains should be kept waiting through the fruit traffic. Why can't they send their strawberries and things by goods train, or else run specials for them, instead of stopping every train in this provoking manner?" No one seemed to know exactly why the railway company did not act according to the important gentleman's suggestion, and therefore kept discreetly silent, with exception of one passenger, who had a distinctly agricultural Kentish look about him, and hitherto had not offered any remark. "It's quite certain you a'int a grower, sir," he said dryly, and then sucked at his pipe with a resignation which suggested that he was quite contented to wait till the train was ready to start. At length the last basket of strawberries had been put in, and, after backing into a siding and hooking on several vans laden with fruit, the guard blew his whistle, the train started, and the important gentleman in the corner retired once more behind his newspaper.

This sort of thing is quite common during the fruit season, and perhaps it never occurs to those who buy their fresh strawberries, gooseberries, cherries, and so forth, every day, where they all come from and how they are transferred from the producer to the consumer. At every station along the route there was the same delay, but after the timely rebuke recorded above, the portly gentleman kept his own counsel, probably calling the fact in mind that he was not the only person who had an interest in the services of the railway. In the goods yards and on the platforms were mountains of round sieves and tubs, some empty and others full, reminding one somewhat of the piles of barrels in the sidings at Burton-on-Trent. Waggons piled high with baskets, tier upon tier, filled with fruit, stood in the sidings, and impatient growers worried the already harassed officials, with enquiries about empties. Two important items seem to concern Kentish growers during the busy season, and in both of these he may regard himself as somewhat helpless. The first and most important is the "returns" or "prices," and here he is in the hands of the salesman, and must contentedly pocket what that individual sends, be it much or little. Not that the grower is, as a rule, antagonistic to the middleman, but on the other hand he has a fair amount of confidence in him, and knows that when the market is full of fruit, prices must necessarily fall. The second item is "empties," and here the grower is at the mercy of the railway company unless he lives near enough to the market to take his produce up by road. When fruit is spoiling for the want of picking, and there are no baskets to put it in, the grower worries himself, and no wonder. He worries the carriers in vain, and yet I do not think he has succeeded in fully convincing them that the quick transit of empty sieves to the fruit plantation is quite as important as delivering them full into the market.

It would appear then that all the ordinary uninterested individual knows about the Kentish fruit industry is either gathered whilst travelling by train, or else when he purchases his ripe fruit from the tradesman who supplies it. But the fruit harvest affects a wide community. Men, women, and children all take their share, and if you ramble along the highway in a fruit district towards evening you meet them, strings of women and children, each family accompanied by the inevitable perambulator which contains the youngest olive branch, who alone has the dignity of a conveyance, and sundry other articles necessary to a day in the fields. These pickers belong to the local population, and in Kent female labour brings a good deal of grist to the mill. Hop-tying and gathering, fruit picking, and other work on the farm, keeps the women employed, and judging from the chubby appearance of the youngsters, life in the fields is conducive to the healthy rearing of a family. There is another picking fraternity quite distinct from the foregoing. It is the London element, who make a sort of holiday of the fruiting season, and they present a marked contrast to the sun-browned Kentish folk, who treat them with suspicion, and never get on intimate terms with them. Natural instinct seems to tell them when the season has begun, and from squalid courts and alleys emerge equally squalid types of humanity, who swarm along the highways leading to the strawberry and raspberry fields to take part in the harvest. For the most part ragged in appearance, vulgar in conversation, and uncouth in laughter, comparison with the native pickers is by no means favourable to the results of training amid the contaminating influences of town life. The brief contact with Nature, however, does them good. Old and young lose their wan, pinched looks, and return looking brown and healthy. What effect the country holiday has on their morals I am not in a position to say, but if not beneficial, it is because the fruit harvest is not long enough.

The London picker is not an expert, and, though skilled labour is not absolutely necessary for fruit gathering, growers prefer local pickers when they can be got. Particularly is this so in the cherry harvest; and the way in which some of the females perform acrobatic feats on the tall ladders among the branches suggests that, with a little professional training, they would have made their mark on the trapeze or the tight rope. Cherry picking is to all intents and purposes only a commonplace occupation, but long practice makes perfect, and the agility with which experienced pickers of both sexes scale the ladders, and with baskets strapped on their backs gather with both hands, as though posed in the branches of a cherry tree were the safest place in the world, is remarkable. A cherry orchard at gathering time is a busy place. The bright red fruit glittering among the leaves in the sunshine is a picture in itself, and an element of tragedy is introduced in the person of the boy who, with important mien, meanders about under the shade of the trees armed with a gun to keep off the thieving birds. He keeps up a brisk fire, sometimes to the danger of the pickers in the branches, and one cannot help admiring the unassumed impudence of any birds that will essay to steal cherries amid such a babel of laughter and conversation. At one corner of the orchard is a small marquee, the headquarters of the pickers, and round about are piled the heaps of full and empty sieves. Deftly must the ladders be manipulated, so as not to break branches, as a cherry tree is a valuable piece of property, and quickly one after the other the trees are stripped of their luscious burdens. The man who has charge of the packing arrangements transfers the fruit to the sieves, which are lined and covered with paper, and in succession the waggoner, railway man, market porter, and salesman play their part in the harvest, and eventually also does the costermonger, who cries "Cherry ripe" from door to door.

Naturally, fine weather has an important bearing on the Kentish fruit harvest, particularly so with soft fruit. This season has been a fortunate one, as little rain fell during July, and fruit was marketed in a splendid condition. There have been, and still are, some complaints about crops, but the mutterings generally begin when prices are discussed. Questions applied to different growers anent the crops have elicited the answer "that they mustn't grumble," and when a Kentish fruit farmer goes thus far you may depend that he is more than half satisfied with the result. Get on the subject of returns, and he changes his tune. It has been a season of surprises and sudden drops. First consignments sold well, beyond the growers' expectation, and in consequence he dispatched heavily the next day. In many cases the returns fell to half the former price, and with this elevating and dashing of hopes the fruit season drags itself along. At the beginning, some people prophesied a glut, others failure, but both were wrong. Generally speaking, bush and berry fruit crops have been fairly heavy, though it seems difficult to prove to many growers that good crops and low prices amount to about the same thing as half the weight of fruit and double the returns. Harvest time with most cultivators of land is not of long duration, but among Kentish fruit plantations it begins when the first tiny green gooseberries are stripped from the bushes and continues till the last of the apples and pears have been dispatched. Though much of the traffic is carried on by special trains, at times of pressure the ordinary service is affected, and if my portly friend is a constant traveller I hope there will always be someone present to chide his grumblings by reminding him that he is not a grower. How circumstances alter cases! H.

SOME INTERESTING NEW FRUITS.

The Logan-berry.

IN the spring of 1897 we planted a few examples of the logan-berry on a low south wall, making special preparation for the roots before planting. The plants were rather weak, having come direct from America, but the canes grew from five to six feet high during the summer and ripened well. This year nearly every eye on the blackberry-like canes has produced a raceme of fruit. The fruit is much larger than the largest raspberry that I have ever seen, and somewhat resembles a mulberry in its dark colour and long shape. There is two much acidity in the ripe fruits for them to be largely eaten in a raw state; had they possessed more sweetness, doubtless the logan-berry would have become a popular fruit for dessert, but now I should think few people would make use of it in that way. It will produce fruit about the same time as the raspberry in the open garden, where it will readily succeed, so that it can be mixed with that fruit for tarts. Last week I had a tart made of logan-berries and raspberries mixed; after adding extra sugar it is very acceptable. The plant is vigorous, making canes like the Crimson Rambler rose, and fruiting nearly the whole length. The fruiting canes should be taken out in the autumn, so as to give room for the young canes; these should be secured to either wall, trellis, or stake. It is also vigorous rooting, and repays for mulching and watering. I should think it will grow in any sheltered corner further south, but here we grow it in the open on a trellis.

Strawberry-Raspberry.

This was introduced at the same time as the logan-berry, and planted against the same wall; it is a distinct plant, producing suckers like the raspberry, but these only grow about eighteen inches high, and flower on the current year's canes. It is questionable whether this plant will produce and mature crops of useful fruit in the north, even in front of a south wall. Messrs. Childs, of New York, advise growing it in pots under glass, and I have no doubt it will, thus treated, prove an interesting plant. The fruit is very handsome, not large, but I cannot speak of the flavour yet. I may lift a plant and grow it under glass, and should it prove useful, I will send a note of it in the autumn.

The Golden May-berry.

This is not so hardy as the above, for plants placed in the open have died, while those planted against a south wall have barely come through the winter alive. One of them has made a shoot three feet long this summer, and that is about the extent of our experience with it.

Alnwick Castle Gardens. GEORGE HARRIS.

NEW PLANTS, FLOWERS, FRUIT, AND VEGETABLES.

CORTADERIA JUBATA.

A HANDSOME and strong-growing grass, closely allied to the well-known Pampas grass. It produces large plumose panicles one to two feet long, pale straw-coloured, with a rosy-purple suffusion. Unfortunately this beautiful grass is not perfectly hardy in the British Isles, for, at Belgrove, co. Cork, Mr. Gumbleton's garden, it succumbed to 29 degrees of frost during the winter of 1896. According to the *Bot. Mag.*, t. 7,607, Cortaderia jubata was discovered by Colonel Hall, near Quila, in Ecuador, at an altitude of 10,000 ft. It was found in 1830, and subsequently introduced to European cultivation by Mons. Lemoine, who obtained seeds from Chimborazo.

TCHIHATCHEWIA ISATIDEA.

This is a dwarf-growing crucifer, less than a foot in height, clothed with stout, hairy leaves, and producing a branching head of bright rose-coloured flowers. It is apparently a quite hardy perennial, as, according to the *Bot. Mag.* t 7,608, it flowered in the open at Kew, in 1898, on plants raised from seed sent from St. Petersburg Botanic Gardens in 1896. The plant has a sturdy stem that branches towards the top; the leaves are abundant, generally sessile, linear-oblong, obtuse, from one and a-half to two and a-half inches long, recurved, greyish-green, and hairy on both surfaces. The flowering branches together form a semi-circular corymb, four inches across, crowded with small but bright reddish-rose flowers. Tchihatchewia isatidea is a native of Armenia, and was discovered by the late Count Paul de Tchihatchef, at an elevation of five to six thousand feet near Eryinham in the province of Erzeroum.

BUDDLEIA VARIABILIS.

This is a quite new plant, differing very largely in general appearance from the well-known Buddleia globosa. It is an ornamental shrub that will probably need protection in most parts of the country; under favourable conditions it will grow eight feet high and flower during July and August. The foliage is variable, the leaves being opposite, joined at the base, and from four inches to a foot long; the shape varies from oblong-lanceolate and obtuse, to linear lanceolate and cardate acuminate; they are always entire, crenate, or coarsely serrate, dark green above and paler below. The rosy-lilac flowers have a tube half an inch long, and a four-lobed limb; these are produced from the axils of the upper leaves and bracts in crowded globose heads that are shortly peduncled, the end of a flowering growth having the appearance of a dense spike, until closely examined. This Chinese plant was discovered by Dr. Henry, in Hupeh and Ichang, and by Faber and Potani in the Tibetan province of Kam. There is a large plant at the Jardin des Plantes, Paris, and one sent from thence to Kew flowered against a wall in July, 1897; as inflorescence is figured in the *Bot. Mag.* t 7,609. Messrs. W. Paul and Son, Waltham Cross, exhibited specimens at a recent R.H.S. meeting, and gained an award of merit, as stated in these columns.

LEDUM GLANDULOSUM.

Ledum glandulosum is an erect-growing evergreen shrub that has proved hardy at Kew. Its dark brown bark is conspicuous. The leaves vary from one to two inches in length, are elliptic, dark green above and silvery beneath. The simple racemes of white flowers are borne in terminal corymbose clusters. There are five concave petals to each flower, and these are ciliate above the middle. Ledum glandulosum was originally discovered by Douglas in 1826; it was found also by Sir J. Hooker and Dr. Gray in the Silver Mount Pass of the Sierra Nevada, California, in 1877. It has, however, a wide distribution in Western North America at a considerable elevation. *Bot. Mag.*, t. 7,610.

RIBES VILLOSUM.

A perfectly hardy Chilian shrub and one that retains its foliage during ordinary winters. A specimen has been growing in the Kew Arboretum for the past fifty years, where it flowers every year in June, producing an abundance of short racemes of deep golden yellow flowers. All parts of the shrub are sub-glandular-tomentose. The growth is erect; leaves orbicular-ovate, often broadly three lobed beyond the middle, slightly convex above, crenately toothed, bright green above and pale green below. The racemes are about an inch and a-half long, and densely flowered; the fruits are pea shaped, violet-black, and hairy. *Bot. Mag.*, t. 7,611.

CRINUM WOODROWI.

A fine bulbous plant from Central India, producing a stout peduncle a foot or so in height, which carries an umbel of six or seven flowers, each fully three inches long and composed of six lanceolate segments that are white. The filaments are bright red, and anthers dark yellow. The bulb is globose and has no neck; about four inches in diameter. Few leaves are produced, these being a foot long, and three or four inches broad. The species was discovered by Mr. G. M. Woodrow, of the Poona College of Science, and bulbs sent to Kew in 1897 flowered well under stove treatment. *Bot. Mag. t.* 7,597.

MORISIA HYPOGÆA.

A pretty little early-flowering plant, now largely grown in rock gardens; it is dwarf and stemless, with pinnatifid or pinnatisect and bright green leaves, amid which the numerous golden flowers appear on slender peduncles. It is a quaint little monotypic crucifer from Corsica and Sardenia, and has the curious habit of deflexing the scape after flowering, thus burying the ripening fruit in the soil. *Bot. Mag. t.* 7,598.

CELASTRUS ARTICULATUS.

This interesting shrub comes from Eastern Asia, where it has a wide distribution from Japan to Formosa, and from the North of Peking to Ichang and Amoy. It is a strong grower, rambling and twining, and thrives near the sea, salt spray not injuring it. The green obovate or oval leaves have crenate-serrate margins. The insignificant dull green flowers are produced in small cymes, but are followed by a capsule that is most brilliant after the foliage has fallen. This is pisiform, brown, and three valved, the valves being yellow on the inside; as the capsule ripens the valves reflex showing their yellow surfaces and revealing the seeds enclosed in a bright scarlet aril. Seeds sent to Kew in 1891 produced plants that flowered in June, 1897, and fruited in November of that year. *Bot. Mag. t.* 7,599.

PHILADELPHUS MEXICANUS.

This spreading or drooping shrub produces very large, fragrant, and solitary flowers of a creamy hue. It is not quite hardy at Kew; and Sir J. D. Hooker states in the *Bot. Mag.*, t. 7,600, that he finds no character whereby it is distinguishable from a solitary flowered specimen of P. grandiflorus, save that of fragrance. It is a common Mexican plant, but is likely to be of little value in this country save to the hybridist.

CALLIANTHEMUM RUTÆFOLIUM, VAR. ANEMONOIDES.

Sir J. Hooker considers the five published species of callianthus are reducible to forms of one. The variety anemonoides is an European alpine form, having triangular leaves five inches across, and composed of numerous three or five lobed leaflets. The flowers are an inch and a half across and have ten to fifteen petals, white or pale and rose coloured. This variety is a native of Styria. *Bot. Mag.*, t. 7,603.

IRIS GRANT DUFFI.

Mr. B. T. Lowne collected this fine yellow iris on the banks of the River Kishon, Palestine, in 1864; but some years later Sir M. E. Grant-Duff found it at Esdraclon, and, recognising it as a distinct species, introduced it to cultivation. It is allied to I. tenax and to I. Douglasiana, both North American species. The rhizome is creeping, but the base of the stem is swollen, and enclosed in a brown sheath; the linear, white margined leaves grow to a height of about two feet. The flowers are wholly yellow, save for the lower halves of the falls, which are streaked and veined with red-brown. *Bot. Mag.*, t. 7,604.

CALOCHORTUS CLAVATUS.

This pretty Mariposa lily grows about eighteen inches high, and has a forked, sparingly leaved stem. Its large flowers are composed of three small yellow sepals and three very broad, cuneate, yellow petals, sometimes as much as two inches wide; the bases of the petals are hairy. C. clavatus was recently introduced to cultivation by Mr. Carl Purdy, of Ukiah; the species are Californian. *Bot. Mag.*, t. 7,606.

PHYLLOSTACHYS CASTILLONIS.

This is a large-growing and extremely handsome bamboo, very graceful, and clothed with lanceolate leaves about six inches long, light green, striped with creamy-white. A.M., R.H.S., July 26. Messrs. J. Veitch and Sons, Chelsea.

STRAWBERRY LADY SUFFIELD.

A highly-flavoured strawberry bearing medium-sized fruits of a bluntly-conical shape, some of them being inclined to wedge-shape. The colour is dark crimson, flesh deep red and firm. A.M., R.H.S., July 26. Mr. Allan, Gunton Park Gardens, Norwich.

CULINARY PEAS.

The Fruit and Vegetable Committee of the Royal Horticultural Society visited Chiswick Gardens on July 22, and selected seven varieties of peas for awards. Three marks were awarded on that date, and the A.M. recommended and confirmed at the Drill Hall on July 26.

The Bruce, a stout-growing mid-season variety; a marrow pea, growing 5 ft. high; the pods are large, square-ended, in pairs, and well filled with sweet peas. × × × July 22; A.M., R.H.S., July 26. Mr. H. Eckford, Wem, Salop.

Prior, a splendid second early pea, 5 ft. high, producing an abundance of large deep green pods of splendidly-flavoured peas. × × × July 22; A.M., R.H.S., July 26. Mr. H. Eckford, Wem, Salop.

Continuity, a late variety, carrying its deep green pods in pairs; a fine marrow pea, and apparently a good dry-weather variety. × × × July 22; A.M., R.H.S., July 26. Messrs. Sutton and Sons, Reading.

Saccharine, a very sweetly-flavoured pea, free, about 4 ft. high; a heavy cropper. × × × July 22; A.M., R.H.S., July 26. Mr. Sims, Fyvie, Aberdeen.

Honeydew, a very dwarf marrowfat pea, growing 2 ft. high; a mid-season variety, strong grower, and most prolific; pods contain seven or eight fine peas. × × × July 22; A.M., R.H.S., July 26. Mr. Sims, Aberdeen.

Mansfield Show, a splendid variety, only 3 ft. in height, and carrying an enormous crop of well-filled pods; a maincrop pea. × × × July 22; A.M., R.H.S., July 26. Messrs. Wright Brothers, Mansfield, Notts.

Hartford's Success, a strong-growing mid-season pea, growing about 3 ft. high, and producing a good crop of deep green marrow peas in medium-sized but well-filled pods. × × × July 22; A.M., R.H.S., July 26.

NOTES FROM CHILLINGHAM CASTLE.

A FEW days since I had a pleasant drive by way of Chillingham Castle to Wooler and back; and, resting a couple of hours at Chillingham, advantage was taken of the opportunity for making a hasty survey of the many good things in the gardens and about the castle. Amongst the wall fruits some good crops of plums and apricots were seen, but my attention was specially attracted by an extraordinary tree of Bigarreau Napoleon cherry, which when measured was found to be fifty-seven feet long. I have not seen the equal in size of this tree, and it was bearing an extraordinary crop of fine light-coloured fruit. This tree is probably [illegible] years old, and it is planted on a wall facing west in a fine strong loam, in which apples finish well, and asparagus thrives for a great many years with very little special care. We have a tree of this variety in light soil facing east, but it crops indifferently. On a low wall facing east, we noted the blackberry, Wilson Junior, in the most robust, thriving condition, where it fruits abundantly, and is highly appreciated after the raspberries are all gathered. If liberally treated at the roots and all old fruiting canes cut out and the new ones nailed in during the winter, the new canes break at every matured joint and fruit abundantly. The Royal Sovereign strawberry produces a splendid crop of large, fine-shaped, bright-coloured, good flavoured fruit. We find this strawberry is now considered the finest strawberry ever seen in this district. M'Mahon is still the best late kind. We shall gather some nice fruit up to the 18th. Bush fruit does exceptionally well in Chillingham Gardens. The condition of the place reflects the highest credit on its able gardener, Mr. Henderson.

Chillingham is famous for the herd of the pure-bred wild cattle that roamed through the forests of Britain centuries ago. On our way to Wooler, we pass the village of Chetton; rounding a hill, we obtain the first view of Wooler, situated at the foot of the most northern heights of the Cheviot Hills; and when we climb the heights beyond the town and look northwards, there is a fine view of the Lammermoor Hills north of the Tweed, and a little to the west, only a few miles from Wooler, we see the battlefield of Flodden and the beautiful Eshendale. Turning to the south we see, seven or eight miles distant, the highest peaks of the Cheviot range, truly a beautiful district in which to spend a few days, for here a person should be able to forget some of his troubles, if afflicted with any, and gain mental and physical benefit from the beautiful scenery and the clear bracing air.

GEORGE HARRIS.

Alnwick Castle Gardens.

BRITISH-RAISED ROSES.

THE list of roses of British origin which have achieved the greatest eminence is now a very comprehensive one. Of late years we have been especially indebted to such firms as the Pauls, of Waltham and Cheshunt, and the Dicksons, of Newtownards. Lord Penzance has given us some valuable hybrid briars, of which, perhaps, the most attractive are Jeannie Deans, Amy Robsart, and Lady Penzance, which, however beautiful, have this serious limitation, that they are even more evanescent than the Austrian briars, which I have elsewhere described as "dreams of beauty too bright to last." The Messrs. Cocker, of Aberdeen, have been the raisers of several roses of the greatest attractiveness, of which the latest introduction, Mrs. James Cocker, is an interesting cross between Mrs. John Laing and Mabel Morrison, and partakes to some appreciable extent of the attributes of both; though I do not hesitate to say that I prefer it, in some respects, to either of these. Through a special kindness of the Messrs. Cocker, I have it at present in bloom in my garden, and admire it greatly; much more, indeed, than Duke and Duchess of Fife, or Duchess of York, and that is saying much.

Of the numerous roses raised by Mr. William Paul some of the finest are Pride of Waltham, valuable for exhibition; Crown Prince, which has always been very popular with the great French rosarians; Beauty of Waltham, a rose of much sweetness, which still retains its olden popularity; Clio, a worthy rival of Margaret Dickson; Duke of York and Queen Mab, the two last named China roses of much fascination, which, however, have not succeeded well with me either in a shady or sunny situation; also Corinna, Medea, Enchantress, and Empress Alexandria of Russia, tea roses of great beauty.

From Messrs. Paul and Son, of Cheshunt, have come several very useful garden roses; also such brilliant varieties as Duke of Teck, Charles Gater, with its exquisite shading of marone, the lustrous Cheshunt Scarlet, and Sultan of Zanzibar; also that grandest of all the Bourbons, Mrs. Paul, a remarkable derivation from Madame Isaac Pereire, a rose of richest fragrance and imposing dimensions.

The varieties which were raised by the late Mr. Henry Bennett were so very numerous that not a few of them, such as Purity and Laurence Allen, have only quite recently been for the first time introduced. Of the older and more familiar roses of his raising are Mrs. John Laing, an immense favourite with exhibitors, by reason, probably, of its reliability; for I cannot help thinking that in colour it has already been surpassed, though in size and in form it could not easily be improved; while it is also very prolific. Viscountess Folkestone, one of the most precious, for colour and perfume, of the hybrid teas; Grace Darling, Lady Mary, Fitzwilliam, which were also notable acquisitions to this important section; and those beautiful tea roses, both of them unfortunately somewhat difficult of culture, by reason chiefly of their incapability of vigorous growth; Princess Beatrice and Princess of Wales. The great majority, however, of Mr. Bennett's roses are splendid growers, and exceedingly productive in the floral direction, giving but little trouble to the earnest cultivator.

Of very similar characteristics are the Newtownards roses; especially the many famous hybrid perpetuals and hybrid teas which have emanated from that region. It would be difficult to discover a better variety for garden culture than Margaret Dickson, or a grander specimen for effective exhibition than Marchioness of Londonderry. I find that while the former is comparatively indifferent to atmospheric influences, the latter is very easily affected by the influence of rain; from which, therefore, previous to exhibition it requires protection. It has considerably less fragrance than Margaret Dickson, and its colour is not so fine; but, on the other hand, it is a much fuller and more majestic rose. Mrs. Sharman Crawford is a variety which may be placed in the same category, and also it seems to me, on the same high level, with Mrs. John Laing, to which it is at least equal in form (though not in size) and superior in complexion. Mrs. W. J. Grant is a very beautiful rose, especially in its earlier stages of development. Hitherto I have regarded it as being somewhat deficient in central petals, and therefore not entirely satisfactory when full bloom, but I am gratified to learn from the Rev. H. Foster-Milliar that it has been exhibited in the most perfect form at the Woodbridge show. It has also been finer in my own garden than formerly this year; probably because I gave it more than usual attention. Other meritorious roses raised by the Messrs. Dickson are Lady Helen Stewart, Mrs. James Wilson, a tea rose, after the form of Catherine Mermet, though widely different in colour, and even more difficult of floral expansion; Helen Keller, Earl of Dufferin (which the Dean of [illegible] would probably describe as "a bright, dark rose"); Marchioness of Dufferin, which, like Her Majesty, has been somewhat over-estimated; [illegible], which, on the other hand, has not yet received, perhaps by reason of its somewhat dwarf growth, that recognition which its fragrance and beauty deserve; Jeannie Dickson, Ethel Brownlow, Ulster (not yet [illegible]), Ethel Richardson, and Countess of Caledon. Most of these [illegible] have distinctive characteristics.

Of other roses raised by British rosarians the most important are Prince Arthur, a native of Colchester, for which we are indebted to Mr. Benjamin R. Cant; Sir Garnet Wolseley, and the Crimson Bedder, valuable chiefly for garden culture, which have come to us from Hereford; and Mrs. Harry Turner, whose name is suggestive of the place of its birth.

Since writing the above I have been gratified to learn that the new Scottish rose, Mrs. James Cocker, for which I had previously predicted a successful future, has gained the gold medal of the National Rose Society. Besides being a highly fragrant variety, it is fascinating alike in form and colour, and is certain to prove a most valuable acquisition.

DAVID R. WILLIAMSON.

[illegible] Manse, Wigtonshire, N.B.

EARLY TOMATOS.

IT may at first sight seem out of place to write about early tomatos at a season of the year when the fruits are plentiful, but to secure early fruits next year one must be on the alert now, and make preparations accordingly. Many growers sow in November or December to obtain early supplies, but if sown at the earlier date, with bad weather intervening, growth is slow, the progress made is poor, and the crop cannot be termed a very early one, as May will be in before fruits are ripe. My observations do not refer to market culture of tomatos, but simply to a limited number of plants for home supply; and to meet the demand we raised plants in August.

For some years I relied on plants raised from cuttings struck in the autumn, but this was only a partial success, as the cuttings did not grow free enough from November to January, and in the latter month many of the plants became smaller, instead of larger, and so we had to look for another and a more suitable system. Fog is one of the worst enemies the tomato has to contend with in mid-winter, for as they need light and air they soon show signs of distress after a few days' fog, and we found cuttings could not stand extremes of any kind like plants raised from seed. Many may think by giving warmth the evil effects complained of could be counteracted, but this only adds to the evil, for the cooler the plants are kept from November to January the better in every way for them, as they then start away freely into growth, and when given more warmth as the days lengthen they respond quickly.

Some varieties are more difficult than others to winter, and those of the Perfection type, though our most shapely fruits are not so suitable for winter or early spring fruiting; on the other hand, I am disposed to think that any kind which grows rank should be omitted, though one may do much by pot culture, and to curb the roots and cause free setting. My best winter variety for years was Horsford's Prelude, but the fruits came very small. Conqueror was tried, and this comes much corrugated, but many of our best kinds come so more or less when grown under adverse conditions. The last few seasons we have grown a selection of the Old Red, and this is reliable, not a smooth fruit by any means, but one must not be too particular with fruits at the season named. Last year Frogmore Selected proved a reliable setter early in the year, and I hope to grow it in greater quantity this season. Still, most readers will admit we have not yet secured a tomato that will set fruits in winter, I mean from November to January. Fruits set previous to the earlier date are valuable if they can be retained, as these will swell and ripen in February and March.

Culture is simple; we sow early in August and grow the plants as hardily as possible from the start, sowing in cold frames and potting the seedlings when large enough, still keeping the plants near the glass, and when the plants are strong enough we leave the sashes off at night to ensure a sturdy habit. By October the plants have filled a six or seven-inch pot, and they are wintered in these in a cool house, or shelves near the glass, just keeping them from frost. Water is given very sparingly from November onwards, but if any fruits are set at the lower part of the plant, a little fertiliser is given, to keep them moving. We pot up in poor soil and as firm as possible from the first shift, as growth is not so much needed after November; if heat is used, air is always given by the top ventilators. In January the plants are started by being placed in small pits, and either potted into nine-inch pots, or planted out in beds. We prefer pots, and these are placed on a warm bed with a couple of hot water pipes beneath, the house being kept at sixty degrees by day, and five to ten degrees lower by night. Those planted out have no bottom heat; indeed, those in pots have very little, for there is a thick layer of ashes over a slate bed under which the pipes run. If the plants need shifting in November we treat them accordingly in preference to keeping them in small pots, but the moisture supply needs more care. Flowers show readily in February; these are fertilised, and the plants have weak supplies of liquid manure. Useless growth is removed, and each plant is kept to one stem; a dry atmosphere is maintained by giving heat and air, and by careful watering early in the day. Plants not grown in pots are only given a very narrow border, and this is rammed as firm as possible at planting, with a liberal quantity of wood ashes or old mortar rubble mixed in the soil; these fruit freely, giving ripe fruits by the middle of April, and they will fruit for months if fed and given surface dressings. I have given seedlings raised in the early winter every attention, but failed to have fruit as early as from plants raised now; on the other hand, plants that are very large winter badly, and much better results are obtained from plants grown as hardy as possible from the start, as these respond better to the warmer treatment early in the year.

G. WYTHES.

Syon Gardens.

Salvia patens.—Undoubtedly the Salvia patens is the best blue bedding out plant we have for large beds, and yet it is much neglected I have a large bed of it edged with the white-leaved pelargonium Flowers of Spring, and this makes a grand and effective combination. Salvia patens was first introduced in 1838 from Mexico; it grows two and a-half feet high, with most beautiful spikes of blue flowers, and these continue to expand till frost comes. This good old plant should be in every garden, as it is easily increased by seed sown during March in sandy soil and placed in heat. As soon as the seedlings are large enough, prick them off into pans or pots, planting them out in the beds about the middle of May; they flower well the same season. Cuttings strike freely in sandy soil in heat. At the end of October I take the old roots up, and store them away for the winter, planting them in sand under the greenhouse stage till the end of March, when they are potted off and put in pits or greenhouse. When the growths are about six inches long they strike readily. When using Salvia patens for small beds, I always peg the growths down, and they then flower remarkably well, while only growing from twelve to fourteen inches high.—W. SMYTHE, *Basing Park Gardens, Alton.*

CYMBIDIUM LOWIANUM AT CLARE LAWN.

FEW East Indian orchids of such decided merit deserve to be classified as "cool" as the subject of this note, and few of the whole natural order give such profitable and continual good results under a cool treatment. Cymbidium Lowianum was sent home by Mr. Boxall, V.M.H., to the Messrs. Low, of Clapton (now of Enfield), in 1877, he having collected it in Burmah. Thus, it will be seen, it has just attained its majority as a resident in our glass houses. Like most other tropical orchids, or, rather, those coming from a tropical country, it was naturally assumed to be a lover of a high temperature, little information regarding the altitude at which it was found, climatic and other conditions, being given. Therefore, it was left to experiment or accident to determine its proper position in our orchid houses. In our case success is due to experiment, a large plant being placed in the house the whole batch now occupy fully a year before the others were removed to it. That they are at home may be seen by referring to the accompanying illustration, reproduced from a photograph. When our ten plants were in bloom, in 1897, there were one thousand and sixty flowers. This season they were much better, the same plants producing one hundred spikes, bearing in the aggregate one thousand six hundred and twenty-eight flowers. One plant—the central one in the picture—had twenty-seven spikes, averaging sixteen flowers each. Another plant carried seven large spikes, one of which had thirty-six large, well-developed flowers, and most of the others thirty and thirty-two. The house in which they are growing is what might be termed a cool fernery; here, in the gardens of Sir F. Wigan, Bart., it is called the Rock House, owing to the majority of the ferns being planted in or growing on artificial rockwork. The cymbidiums are in pots or deep pans, dropped into pockets formed by other pots or pans bedded in and surrounded by the artificial rock or tufa.

CYMBIDIUM LOWIANUM, AT CLARE LAWN, EAST SHEEN.

The cultural details followed by us have been previously given in the pages of the GARDENERS' MAGAZINE, but as success with this grand and useful orchid is a thing very much to be desired, there will be no harm in setting them before its readers again. In the first place, I may as well state that they are permanent residents in this cool house, where the temperature drops within a few degrees of freezing point in severe winters; but this low degree appears to suit them rather than otherwise. Any potting or topdressing necessary is performed during the latter part of May. Receptacles rather large in proportion to the size of the plants are used, as they produce such enormous quantities of thick fleshy roots, which in a small pot would neither find room or a sufficient quantity of plant food for their development. The pots are about one-third filled with drainage material, on which some of the rougher portions of the potting material is placed to keep it free. The compost consists of equal parts of lumpy peat and fibrous loam, about a sixth part of well-rotted farmyard manure, and sufficient coarse silver sand or broken crocks to keep the mass porous. Very little watering is done until it may be safely assumed that the roots have taken hold of the new material, when the supply should be gradually increased as the season advances. At no time should the water be withheld for long, though, owing to the cool and moist atmosphere in which they are grown, the soil will remain moist for a long period. Plants that have not been repotted this season should be supplied with weak liquid manure, especially when the bulbs are forming. Shading is always used from the end of March until the end of September, whenever the sun shines on the house in a direct manner. Air in abundance is always given, excepting for about six weeks after the plants have been disturbed at the roots, then the top ventilators are closed about five, and remain so until about eight next morning. On all bright days the plants are syringed overhead twice daily, from the time the flowers are over until October comes in, and, owing no doubt to the abundance of air, no harm happens to the young growths through water lodging in them.

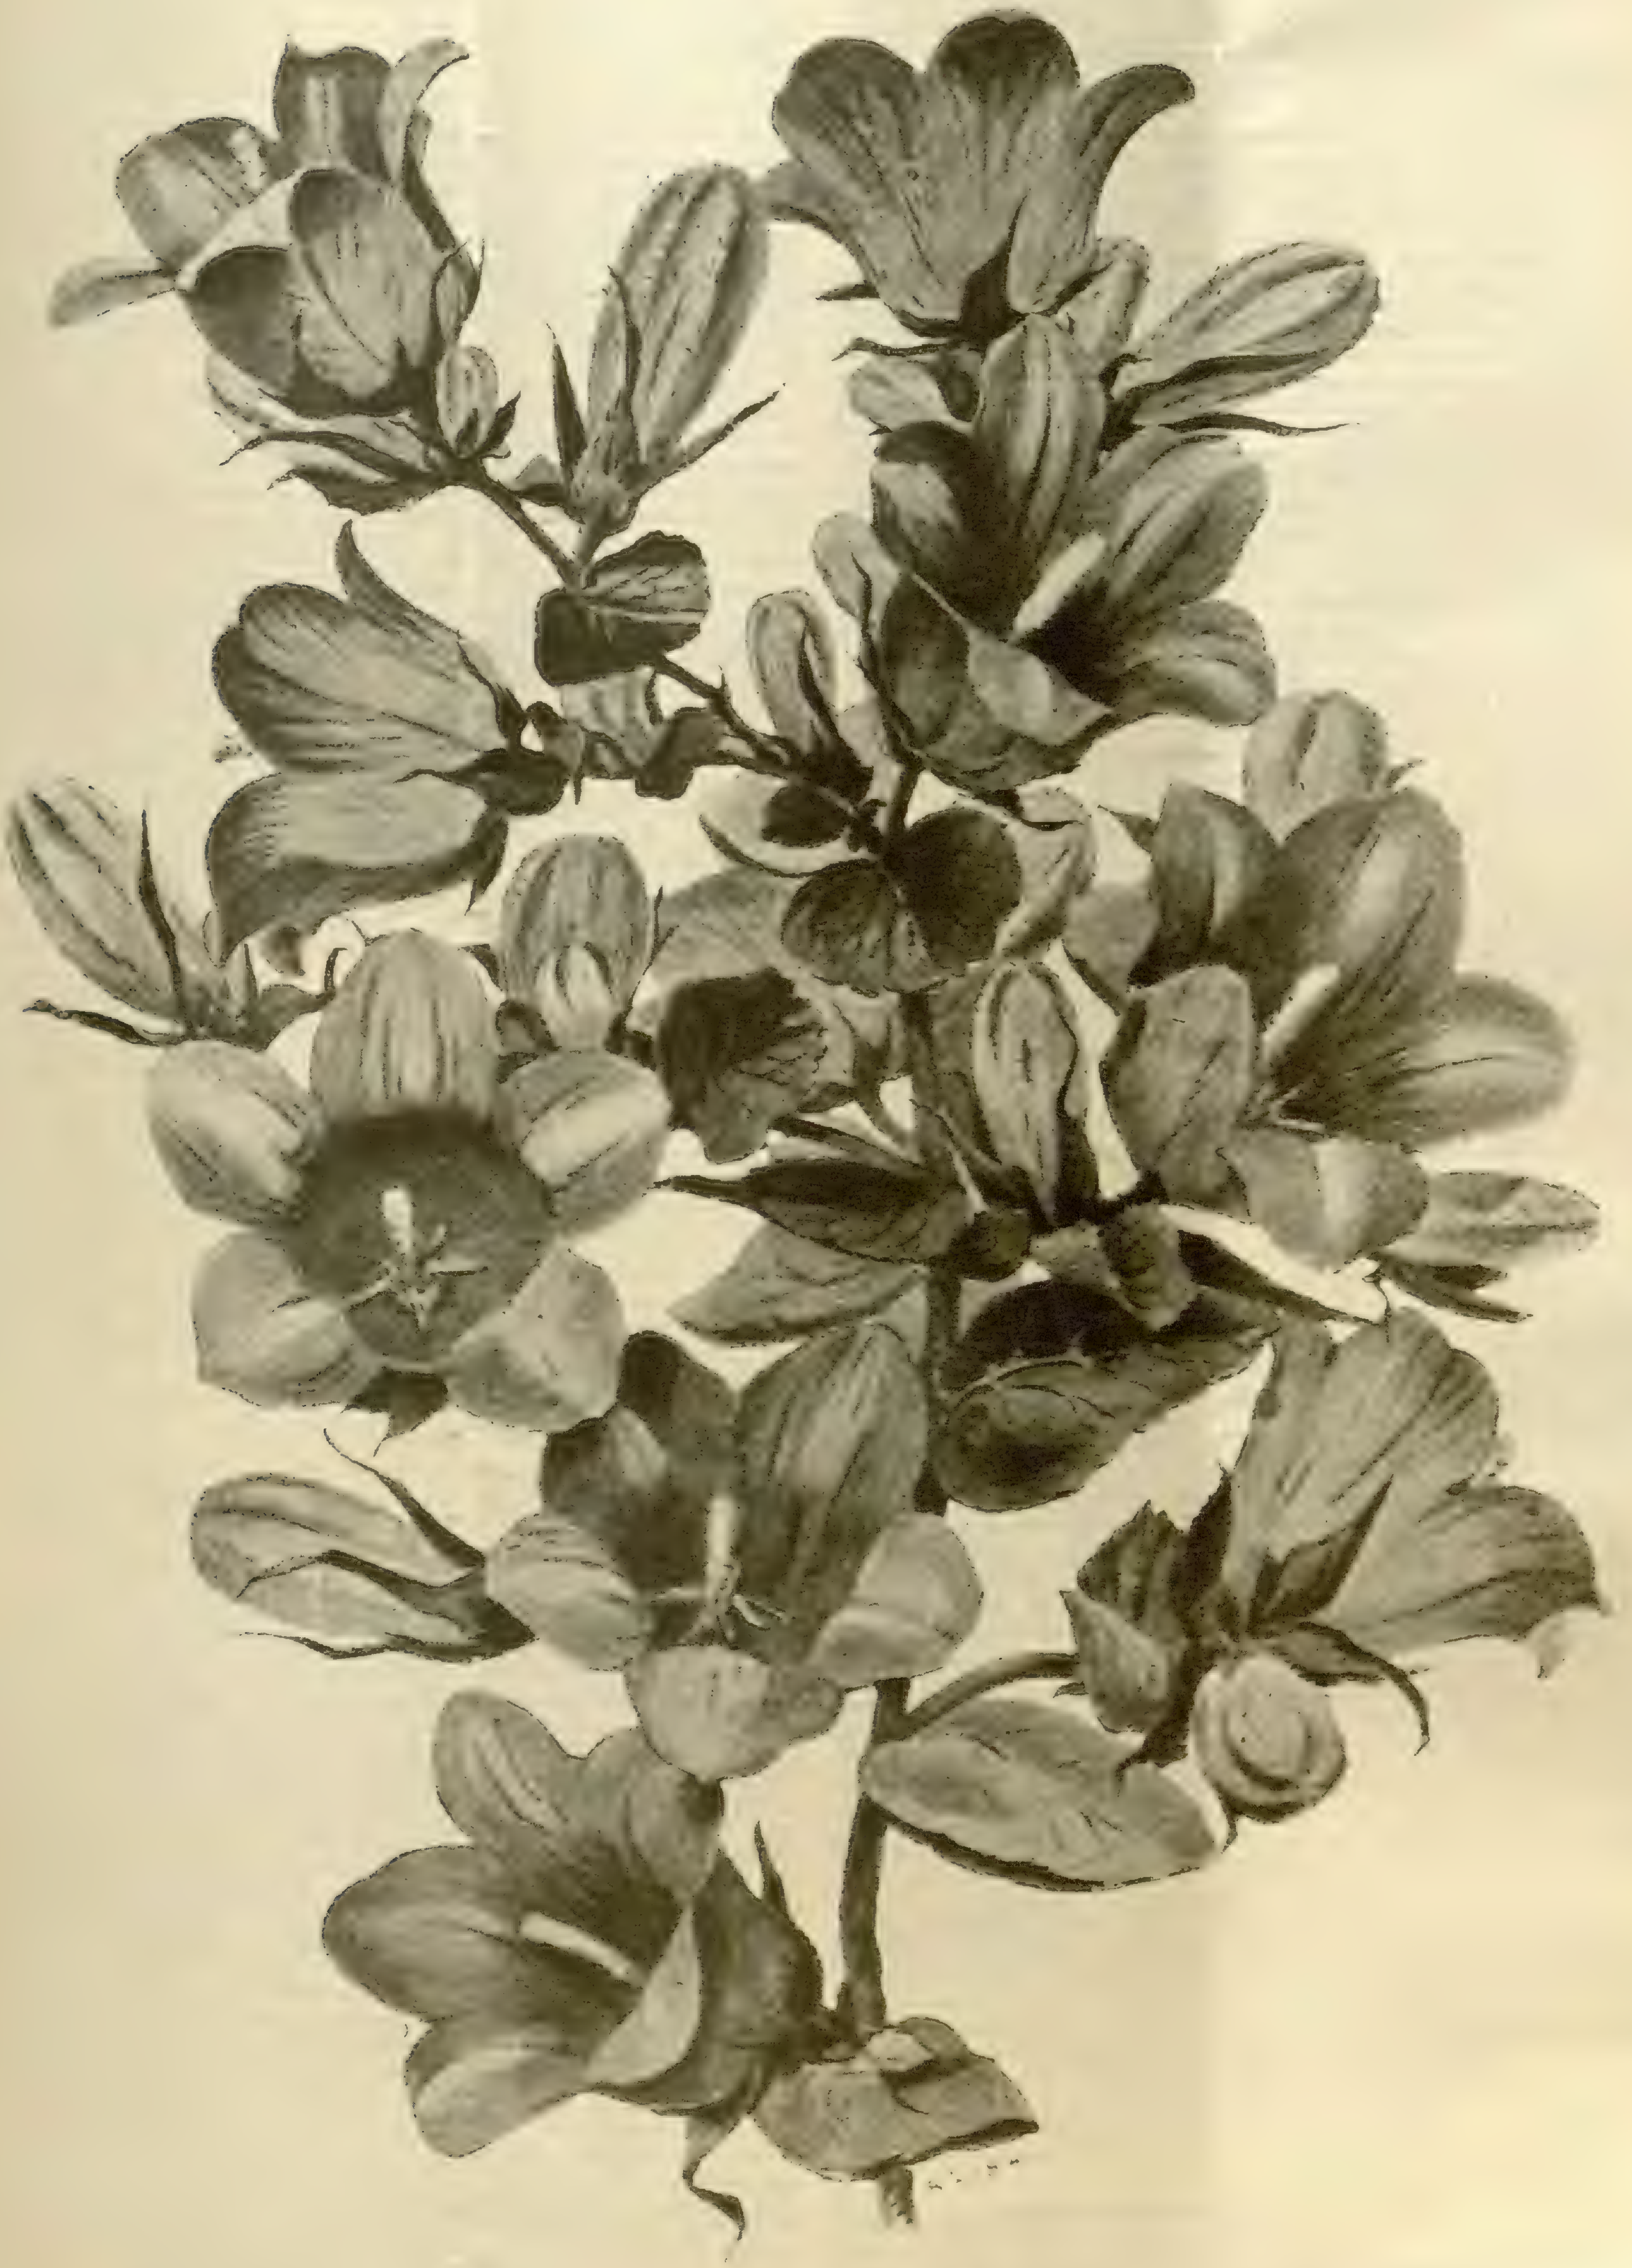
As will be seen from the foregoing remarks, the chief points to remember in the cultivation of Cymbidium Lowianum are, a cool temperature, a moist and airy atmosphere, combined with shade and good living. Under these conditions insect pests never attack our plants, excepting that in the spring, when the spikes are young, green-fly sometimes tries to secure a foothold, but is easily removed with a damp brush.

East Sheen. W. H. YOUNG.

CAMPANULA MIRABILIS.

A NEW species of campanula, and one of undoubted horticultural value, is certainly very much of a novelty nowadays when nurserymen begin to despair of obtaining new plants of merit other than by hybridising. This week, however, we figure a very distinct species, that has been brought forward by Messrs. G. Jackman and Sons, Woking; this is Campanula mirabilis, for which the firm recently gained a first-class certificate from the Royal Horticultural Society (see *G. M.*, p. 429, July 2). C. mirabilis was discovered in the Caucasus by Mons. Alboff; it is a perennial, quite hardy at Woking, and making a very handsome pot plant. Before the pyramidal flower spikes are produced the plant consists of a dense flattish rosette of orbicular or ovate-cordate leaves, shining green, and with toothed margins. The panicle or spike is erect, and branched quite from the base; the flowers are numerous and handsome, of large size, and broadly bell-shaped. The colour is very pale blue in the tube, but of a brighter shade at the spreading five-lobed mouth. A few hairs are found on the sepals, corolla lobes, and on the stems of the plant. We understand that very small plants will flower, consequently we may expect finer inflorescences than have yet been seen in this country, when strong plants are well established.

Perpetual Strawberries will form the subject for discussion at the meeting of the Royal Horticultural Society to be held at the Drill Hall, St. James' Street, S.W., on Tuesday next, August 23. A paper will be read by Mons. H. de Vilmorin, one of the leaders of horticulture in France, and a gentleman well known this side of the Channel both for his wide knowledge and [illegible] disposition.



CAMPANULA MIRABILIS.

WORK FOR THE WEEK.

COOL ORCHIDS.

THE season has now arrived for the general examination of odontoglossums, consequently any plants of O. Pescatorei, O. triumphans, O. tripudians, O. Halli, O. luteo-purpureum, O. elegans, O. excellens, O. maculatum, and O. cordatum that require a shift should be attended to. Plants that are in good material, and in receptacles large enough for the development of the next season's growth, should not be disturbed in any way, as only those plants that have overgrown their receptacles, or are in sour material will need to be repotted. These latter should be turned out and all the old material possible shaken off without injury to the living roots; cut away all decayed roots. Pots of a suitable size for the development of two season's growth should be used, and if these are new from the pottery they should be put into a tub of water to soak before use; afford drainage to within two inches of the surface, using clean crocks, and over this put a thin layer of clean sphagnum moss; the compost should consist of equal parts of peat and moss, and if the moss be long it should be chopped up, these should be well mixed together with some finely broken crocks, charcoal, and a sprinkling of coarse silver sand. The plants should be raised a little above the rim of the pot, and be potted moderately firm, a few living heads of sphagnum being pricked in over the surface and kept occasionally sprayed over to encourage it to grow, as this greatly improves the appearance of the specimens. The watering of the newly potted subjects is of the greatest importance, and should receive careful attention, for if overdosed with water failure is sure to follow; dew the plants over head once or twice daily if the weather be fine and bright.

At this season the heating apparatus in the cool houses should be examined and put into good working order, ready for the winter; any loose joints in the hot water pipes must be made good, and valves and air taps be oiled, so that all will be in readiness when wanted. It is of the greatest importance that sufficient pipes be provided to supply the necessary temperature when the water is moderately warm, for when only a few pipes are supplied they have to be kept excessively hot, especially in hard weather, and this is one of the greatest evils in cool orchid culture, and often causes the plants to quickly deteriorate.

Lælia præstans is now growing and rooting freely, and will require a liberal supply of moisture, but the compost should always be allowed to become moderately dry before giving water. The same remarks apply to Oncidium ornithorhynchum, as this species is now growing and producing its flower spikes freely. Odontoglossum cirrhosum is also growing freely, and will enjoy a large supply of water; a position should be found for these three species at the warmest end of the cool house.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

THE demand for carnations in a cut state appears to be ever on the increase, and in many gardens large stocks of pot plants have to be grown for the production of bloom during the winter months. With suitable houses, and a good collection of plants that have been properly cultivated during the summer, there is no great difficulty in meeting the demand, and it would be difficult to point to any class of plant that is so much service to gardeners who have large quantities of cut flowers to provide. One chief thing is to see that there is always a young stock of plants coming on. With the best of treatment and skill the plants cannot always be depended upon to come into bloom exactly at the same time each season. To make sure of the flowers at the time they are most wanted it is necessary to have them in different stages of growth at the close of summer. It is now too late to alter the conditions of the stock this season, but not to make provision for another year. Cuttings with a heel will strike readily now if a gentle hotbed is provided. Suitable cuttings will be found on the stems of those which have been flowering during the summer. Select those about four inches long, and, as mentioned before, with a heel. Fill a number of four-inch pots with rich sandy soil and insert the cuttings about half their length, keeping them by the side of the pots. Give a thorough soaking, and then plunge the pots up to their rims in cocoa nut fibre refuse, which has been placed over the fermenting material. Ventilate the frame carefully so as not to cause a draught, and see that the sun does not reach the cuttings until roots have formed. When it is seen that roots have formed give more ventilation, and eventually remove them to a cold frame, but arrange the pots well up to the glass to ensure a sturdy habit. The points may be pinched out, and directly side shoots commence to form divide the plants carefully and pot up singly. This will give a good batch of plants to be wintered in small pots, and the following spring they may be repotted and grown on during the summer, making large plants before autumn. If another batch of cuttings are put in next spring these will form a good succession. Carnations that were put out in the open last spring, and that are intended to flower during the winter, must soon be lifted and potted.

Double primulas, especially the white varieties, are also valuable for winter flowering, as they are so continuous. It is time now they received their final potting. Any bloom that is showing should be pinched out for the next few weeks to encourage leaf and root growth. Give good rich friable soil, affording free drainage, as the plants are likely to go off suddenly at the collar during a spell of bad weather if the compost becomes at all water-logged. In potting, sink the ball well down, so that the lower leaves are on a level with the soil, without which the plants would become top heavy and fall over on one side. The habit these plants have of going off suddenly may be prevented to a great extent by giving more warmth and affording water carefully. Keep the plants close and shaded after each potting, a cold current of air through the house or frame, in which the plants are arrayed, causes the foliage to turn yellow, and care is required afterwards to bring them into a free-growing state again. Weak soot water once or twice a week may be given to large plants which have filled their pots with roots, or they may have a sprinkling of Clay's fertiliser occasionally. The different kinds of winter-flowering plants that succeed under the planting-out system during summer, such as salvias, veronicas, salanums, bouvardias, and others of a similar description, should now have their roots cut in by a sharp spade. If the longest roots are severed in this way at once, new rootlets will form near the stems of the plants, and little or no check is given when they are lifted.—R. PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

THE importance of sowing things at the proper time at this season of the year cannot be too well understood, for a few days makes all the difference to a crop. The weather, too, plays an important part, for when the ground is parched young plants cannot make satisfactory progress. On the other hand, when cold, wet weather prevails many small things suffer seriously. Preparation should, however, be made for planting spring cabbages as soon as the ground can be cleared of its summer crop. The cabbage in many gardens is considered to be one of the prime crops, and many gardeners pride themselves of being able to cut very early in the season. It is usual in many places to plant after onions, the ground being in a fair condition as to fertility. There is, however, much difference in soils, for in some places it is so light and sandy as to need a liberal dressing of manure for every crop, while in others it partakes of the nature of clay. If of the former nature, a dressing of manure should be given as soon as the crop is taken off; this being dug in the soil should be made firm again by treading, as the roots cannot take hold of loose soil. If left thus for a week or two, the autumn rains will usually make the ground sufficiently solid for planting. In exposed situations it is a good plan to draw shallow drills, as by planting in these shelter is afforded during rough weather in winter, particularly when the drills are drawn north and south, as during cold easterly winds, the ridges afford some protection. The distance allowed between the rows and plants must, in a measure, depend on the quality of the soil, but for any of the early kinds eighteen inches each way will be ample. In dealing with land that is stiff, far more care is needed, for unless dug at the proper time, and planted when in fair condition, it will prevent the water passing away freely, and thus instead of there being early cabbage, a good portion of the spring will have elapsed before growth commences. It is not well to make land of this description too fine on the surface, as both heavy rains and frosts cause the particles of soil to run together until the water has much difficulty in penetrating, the consequence being plants suffer much in winter. Where those from the first sowing are large enough to handle, these ought to be picked out to prevent their becoming drawn. They should be freely watered in dry weather, so that there be no check.

The late sowings of carrots ought now to be thinned, but this must be done with discretion, according to the variety, from two to three inches being ample. Endive should be planted, where the situation is low and damp, on the driest portion of the garden, otherwise the plants will suffer should there be a quantity of rain fall during the autumn. For the late sowings choose a south border, and allow sufficient space between the plants that the air may get among the foliage to prevent the leaves from rotting. Make a sowing of hardy cos lettuce, such as Hicks' or Brown cos. Those from former sowing should be transplanted as soon as large enough. Cuttings of lemon and other thyme should be inserted in a cold frame, likewise such herbs as sage and others of a shrubby nature. The lifting and storing of potatos will now form an important item in this department, as many of the second early kinds are quite ripe. When the ground is cleared of the crop, it should be forked over and made ready for turnips. This latter being one of the most important of our winter root crops, should on no account be neglected; a goodly breadth ought always to be put in, as crisp, sweet, roots are always in demand. The thinning of former sowings should be commenced as soon as the plants have made two or three rough leaves that they may be kept sturdy. Continue to make small sowings of radishes and other salads, as these are still much in request. Use every means to keep down weeds, which always grow apace at this season of the year, and if neglected soon form seed which is scattered over the garden.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

Pot figs for early forcing will require a season of rest before they are again started. Excitement of any kind will start them again into growth, or, at all events, cause them to cast their crops later on; and, on the other hand, exposure of the pots to the drying influences of sun and air outside will result in shrivelling of the wood. The best method of treatment is to put the plants outside, and mulch over and around the pots with long litter, so that the roots may be cool while the tops are fully exposed. The mulching will obviate the necessity of frequent waterings, but the roots must by no means be allowed to dry, and it is advisable to syringe the trees overhead every afternoon, after hot days, as this will keep both the wood and the embryo fruits plump. Any weakly wood that is not required should be removed, if this was not done some weeks back when recommended, as such wood is only a nuisance, and will not carry fruits. I advised, too, a while ago, that any trees needing repotting should be attended to then, so that they could become somewhat re-established before being put outdoors, but it may still be done if necessary, only means must be taken to prevent souring of the soil afterwards, and it may be necessary to keep them for a time under cover. Planted out trees will go on fruiting and ripening second-crop fruits for some weeks longer if allowed to do so, and in the case of well-established trees I see no objection to their doing this, for there is no difference in next year's first crop through the little extra strain, and the fruits come in now most conveniently where there are no successional trees.

Late melons are required in many establishments, but they are frequently poor things when they ripen under dull skies, and when the sun heat is reduced; a melon house to supply late fruits cannot be too light or clean, and must have a good supply of artificial heat. This must be borne in mind just now, and though the exact aspect or heating power of the house may be beyond the control of the grower he can at least insist on cleanliness. The glass should be well scrubbed inside and out, as also should be all stagings, and a liberal supply of whitewash applied to all walls and other parts of the interior. If the house has been already occupied with cucumbers or melons it is advisable to clear out all living plants, and then set light to a pan or two of sulphur, shutting the house up closely in the meanwhile, and leaving it so for several hours. This will eradicate all insect life, and prepare the way for a clean start. Late melon plants are best grown in pots, and these should not be over-large, neither is it advisable to attempt big crops from the plants. Great care should be taken not to bruise, or cause other damage to the stems and main leaves, as canker follows such injuries, and is especially fatal to the plants later in the year. Melons in manure-heated pits have had a struggle this year, but they have done remarkably well with me, probably from the extra attention given to the linings necessitated by the dull, cold weather. From now onward the frames should be matted up every night, and every effort made to conserve what sun heat we may get, as the nights are becoming long, and by the morning the drop in temperature will be considerable unless the glass is covered with some warm material.

The present is an excellent time to carry out any lifting and replanting operations that may be necessary in the early peach and nectarine house. When trees from any other cause than old age are not satisfactory, the secret of their ill-doing is generally to be found at the root, and as trees may be lifted and again planted without any fear of interfering with next year's crop, provided the work is done carefully and the after treatment is right, the cause should be sought for and rectified. Space will not permit me here giving details as to the carrying out of the work, but I may say that with fairly young trees I never trouble about lifting with a ball of soil provided I can get the roots almost intact, and I believe injuries often accrue from attempting too much in that way. If the tree is well lifted and the fresh soil well worked in among the roots without bruising them, and then given a good soaking of water no harm will come to it. It may be that the glass will need shading for a few days, and that syringing the foliage will be helpful in keeping the wood plump, but these things combined make up a much easier matter than lifting extension-trained trees with balls of soil big enough to help them, and more than answers the same purpose. See that the drainage [illegible] right, the soil good for the roots, and above all, that there is no deficiency [illegible]—J. C. TALLACK, *Livermere Park Gardens.*

THE FORTINGALL YEW.

Fortingall, the Perthshire parish which is as large as a German Duchy, is one of the most interesting districts in Scotland, alike to the naturalist, the botanist, the antiquary, and the lover of fine scenery. In what corresponding space of country, asks a correspondent of the *Dundee Advertiser*, will you find as much of varied interest as here, where Druidical remains compete for notice with early Christian monuments, and where a Roman camp stands as an outpost to a chain of Caledonian torts of unknown antiquity? Where, too, such variety of scenery, from stern Loch Rannoch and Schiehallion, white as a "maiden's breast," in the north, to the smiling shores of Lock Tay in the south, from the green and fertile haugh which lies before Fortingall village, encompassed by the Lyon like a silver bow, to the long and crooked and narrow glen which winds between high hills for thirty miles, which opens at the picturesque Pass of Glen-Lyon and ends in Argyllshire? One hardly knows which phase of interest to note first—the beautiful or the ancient, the curious or the merely pleasing. But perhaps the antiquarian relics of the place are the most valuable, and so we begin with the oldest memorial of the past in the parish—the venerable yew, which has the credit of being, if not the oldest tree in Europe, yet one of the patriarchs of European vegetation.

Says Sir Robert Christison in the inquiry which he devotes to determine the age of this venerable tree: "De Candolle, with the particulars at his command in 1831, estimates its age at 2,500 or 2,600 years in 1770; and alluding to it and a few other yews in England—among which, however, he mentioned only one vying with it in antiquity, he adds—'I venture to indicate these trees to botanists and foresters that they may authenticate them, and establish, if possible, their law of increment, for it is probable that they are

The Veterans of European Vegetation.'"

The other trees mentioned by the French naturalist have all succumbed to Vandalism or natural decay. The Fortingall Yew alone, thanks perhaps to its isolated position ramparted by the Grampians, survives to tell to a wondering Twentieth century the story of its long descent What that story is, however, is largely conjectural. One wishes for the nonce that the "tongues in trees" which the Duke speaks about were a reality, for half an hour's "crack" with the Fortingall Yew would be worth all the cogitations of all the learned societies put together! I think it is in one of Kipling's stories that there is a man who is a mere commonplace City clerk, but who has a vision of his former incarnations, who has rowed in a Roman galley on the Mediterranean, and so on, and who, under certain conditions, has a curious blurred consciousness of the past. Could we lay our ear to the vocal trunk of this old tree what might we not hear? The murmur of the primeval forest and the wood cries of innumerable wild things; the crash of the rocky barrier rent by some wild convulsion of Nature, which set free the imprisoned waters of the lake, which up to that time had filled the valley of Glen-Lyon; the sound of the Druids' hymn and the shrieks of the victims as they bled beneath the knife to fill the stony cups of those ancient altars with a red [illegible]; the cries of Pictish warriors ere ever there were Celts in the land; the steady tramp of Roman legions coming to encamp on the "heath-field" close by, where yet their trench and mound stand for a memorial of them;

The War Cry of the Fionne

as they descended from their castles to fight, to plunder, and to ravage; the blithe shouts of Scotland's monarchs and their merry men as they went to the hunting; the view-halloo that set the bloodhounds on the track of Wallace and Bruce; the savage onslaught on the landless and proscribed Gregarach—these are some of the memories that the yew might whisper of—and it would. But it remains silent, and gazing on the "sullen tree" we are, like the Laureate, "sick for thy stubborn hardihood." In all seriousness, however, the yew is the oldest object, next to the everlasting hills themselves, that the eye meets at Fortingall. It was probably the earliest temple for men's worship in the valley, and itself the altar and the deity. For the Druids, as we all know, worshipped trees, and though the oak was the supreme object of their devotion it is perfectly reasonable to suggest that they may have devoted a portion of their worship to this immortelle of slow growth and dateless age—the yew. The tree is associated from time immemorial with churchyards and the dead:—

> "Old yew, which graspest at the stones
> That name the under-lying dead,
> Thy fibres met the dreamless head,
> Thy roots are wrapped about the bones."

But may it not be that this was the survival of the feeling of an earlier age, and that the dead came to be buried near the sacred yew, until at length the yew with its pillared gloom came to be associated with the departed? The thought is worthy of consideration at any rate. Some people have sought to account for the Fortingall Yew by an allusion to an ancient Act of Parliament that ordered yews to be planted in graveyards for the sake of their tough wood for making bows. But such an attempt is absurd in face of the great age of the tree. Why, the yew was a sturdy sapling when Solomon was building his temple or Isaiah singing his inspired songs, or Daniel reading on the wall the doom of Babylon. Why,

The 7th Century Church

[illegible] it is a thing of yesterday compared to the countless winters of the hoary [illegible]. It stands in the ancient graveyard which surrounds the church, at the east [illegible] of the village of Fortingall. Pennant in his tour mentions having seen it in [illegible], when it was fifty-six feet in circumference. Village Vandalism, however, [illegible] the curio-hunting visitor have greatly interfered with its appearance. At one [illegible] the village boys used to kindle their beltane fires at its roots—a custom which [illegible] the thoughts back in an unbroken line to the Druids and their rites, and [illegible]mongers cut down the branches and turned them into cups and boxes and [illegible] curiosities for sale. In a short time there would have been nothing left of the venerable giant had not a wall been erected round it in the end of last century by the direction of the factor on the Garth estate—a gentleman, it may be mentioned, who was a relation of the late parish minister of Fortingall, the Rev. David Campbell, who took such a scholarly interest in the tree. This still stands, but it has been pierced by two openings protected by railings, which allow more air and [illegible] to visit the tree, the beneficial result of this being apparent in its fresh growth and general appearance of health. Although

> "No branding summer suns avail
> To touch its thousand years of gloom,"

[illegible] still puts forth its fresh green shots as if its roots were not planted deep [illegible] dust of innumerable generations. The huge trunk is now a mere hollow shell, [illegible] apparently three separate trees growing out from it. There is another yew [illegible] growing outside the churchyard wall in a line with the old [illegible] was for some time supposed to have sprung from the spreading roots of the present tree; but it seems that the yew does not shoot up in this way, so the young tree—a mere infant of eighty years old or thereabouts—is most likely a seedling from its soil. What a multitude of thoughts arise in the imaginative visitor as he looks at this ancient yew! How the mutability of human life is borne in upon him, the permanence of nature, the transitoriness of man! whose

> " . . . deepest lays are dumb
> Before the mouldering of a yew."

The yew has always suggested such images to the poet. It seems a sylvan growth which belongs less to the upper world of light and sunshine than to the lower shades.

THE CLOVE TRADE OF ZANZIBAR.

The most important export trade of Zanzibar, from an economical point of view, is that of Cloves (*Caryophyllus aromaticus*), for upon it the revenues of the Sultanate chiefly depend.

The figures which appear in the following table, prepared by Mr. Consul Cave, represent the actual quantities of cloves brought into the town of Zanzibar from the "shambas" or plantations of this and Pemba Islands during the last eight years. The actual clove season, that is, the period during which the produce of the trees ripens and is picked, dried, and brought to market, extends from September to March, and is at its height in January, but for the purposes of this report the year is reckoned in the usual way from January 1 to December 31. 1 frasila=35 lbs.

	Quantity.		
Year.	Zanzibar. Frasilas.	Pemba. Frasilas.	Total. Frasilas.
1890	124,929	384,933	509,862
1891	69,388	324,252	393,640
1892	121,398	236,211	357,609
1893	108,090	259,367	367,457
1894	138,691	372,999	511,690
1895	146,397	391,460	537,857
1896	119,791	237,090	356,881
1897	90,676	240,954	331,630

From this table it will be seen that the yield of cloves during 1897 was less by 883,785 lbs. than in the year immediately preceding, and was, in fact, the lowest recorded throughout the series. The reason for this is twofold. It was due, in the first place, to the unusually dry weather which prevailed during the beginning of the clove season of 1897-98, the total rainfall being only 18·51 inches as compared with a previous five years' average of 24·32 inches, a difference which is quite sufficient to account for a considerable reduction in the yield, and, in the second place, to the important and difficult question of labour.

The clove-tree is one which requires a good deal of care and attention, and which well repays the labour bestowed upon it; it is of course important that the roots should be kept clear of weeds and tangled undergrowth which in this more than in other climates so rapidly grow and spread amongst them, but it is in the picking season especially that the scarcity of labour is felt. Experiments have shown that the buds should be picked when the calyx tubes or stems are of a pink colour; if they are left until the stems become red the latter will be brittle, and the flowers apt to open during the process of drying, with the result that many of the heads, which are composed of the imbricated petals, will drop off and the sample deteriorate in value. If picked too green, on the other hand, the dried cloves will be shrivelled. The buds grow on the trees in bunches, and in each bunch there may be buds in various stages of ripeness; to obtain a good and uniform sample the trees should be carefully watched, and the buds picked as each reaches the certain condition in which experience has shown that it can best be submitted to the subsequent process of drying. To properly carry out this method, however, would require a far larger number of labourers than either the Arab landower is able to employ or the country to supply, indeed, the reduction of the number of slaves by natural causes, gradual at first but more rapid as time goes on, and the effectual suppression of all the methods by which a fresh supply used in former times to be obtained, has had such a serious result for the clove-planter, that he not only finds it impossible to attempt to carry out any of the methods by which he is now well aware that his crop may be improved and his income increased, but is often only too glad if, by mutual arrangement with his neighbours or by some other means, he can engage a sufficient number of hands to ensure his trees being cleared, in whatever condition the buds may be, and to prevent the cloves being left to rot and fall off for want of sufficient labour to pick them. The decree which was published last year abolishing the legal statutes of slavery, has made the planter's position a still more difficult one, and as Indian coolies, if their emigration to Zanzibar is permitted, will only be available for service under the immediate supervision of Government officials, it does not seem likely that the output of cloves from Zanzibar, so long as its cultivation remains in the hands of the Arab, can ever again reach the high figures to which it attained in previous years. Whether this would be altogether a matter for regret, or whether by reducing the stocks of cloves at home, it would not rather tend to improve the price of the commodity in proportion as its production decreased, and so act as an incentive to those who still cultivated it to produce an article of a higher commercial value, is a question on which different opinions may be held, but it is not proposed to discuss it here, or to do more than account to the extent to which this has already been done for the reduction in the quantities which have been put on the home markets during the year under review.

Prices during the first three quarters of the year remained fairly steady at 1 dol. 94 c. for Zanzibar and 1 dol. 76 c. for Pemba cloves, which were the average quotations for 1896, but in the last quarter, at the commencement of the new crop, the prices rose considerably, reaching at one time as high as 2 dol. 80 c. for Zanzibar cloves and 2 dol. 65 c. for the Pemba sample, and bringing the average for the twelve months up to 2 dol. 14c. and 2. dol. 7c. respectively, and it is probable that even higher prices would have been offered if there had not been a very appreciable reduction in the usual demand from Bombay in consequence of the plague. The price which the Zanzibar clove commands in the home markets is never so high as that of the Penang and Amboyna varieties, chiefly, it is supposed, because sufficient attention is not paid to the important process of drying, and the cloves being, in the majority of cases, exposed for too long a time in a tropical sun, much of the oil is evaporated. Experiments which have been and are still being carried on in this respect tend to show that, with proper care, as good a sample can be produced in Zanzibar as in any other part of the world, and it is hoped that, if the Arab cultivator can be induced to adopt the methods which are found to be most successful, the price which he will be able to obtain for his improved produce may ultimately compensate him for the number of trees which, for reasons already alluded to, he is allowing to pass out of cultivation.

THE SEASON'S FRUIT CROPS.

AMPLE evidence has been obtained, were such evidence rendered necessary, that the tree fruit crops of the year generally are somewhat unsatisfactory. Slips between cups and lips are proverbial, and the promise of the spring bloom, a cup literally overflowing, has met with a serious slip, for that promise is very far from being in process of realisation. Oddly enough, we have had a splendid crop of bush fruits, and strawberries. Seldom has there been better, and that fact naturally leads to the conclusion that something other than the cold spring and long spell of low temperature prevalent in April and May had to do with the general tree fruit crop failure. But in relation to tree crops there has been the undoubted fact that if others are thin cherries have been pretty abundant, the crop of these stone fruits having been a very good one. Do, therefore, the atmospheric or root conditions, which seem detrimental to apples, pears, and plums, favour cherries? That is a nut for the clever ones to crack. Who will try to do so? Now the cause of the poor fruit set on trees generally, in spite of such a grand bloom, is very commonly ascribed to the coldness of the spring. Is that rightly ascribed? If it be so, why were cherries so good and bush fruits so very abundant, because these are fruit trees that bloom in the spring, and early, too. Then it is noticeable this year that some trees here and there, amongst others, of apples, pears, and plums are carrying very good crops. Now, I have but just seen out of some fifty young half-standards of Yorkshire Beauty apple, for instance, just a few fruiting well. But last year the bulk of the trees fruited freely; a few did not, It is these few that are fruiting this year, although all the trees bloomed profusely. The moral of that fact is that non-fruitful trees of last year possessed ample stamina to produce pollen in abundance for purposes of fertility, and that all those trees that were fruitful last year did not. But it sometimes happens that trees will bear two crops well in successive years. That being so, why did they not do so this as well as last year? The obvious reason seems to be found in the general dryness of the subsoil, and the incapacity of trees for that reason to recuperate and produce fertile flower buds because of the comparative lack of moisture at the roots. That evil has not applied to bush fruits and strawberries, because these root closer to the surface, and they found ample moisture in that upper soil that got so fairly moistened in the spring. It may be said, why should cherries be an exception amongst the tree fruits? Possibly because these trees have produced very light crops for the previous two or three years. Without doubt, the singular nature of our fruit crop this year, following upon one of the greatest of flower-times ever seen, does present an interesting problem which the suggestion as to the spring's low temperature seems not fitly or fully to solve. If the dry soil suggestion be at all correct, then our prospect of a good tree-fruit crop next year is far from promising. At present the soil is drier than ever, and a perfect flood of water is needed to saturate it. If we do not get that during the winter, we can hardly hope to get it at all; and, although a wet winter is a wretched season, yet such a winter seems very needful. As evidence of the dryness of the soil, we have on every hand statements as to the deficiency of the water supplies in urban districts, and the great need there is for economy in the use of that element. Wells, springs, streams, and rivers are all getting low, because the rainfall for many months has been so much below the average. We have great need that that average should be supplied to enable our trees to carry abundant fruit crops. Even now, where there are but moderate, indeed quite thin crops on trees, the very small size of the fruit is marked. Only where there happens to be specially retentive soil, or water is artificially supplied, are fruits of fair size. When would-be patriots later, as they assuredly will do, quote statistics relating to the immense imports into this country of foreign fruit—probably not largely gooseberries, currants, raspberries, or strawberries—they will tell us that we should plant more trees and grow more fruit. Well, that is excellent lecturing; but did our trees this year but give to us the produce the spring bloom foreshadowed, we should have had truly an immense crop, and vast quantities of the inferior would have been spoiled. If we do not have such fruit produce as we could wish or look for, let the reason be looked for elsewhere than in cultural neglect.

A. D.

HORTICULTURE IN NEW SOUTH WALES.

PERHAPS no portion of the world, of the same area, is better favoured than New South Wales, with its varied climates and soils, for the production of fruits, vegetables, and flowers. It is really surprising how great a variety of plants can be grown to perfection and at a minimum expenditure of labour. Exotics from cold, temperate, and even tropical countries thrive equally well within the limits of this comparatively small area; and still more remarkable is the fact that so many of these plants from different climates will grow side by side in many favoured localities.

With all these advantages it seems strange that comparatively little attention should be devoted to the raising of vegetables for home use, or to the cultivation of flowering and ornamental plants for the adornment of the home of the settlers in the country districts. Occasionally one may meet with a well cared-for, beautiful garden, like an oasis in a wilderness, but, as a rule, few attempts are made even to grow the commonest vegetables for family requirements; and dependence for supplies is placed on Chinese gardeners, whose gardens are generally to be found dotted about the country, especially in the more largely populated districts. The raising of vegetables, the selling of fruit, and the hawking of goods would seem to be almost entirely in the hands of the Chinaman, the Italian, the Syrian, and the Indian; despite the fact that a considerable proportion of the white colonial population consists of unemployed men tramping through the country in search of work, and dependent on the hospitality of the settlers. Considering the little difficulty there is, in most seasons, in producing a sufficiency of fruits and vegetables for a family's requirements in most parts of the colony, it is incomprehensible that the settlers or farmers do not grow everything they need. Instances have been known where vegetables were brought hundreds of miles to localities in which the same kind of vegetable could be grown to perfection with but little trouble. In some places Chinamen will travel from forty to fifty miles carting vegetables to settlers who have soil sufficiently rich to grow all they need, if they took the trouble to devote but an hour or two each day to the work.

In the neighbourhood of Sydney flower-gardening has been made a remunerative occupation by reason of the growing demand for bouquets, wreaths, and floral ornaments, but the continual expansion of the metropolitan suburbs is driving the older nurseries farther afield. A considerable business is done by nurserymen and florists in palms of various kinds, especially that known as Kentia Belmoreana, which is indigenous to Lord Howe Island, and succeeds admirably in gardens about Sydney, and when planted with tree-ferns grows freely and quickly, and is wonderfully effective. The bush-house is one of the most useful of structures in connection with the garden in all the warm parts of New South Wales. In it a multitude of plants can be grown which would be liable to perish in the hot sun. It can be, and is, constructed of all sorts of material, sometimes tea-tree brush, laths, bamboo blinds, and indeed anything that will break the rays of the sun without altogether obstructing them. In numerous gardens about the metropolis and large towns there are glass buildings where tender exotics of climates warmer than that of New South Wales, are grown as successfully as in any part of the world. Everything indicates that the colonial taste for floriculture is improving rapidly, and will continue to improve, a result due in some measure to the fact that there are many excellent gardeners, professional and amateur, in the colony.

A large proportion of the potato and other vegetables consumed in New South Wales is imported from Victoria, where market-gardening is more largely in the hands of white men than in the older colony. The vegetable products of Chinese gardens are mostly of poor quality, insipid and watery, owing to the peculiar method of over-watering and over-manuring adopted. Although these vegetables are of such an inferior character, they are absolute blessings in many places where the colonists either will not or cannot grow those they need. Vegetables of excellent quality can be produced, even in dry districts, with but little irrigation, if they be properly managed; but unless a Chinaman has a superabundance of water he is lost. With a fair supply of water and experienced labour, almost every description of vegetable known in Europe or America can be grown with ease, generally yielding abundant crops.

Sydney. JOHN PLUMMER.

APPLE GROWING IN NEW ZEALAND.

WHILE the Tasmanian grows apples in fifty acre blocks, and gets his neighbours to do the same, the New Zealand fruit grower has generally planted out but a few acres, and those in a large number of varieties, ripening at different times. This fact accounts largely for the higher commercial standing of Tasmania as an exporting colony. But New Zealanders are beginning to realise the disadvantages of their system. A recent offer of their Agricultural Department to send a shipment of apples to England, and give the growers a guarantee of a penny a pound clear, disclosed the weakness of the situation very clearly. Although the Canterbury growers succeeded in completing a shipment in March last, a similar effort in the Auckland province to raise 50,000 bushel cases had to be abandoned owing, principally, to the impossibility of getting contributions in quantities worth handling.

New Zealand apples are probably the best in the world, but the men who grow them are mostly small settlers, who have neither the means nor the experience necessary to develop the industry. The Government pomologists have lately been urging the growers to adopt a different system. The energetic Mr. Blackmore has this season been visiting the orchards of both islands, and his advice may be summarised in a few words: "Plant late apples; nothing but late marketable apples. Plant acres and acres of them. Plant only a few varieties, and get your neighbours to plant the same varieties. Then it will be worth while for a dealer to come into your district and buy the crop, instead of being confronted with never more than thirty or forty cases of a sort at any time during the season."

Mr. Blackmore, being a vigorous advocate of spraying, is not dismayed at the codlin moth. In dealing with this pest a Californian pump called the Bean is coming into great favour. It was first sent to New Zealand by Professor Wickson after whom the latest and best of all Burbank's wonderful Japanese plums is named. Its cost is £7 10s. Its good points are its enormous pressure per square inch—on which the force and fineness of the spray depend—and the fact that it can be worked single-handed, the operator being free to hold the nozzle until the compressed air cistern needs refilling. The codlin moth lays her 200 eggs in the eyes of 200 apples, and the progeny's chance for life depends on his getting through the skin of the apple at a spot where the spray has not fallen. The liquid used is diluted Paris Green. If the grub which hatches from the egg should get through the apple skin without tasting the Paris Green, he makes a bee line for the pips, without which he cannot develop. Having sampled these and filled the core with excrement, he eats a way out through the side of the apple, and makes a cocoon in a crack in the bark of the tree or some other sheltered place, where, if it is not near winter, he becomes a moth in about a fortnight, and the business is repeated. Leading growers, in addition to spraying, tack a narrow strip of sacking round the stem of the trees. These attract the grubs, and about every ten days they are examined and the grubs are killed.

In pruning orchard apple trees and pear trees, the twelve-branch or Tasmanian system is considered the best. The result of the system is to make the tree [illegible] in shape and productive of heavy crops, good fruit, and fruit that can be easily reached. For shaping on this method, yearling trees are planted. Three shoots are grown during the first season. These are pruned back to three or four buds in the winter, and two shoots from each are grown in the next season. The following year the process is repeated, and then there are twelve branches. The tree is then complete. Future pruning has the object of confining all the fruit to these branches, and summer pruning effects this purpose. Just before the crop is gathered, the shoots, which grow out all along the twelve branches, with any other laterals, are shortened to four or five buds. These short stumps do not grow again, but become fruit spurs. The terminal shoots of the twelve branches, however, are always allowed to grow unchecked till the winter. They are then shortened, to induce a new bud to push into growth at the end with renewed vigour next spring. Trees of a spreading habit are cut to an upper bud, and those of an upright growth to an outer bud. The Tasmanian orchards, pruned on this system or a modification of it, present a very effective sight, with the long rows of trees each throwing out its twelve long arms of fruit. The fruit pickers greatly appreciate this style of pruning, too; and it is also found that the more the fruit is borne on the main branches—as it is bound to be by this plan—the better it always is. And it will weather much heavier winds.—*The Field.*

Winter Onions.—I have seen many hundreds of bushels of these autumn sown onions in gardens and on allotments this summer. Rarely have they been seen finer, though perhaps a little later than usual. It is evident the season has suited them. But almost without exception the varieties grown have been Tripolis and Roccas, and I have wondered how many of these fine bulbs have really been utilised properly, and how many have become soft and worthless, and wasted ere they could be used. Spring sown onions, though rather late, have been so far very good. A failure has been rare, and mildew only here and there prevalent. The very finest of all the autumn sown onions I saw in all the county of Surrey was on an allotment, and they were evidently Ailsa Craig. How strange it is that gardeners and cottagers alike cannot be induced to sow in the autumn the hard keeping varieties, rather than the soft Tripolis, as the former would keep well and grow very fine.—A. D.

(Continued from page 538.)

various colours and stands of excellent blooms; Mr. M. Campbell, High Blantyre, second, with a very fresh and bright collection; Messrs. Keynes, Williams, and Co., Salisbury, third, with bunches in the usual show style.

The nurserymen's class for a collection of hardy flowers, annuals and shrubs excluded, was well filled, there being four large groups, all tastefully arranged; Messrs. Harkness and Sons won premier honours, putting up splendid bunches of choice gladioli, liliums, gaillardias, perennial sunflowers, pyrethrums, carnations, &c., every flower finely developed; Mr. W. F. Gunn, Olton, Birmingham, second; Messrs. Barr and Son, Covent Garden, third; and Messrs. Dickson, Chester, a special prize. There were five collections of displays of carnations and picotees staged, and the best set came from Messrs. Laing and Mather, Kelso, N.B., who had beautifully fresh and bright flowers in great variety; easels of Uriah Pike, Miss Muir, Kelso Abbey, Duchess of Fife, and Brilliant were especially good—Duchess of Fife is a lovely carnation; Mr. M. Campbell, High Blantyre, was second, staging huge sheaves of Adele Hamilton, Jim Highgate, Snowball, and Miss A. Campbell; Messrs. Thomson and Co., Sparkhill, third.

The best collection of gladioli, staged on a space of twelve feet by five feet, was staged by Messrs. Harkness and Sons, Bedale, who put up beautifully-developed spikes of variously-coloured blooms, making a fine display; Messrs. R. Wallace and Co., Colchester, second, with a splendid assortment of Lemoinei forms and other charming sorts; Mr. W. F. Gunn, Birmingham, third. Messrs. D. and W. Croll, Dundee, secured first prize for a display of roses, and though the blooms were fresh and fragrant, no great amount of artistic ability was evidenced in the arrangement; T. and H.T. roses were good, so also was Crimson Rambler; Messrs. Pope and Sons, King's Norton, second.

DECORATIVE CLASSES.

One of the principal attractions in the show was found in the class for a large dessert table decorated with plants in pots not exceeding 5 inch, cut flowers and foliage—table 10 feet by 4½ feet. Only sixteen dishes of fruit selected from a given list were allowed; plate, silver, and cut glass excluded. The fruits were to be judged according to the R.H.S. Code, and the maximum number of points for flowers and foliage to be 8, for harmonius blending of colours 10, for general arrangement for effect 10. The sum of £45 was offered in five prizes, in exact accordance with the point value of each collection as awarded by the judges under R.H.S. Code. Three competitors entered for this, with the result that Mr. J. McIndoe secured the chief award with a beautiful table, his decoration consisting of carnations, odontoglossums, and montbretias. Mr. McIndoe's fruit consisted of the following: Spencer and Pineapple nectarines, Stirling Castle and Violette Hative peaches, Margaret Marillat and Souv. de Congres pears; Muscat of Alexandria, Chasselas Napoleon, Black Duke, and Madresfield Court grapes; Yorkshire Beauty and McIndoe's Best of All melons; Gascoyne's Scarlet and Washington apples; Moorpark apricots; and Brown Turkey figs. The marks awarded were: Apples, 7 and 6; apricots 5½; figs, 5; black grapes, 8½ and 8; white grapes, 7 and 8; melons, 5 and 5; nectarines, 8 and 5½ (Spencer gained full marks); peaches, 7 and 6; pears, 6½ and 6; beauty of flowers and foliage, 5; harmonious blending of colour, 7; general arrangement for effect, 8½; total, 124½; prize, £12 9s., or two shillings per point. Mr. Goodacre came second with 119 marks—£11 18s.; Mr. J. Edmonds, Bestwood, third with 100 points—£10.

The Garden Produce class was a novelty, and as such attracted a good deal of attention; it was for six dishes of fruit, six dishes of vegetables, and table plants and cut flowers, the whole arranged for effective display. Five prizes were awarded according to the point value of the exhibit, £25 being disbursed. The object of the class is to enable cultivators of gardens to show what they consider the best examples of varied products, such as are required in high-class gardens—this object was obtained in a measure. Mr. Goodacre, Elvaston Castle, came first, and in his collection were huge bunches of Barbarossa and Muscat grapes, Golden Eagle peaches, and cauliflowers; neat crotons, smilax sprays, carnations, and a few light orchids forming the decorating material. The points were allotted as follows: Black grapes, 8½; white grapes, 7 and 6½; peaches, 6½; nectarines, 5; apples, 6½; melon, 7; table plants, 7; cut flowers and foliage, 8½; tasteful arrangement, 8½; potatos, 6; tomatos, 4½; cauliflowers, 5; cucumbers, 4; peas, 6; and runner beans, 5½; total, 102 points, and this, at one shilling and fourpence per point, amounted to £6 16s. Mr. J. McIndoe came second, gaining 40 points for fruit, 33½ for vegetables, 5 for plants, 7½ for cut flowers and foliage, and 7½ for arrangement; total 96½, valued at £6 8s. 8d. Mr. Wilkins, Henstridge, third, with 38½ points for fruit, 36 for vegetables, 6 for plants, 5 for flowers and foliage, and 5 for arrangement; total, 90½, valued at £6 1s. 4d. Mr. Bremmell, gardener to T. France Hayhurst, Esq., fourth, with 83 points=£5 10s. 8d.

FRUIT.

There were three entries in the class for a collection of fifteen dishes of fruit, in fifteen varieties, and not less than ten kinds. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston, Derby, gained the first prize of £15, with finely finished bunches of Muscat of Alexandria, Cannon Hall Muscat, Gros Maroc, and Alnwick Seedling grapes, William's Bon Chretien pears, Moor Park apricots, Royal George peaches, Lord Napier nectarines, very fine; Brown Turkey figs, Lady Sudeley apples, Hero of Lockinge, and Duchess of York melons, and Cayenne and Queen pines; Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., Guisboro, Yorks, was second; and Mr. J. Edmonds, gardener to the Duke of St. Albans, Bestwood, Notts, third. In the class for a collection of nine dishes of fruit in as many varieties, there were five competitors, and Mr. J. Jones, gardener to Mrs. F. Need, York House, Malvern, secured first prize, with fair Madresfield Court and Muscat of Alexandria grapes, Violette Hative and Grosse Mignonne peaches, Moor Park apricots, Brown Turkey figs, Spencer and [illegible] Elruge nectarines, and Ne Plus Ultra melon; Mr. Bannerman, gardener to Lord Bagot, Blithefield, Rugeley, second; and Mr. A. MacCulloch, gardener to W. S. Webb, Esq., Newstead Abbey, Notts, third, his set containing [illegible] Pineapple nectarines. Mr. Grindrod secured the first prize for a collection of fruit produced with the aid of Icthemic guano, and offered of the Ipswich firm; peaches, nectarines, white and black grapes, and melons were all in fine condition: Mr. Huxter, second.

The best collection of nine dishes of fruit grown in the county of Shropshire was shown by Mr. C. Roberts, gardener to Miss Wright, Halston Hall, Oswestry, who had fine Sweetwater and Gros Maroc grapes, peaches, nectarines, figs, [illegible], pears, and a melon; there were six collections. Mr. J. Langley, gardener to the Rev. F. M. Bulkeley Owen, Tedsmore Hall, Felton, second; and Mr. T. Bremmell, gardener to H. H. France Hayhurst, Esq., Oberley, Wellington, third.

For plums, Mr. J. McIndoe was first with Early Transparent Gage; Mr. J. Langley, second; and Mr. J. Howard, third. Out of two dozen dishes of apricots, the best dish came from Mr. R. Grindrod, gardener to G. T. Bates, Esq., [illegible], who had splendid fruits of Early Red; Mr. J. Howard, gardener to Sir R. Sutton, Newbury, second; and Mr. C. Crooks, gardener to the Dowager Lady Hindlip, Droitwich, third. Mr. J. Howard had the best dish of nectarines, Pineapple, in first-rate condition; there were thirteen dishes. For a dish of peaches, Mr. J. Bowerman, Hackwood Park, was first with Barrington; Mr. W. Iggulden, Frome, Somerset, second, with Sea Eagle; and Mr. Goodacre, third. Mr. Goodacre scored for cherries, and Mr. Bennett, Market Drayton, for cooking apples; Mr. Dawes, gardener to Lord Trevor, Brynkniatt, was first for dessert apples with Beauty of Bath. For a collection of the hardiest of fruits, Mr. H. Huxter, gardener to T. B. Wood, Esq., Ludlow, was first, showing splendid gooseberries, currants, raspberries, cherries, &c.

GRAPES.

There were something like four hundred entries in the large number of grape classes provided. Not all these fulfilled their entry, but there was such a display of grapes as is probably not seen elsewhere in the United Kingdom. The best four bunches of black grapes were exquisitely finished, and large clusters of Black Hamburgh, and Madresfield Court, shown by Mr. J. Campbell, gardener to C. E. Newton, Esq., Mickleover Manor, Derby; there were eight entries, all good; Mr. J. Langley scoring a second with Black Hamburgh and massive bunches of Gros Maroc; Mr. G. Davies, gardener to the Rev. F. Alderston, Welsh Frankton, third. For four bunches of white grapes, two varieties, there were seven entries of splendid fruit, and Mr. J. Campbell, gardener to C. E. Newton, Esq., Mickleover Manor, was first with lovely bunches of Canon Hall and Muscat of Alexandria grapes, finely berried, and grandly coloured; Mr. T. Lambert, gardener to Lord Harlech, Brogynhyn, second, his Foster's Seedling being good; Mr. A. Kirk, gardener to J. T. Paton, Esq., Alloa, third.

There were fourteen sets of Black Hamburgh grapes, the best pair coming from Mr. J. Campbell, fine bunches with large berries; Mr. D. Airdrie, gardener to J. H. N. Graham, Esq., Stirlingshire, second; and Mr. J. Jones, Malvern, third. Mr. J. Jones, Malvern, secured first prize for a pair of bunches of Madresfield Court grapes, medium sized, but large berried bunches; Mr. J. Campbell second; and Mr. L. Barlow, gardener to F. R. Fremlow, Esq., Market Drayton, third. For a brace of bunches of Gros Maroc Mr. J. Campbell was again first, and Mr. A. Kirk second. The best pair of bunches of Muscat of Alexandria grapes were shown by Mr. W. Pilgrim, gardener to Sir G. Meyrick, Bart., Badorgan, beautifully coloured; Mr. J. Campbell second; and Mr. J. Skitt, gardener to Mrs. H. Bright, Liverpool, third.

VEGETABLES.

Vegetables were splendid, notwithstanding the long deferred rain, and they also were plentiful, filling a large tent. No less than nine competitors entered for Messrs. Sutton and Sons' prizes, offered for a collection of vegetables, and the first prize was grandly won by Mr. W. Pope, the Earl of Carnarvon's gardener at Highclere Castle, his magnificent collection consisted of Solid White celery, Magnum Bonum cauliflowers, Prizetaker leeks, Supreme potatos, Perfection tomatos, Best of All runner beans, Duke of Albany peas, Ailsa Craig onions, and Sutton's New Red carrots; Mr. R. Lye, gardener to Mrs. Kingsmill, Sydmonton Court, was a splendid second, the Ailsa Craig onions being grand; Mr. J. Bowerman, Hackwood Park, third; and Mr. T. Wilkins, gardener to Lady T. Guest, Inwood House, Henstridge, Blandford, fourth.

Five competed for Messrs. Webb and Sons' prizes for a collection of vegetables, and the chief winner was Mr. J. Bowerman, gardener to C. H. Hoare, Esq., Hackwood Park, Basingstoke, who showed splendid Ailsa Craig onions, Regina tomatos, Early Mammoth cauliflowers, Enterprise peas, Prizewinner carrots, Eclipse runner beans, Satisfaction potatos, and Webb's Giant celery; Mr. Pope, second; and Mr. R. Lye, Sydmonton Court, third. Messrs. Jones and Sons, Shrewsbury, also offered prizes for a collection of vegetables, and in a strong competition Mr. J. Birch, Shrewsbury, came first, and Mr. R. C. Townsend, second. The first prize, offered by the Icthemic Guano Company, Colchester, for a collection of vegetables, was won by Mr. H. Huxter.

Six exhibitors competed for the prizes offered by Messrs. Carter and Co., Holborn, for a collection of vegetables, and the first prize winner was Mr. W. Pope, gardener to the Earl of Carnarvon, Highclere Castle, who showed Jersey Lily turnips, Perfection beet, Holborn Reliance potatos, Duke of York tomatos, Elephant runner beans, Model Telegraph peas, Early Autumn Giant cauliflower, Bearer celery, Holborn Model leeks, Holborn onions, Model cucumbers, and Scarlet Perfection carrots. Mr. C. J. Waite, gardener to Sir P. Talbot, Esher, was a good second, his Satisfaction potatos and Perfection tomatos being especially fine. Messrs. Pritchard and Sons' prize for a dozen dishes of potatos was won by Mr. J. Darnell, gardener to R. L. Kenyon, Esq., Pradoe, Oswestry, his best examples being Come to Stay, Up-to-Date, Early White Don, Her Laddie, and Cole's Favourite; Mr. G. Davis, West Felton, second. For nine autumn onions, Mr. G. Risbrow, gardener to Colonel Kenyon, Slaney, was first; and Mr. B. Ashton, gardener to the Duke of Lathom, second. For spring-sown onions, Mr. R. Lye was first.

Mr. Wilkins had the best carrots, Sutton's New Red; Mr. R. Lye the best parsnips, Tender and True; Mr. J. Abbott the best celery; and Mr. J. Birch the best cauliflowers, Carter's Giant. There were thirteen dishes of runner beans, the best being a fine straight lot from Mr. J. Durnell; Mr. G. Risbrow second. Of French beans there were also thirteen dishes, Mr. R. C. Townsend coming first with selected Canadian Wonder; Mr. R. Lawley second, with the same variety. Peas were moderately good, Mr. B. Ashton, gardener to the Earl of Lathom, Ormskirk, coming first; and Mr. W. Pope, gardener to the Earl of Carnarvon, coming second. Out of fifteen brace of cucumbers Mr. Lawley's Peerless was selected as the best, and they were a splendid pair; Mr. Pope second, with Prizewinner. Tomatos were best shown by Mr. A. Hall and Mr. Stevenson. Mr. C. J. Waite, gardener to Sir P. Talbot, Glenhurst, Esher, was first for a dish of potatos, showing beautifully clean and handsome tubers of Windsor Castle; Mr. Lye second, with Satisfaction. The best collection of three varieties of potatos came from Mr. J. J. Brewin, Birkenhead, who had Mrs. Bresee, Cigarette, and International. For a collection of six varieties of potatos Mr. B. Ashton was first; and Mr. H. Forder, gardener to Colonel W. Cornwallis West, second, with splendid lots of clean and smooth potatos.

In the classes provided by Mr. R. Sydenham, Birmingham, the chief prizewinners were: Mr. R. Lye, for celery; Mr. Pope, for tomatos; Mr. Cruckney, Whitchurch, for peas; Mr. Durnell, for carrots; and Mr. Dawes, for onions. The whole of Mr. Sydenham's classes provided a capital display, but we have not space to detail them; the fine silver cup awarded to the competitor winning the most points goes to Mr. Pope this year. In Mr. Murrell's class the chief prizewinners for a collection of vegetables were Mr. R. C. Townsend; Mr. J. Birch, Shotton Hall; and Mr. J. Robinson, Brampton Brian. In another of the classes provided by Mr. Murrell, of Shrewsbury, Messrs. Abbot, Swain, and Chaunt gained prizes in the order given.

MISCELLANEOUS EXHIBITS.

Messrs. W. and J. Birkenhead, Sale, Manchester, put up a splendid lot of ferns, all pretty specimens in small pots; choice hardy ferns were conspicuous, and some especially good forms of Polypodium cambricum attracted attention. Warmth-loving exotics were also largely represented, davallias, gymnogrammas, aspleniums, and adiantums being especially plentiful. Mr. Deverill, Banbury, put up splendid bunches of hardy herbaceous flowers, including a very fine coreopsis that is even more graceful than C. grandiflora. Mr. J. Forbes, Hawick, sent some beautiful pentstemons and bunches of herbaceous flowers, also a brilliant set of cactus and show dahlias, and carnations, including a fine group of the popular Yuletide. Messrs. Dickson, Chester, had a large display, consisting of handsome trusses of zonal pelargoniums, highly-coloured dracænas and crotons, some choice conifers, bouquets, &c., all tastefully disposed in a long bank. Messrs. E. Webb and Sons, Stourbridge, had a huge show of good tuberous begonias, representing a fine strain; a collection of sweet peas, a few bunches of hardy flowers, and a splendid lot of gloxinias, selfs, shaded, and spotted forms of high quality. Mr. S. Mortimer, Farnham, Surrey, set up nine stands of dahlias, show and cactus varieties, all fine blooms, large and bright. Mr. Edwin Murrell, Shrewsbury, showed a fragrant and bright collection of cut roses, Mrs. J. Laing, Marchioness of Londonderry, and Prince Camille de Rohan being especially good; cannas and palms made a fine background.

Messrs. F. Sander and Co., St. Albans, showed a goodly lot of Dracæna Sanderiana, the quaint Acalypha Sanderi, Dendrobium biggibum, Rex begonia, and some of their new sonerilas and caladiums. Messrs. Pritchard and Sons, Shrewsbury, staged an extensive and interesting collection of cacti and succulent plants of various kinds, also liliums, gladioli, &c. From Worcester, Messrs. R. Smith and Sons showed a handsome group of plants, tastefully arranging fine specimens of campanulas, coprosma, liliums, choice conifers, &c.; a very bright exhibit. Mr. J. H. White, Worcester, had a bright group of gladioli, hedychiums, cannas, crotons, hardy flowers, &c. Tuberous begonias were extensively displayed by Mr. B. R. Davies, Yeovil, who had freely-flowered specimens of choice single and double varieties. Mr. Edwards, of Sherwood, staged fancy fern baskets. Mr. Hartland, Cork, had a large display of wonderfully fine begonia blooms, arranged flatly on moss, in boxes, an arrangement necessitated, perhaps, by the distance they have to travel, but nevertheless not a nice method. Mr. H. Eckford, Wem, Salop, put up a beautiful collection of sweet peas, the fine, handsome, and fragrant blooms on long stalks being lightly and tastefully displayed in tall, clear glass vases. Mr. Pattison, Shrewsbury, made a good show with violas. Broad beans of various kinds and sizes were staged by Messrs. Harrison and Sons, Leicester. Mr. W. Sydenham, Tamworth, showed violas in good condition, the deep yellow Pembroke being finely represented. Messrs. Jarman and Co., Chard, had a miscellaneous display of plants and flowers.

Messrs. H. Cannell and Sons had one of the most attractive of non-competing exhibits, this consisting of finely-grown cannas in small pots, all carrying splendid spikes of magnificent flowers; L. E. Bally, Queen Charlotte, Aurora, and Beauté Poitevin were grandly coloured. The Jadoo Company, Exeter, had a large group of plants—very many kinds—that had been grown in the jadoo fibre. Gladiolus in great beauty and variety came from Colchester, shown by Messrs. R. Wallace and Co.; this firm also staged liliums and fifteen varieties of montbretias.

MEDALS.

Gold Medals were awarded to Messrs. W. and J. Birkenhead, The Jadoo Company, Messrs. Pritchard and Sons, Mr. Murrell, Messrs. Wallace and Co., Messrs. F. Sander and Co., Mr. M. Campbell, Messrs. Webb and Sons, Messrs. Hartland and Sons, and Mr. H. Eckford.

Silver Medals to Messrs. R. Smith and Co., Mr. Myers, Messrs. Dicksons, Chester; Mr. J. H. White, Mr. Deverill, Messrs. Jarman and Co., and Mr. B. R. Davies.

Bronze Medals to Mr. S. Mortimer, Messrs. Jones and Sons, Mr. W. Sydenham, Mr. Pattison, Messrs. Harkness and Sons, and Mr. J. Forbes, Hawick.

First-class Certificates were awarded to Messrs. Dicksons, Chester, for Dracæna Crippsi; and to Mr. P. Blair, Trentham, for Carnation Trentham Rose, a glorified Ketton Rose, and a good border variety.

TAUNTON HORTICULTURAL SOCIETY, August 11.

TAUNTON was favoured with a splendid day when it made holiday on the occasion of its annual flower show. The weather was magnificent, the Vivary Park in the best condition, and the spacious white tents, six or seven in number, formed a huge camp upon the green grass. With the exception of fruit and vegetables and some of the cut flower classes, the entries were very heavy, and some of the plants—the fuchsias in particular—had to be placed in the open air. The cottagers' tent, in which the vegetable classes were staged, was a remarkable sight. In the whole of the twenty classes the entries ran into double figures; most of them ran into the thirties, and one reached over forty. The judges said that the vegetables produced by cottagers were equal to those shown by the gardeners who are among the leading growers and exhibitors of high-class vegetables. There was an enormous throng of visitors; the streets of Taunton, as well as the show ground, were crowded with human beings.

SPECIMEN PLANTS.—It is rarely there is an entry of five collections of stove and greenhouse plants in flower, but it was so in the Somersetshire town. Mr. James Cypher, nurseryman, Cheltenham, was first with a grand lot, large, even specimens, finely grown and bloomed. He had Statice profusa and intermedia; Ericas Austiniana, Turnbulli, Fairieana, and Aitoniana, all superb examples; Ixora Duffi, Allamanda nobilis, Stephanotis floribunda, Bougainvillea glabra, with two others. Mr. W. Finch, Coventry, was second, with a very good selection; his chief specimens were Allamanda grandiflora, Statice profusa, Rondeletia speciosa major, a fine Erica ampullacea, and others in proportion. Mr. A. Rowland, gardener to W. W. Brock, Esq., Exeter, was third. With six specimens Mr. Cypher again took the lead; he had grand examples of Ericas Austiniana and æmula Statice intermedia, Stephanotis floribundi, Bougainvillea Sanderiana, and Ixora salicifolia. It is sometimes said there are no large specimen plants to be found in the country, but they could be seen at Taunton.

In the amateurs' division, Mr. Thomas, gardener to W. G. Marshall, Esq., Taunton, was first with good specimens, such as those already named; Mr. Rowland was second; and Mr. Peel third; but, in the class for six plants, Mr. Rowlands took the first prize, and Mr. Thomas was second. The best newly-introduced plant was Acalypha Sanderi; Mr. Cypher was second with the same. The best specimen stove plant was Clerodendron Balfourianum, a good plant from C. E. I. Esdaile, Esq., Cothelstone (Mr. T. Essex, gardener); Mr. T. Tidbury was second with Stephanotis floribunda. Mr. S. Kidley, gardener to W. A. Sandford, Esq., Wellington, had the best specimen greenhouse plant, a fine piece of Dasylirion acrotrichum; Mr. W. Finch was second with a nice plant of Erica Marnockiana. Mr. Essex had the best fern, a fine example of Adiantum fragrantissimum; Mr. W. Day, gardener to E. W. Hill, Esq., Wembden, was second with Alsophila australis. Specimen lycopodiums and fuchsias were also shown, of the former a fine piece of densa carried off the first prize. It came from the Rev. J. D. Pring. Mr. Thomas staged the best four orchids. He had a fine specimen of Epidendrum prismatocarpum, Cypripedium Rothschildeanum and Cattleyas gigas and Rex, a very good quartette for this season of the year; Mr. J. Cypher was second. He had Cattleyas gigas and Gaskelliana, Lælia crispum, and Vanda cærulea.

SOFT-WOODED PLANTS.—Begonias in eight specimens were shown in the best condition by Mr. Thomas; Mr. H. Godding was second. There were some well-grown zonal pelargoniums in two classes, and also single specimens, and these classes were repeated in the amateurs' division. Fuchsias were in the form of fairly well-grown and flowered bushes, but some way removed from the Trowbridge form.

GROUPS OF PLANTS, arranged for effect, had a tent allotted to them, and they were seen to much better effect than heretofore, while greater scope for artistic effect was secured. In the open class Mr. Rowland was first with a very effective arrangement, bright foliage plants and flowers, with ferns, &c., being well grouped; Mr. W. Finch was second; and Mr. Peel third. In the amateurs' division, with a smaller group, Mr. Rowland was again first, and Mr. Thomas second. Gloxinias and achimenes made bright patches of colour in the amateurs' tent, Mr. Thomas taking the first prize with gloxinias, and Mr. T. Essex with achimenes. There were classes also for balsams, petunias, and cock's-combs.

FINE FOLIAGE PLANTS AND FERNS.—In the open class for eight fine foliage plants some splendid specimens were staged, Mr. James Cypher taking the first prize with Kentias Forsteriana, Belmoreana, and australis; Latania borbonica; and crotons Queen Victoria, augustifolium, Chelsoni, and Flambeau; Mr. Finch was second, his leading plants being a fine Cycas revoluta, Latania borbonica, and croton Queen Victoria; Mr. W. Vause, Leamington, was third. In the amateurs' division Mr. Peel was first, with six fine foliage plants, as he was also with four stove and greenhouse plants in flower; Mr. Rowland taking the second prize in both instances.

CUT FLOWERS are always a strong feature at Taunton, but owing to the lateness of the season there was a very poor display of asters, which are generally very finely shown; roses also were not so numerous as usual. The best thirty-six roses in the open division came from Mr. J. Mattock, Oxford, who had excellent blooms of Alfred Colomb, Mrs. J. Laing, Dupuy Jamain, Duke of Teck, Maréchal Niel, Medea, A. K. Williams, Ulrich Brunner, Charles Lefebvre, Her Majesty, L'Eclair, Marie Baumann, Beauty of Waltham, Niphetos, &c.; second, Mr. Thomas Hobbs, Bristol. With eighteen varieties Mr. Mattock was again first, his leading blooms L'Eclair, Laurence Allen, a desirable new variety; Marchioness of Londonderry, Horace Vernet, Mrs. W. J. Grant, Comte Raimbaud, and Maréchal Niel; Messrs. Jarman and Co., Chard, were second. Mr. Mattock also had the best box of eighteen teas, chief among them excellent blooms of Maman Cochet, Maréchal Niel, Ernest Metz, The Bride, Medea, Madame Cusin, Innocente Pirola, Souvenir de S. A. Prince, and Catherine Mermet; Dr. Budd, Bath, was second. In the amateurs' division for twenty-four and twelve varieties of roses, and also for twelve teas, Dr. Budd was first in each of these classes, and Mr. T. Hobbs second.

Dahlias showed the lateness of the season. The best stand of twenty-four show varieties came from Mr. G. Humphries, Chippenham; Messrs. Jarman and Co. were second. The former took the first prize for twelve fancy varieties, and also for six cactus varieties. Mr. J. Burgess, Kingswood, had the best six bunches of single dahlias. Mr. Humphries was also first with nine bunches of pompon dahlias; the Rev. M. Branckner was second. Mr. T. Hobbs was first for show and fancy varieties in the amateurs' division, and Mr. Burgess for singles. Mr. McAllister was first for cactus varieties.

FRUIT was scarcely up to the Taunton standard on this occasion either in quality or quantity. There were two collections of eight dishes. Mr. W. Strugnell, The Gardens, Rood Ashton, was first with Alnwick Seedling and Foster's Seedling grapes, Alexander Noblesse peach, Stanwick Elruge nectarine, Negro Largo fig, Moor Park apricot, and Governor Wood cherry; Mr. Crossman, gardener to J. Brunton, Esq., Yeovil, was second with Madresfield Court and Buckland Sweetwater grapes, Dymond peach, Pine Apple nectarine, and others. Mr. Mitchell, gardener to J. W. Fleming, Esq., Romsey, was first with four dishes, having Madresfield Court grapes, Dymond peach, Pine Apple nectarine, and a melon; Mr. Crossman was second. Mr. Mitchell had the best three bunches of Black Hamburgh grapes, large and well-finished; Mr. Wilkinson, gardener to T. W. Greaves, Esq., Bristol, was second; and Mr. W. A. Todd, third. Mr. Mitchell had the best three bunches of any other black, staging good Madresfield Court; Mr. W. McAdam Smith (Mr. C. Cooper, gardener) was second with Alicante. The best two bunches of White Muscats also came from Mr. Mitchell; the Rev. T. Greaves was second. The first prize three bunches of any other white were Buckland Sweetwater from Mr. W. A. Todd; the Rev. T. Greaves was second with Buckland Sweetwater. Melons were fairly well shown. The best peach was Sea Eagle, very fine fruit, coming from the Frome Fruit and Flower Company; Mr. Mitchell was second with the same. Some very good apricots were shown for the season, chiefly Moor Park. Mr. F. M. Newton took the first prize, and Mr. R. C. Trevillian the second. The best dish of nectarines was Pine Apple from Mr. S. Kidley; Mr. J. Webber, gardener to G. F. Luttrell, Esq., Dunster Castle, was second with Lord Napier.

VEGETABLES were in great quantities, especially in the cottagers' tent, where there was a remarkable display of high quality produce. The first of Messrs. Sutton and Sons' special prizes was won by Mr. T. Wilkins, The Gardens, Henstridge, with a very fine collection. Major Aldworth was second, and Mr. W. A. Sandford third. Major Aldworth took the first prizes offered by Messrs. Webb and Sons. The Mayor of Taunton also offered prizes for a collection. Mr. J. Priscott, Selworthy, was first, and Mr. J. Jones, Dunster, second.

Many fine miscellaneous displays were staged.

SEVENOAKS HORTICULTURAL SOCIETY, August 10.

THE thirty-first exhibition of this society was held in Knole Park, near the town, the gardens also, by the permission of the Right Hon. Lord Sackville, being thrown open to the visitors. The park is noted for its extent and delightful undulations, and its magnificent trees, oak and beech in particular being of great size and splendid development. The day was scarcely favourable, for a blustering south-west wind, which occasionally freshened to a gale, severely tested the stability of the tents. Happily the rain held off, and there was a good company.

One long tent accommodated the main of the plants. One leading class was for six exotic flowering plants. Mr. A. Gibson, gardener to T. Barnaby Atkins, Esq., Halstead Place, was placed first, having very finely developed plants of Dipladenias insignis and Brearleyana, Clerodendron Balfourianum, Ixora Dixiana, I. Fraseri, and Anthurium Scherzerianum. Mr. A. Hutton, gardener to Mrs. Swanzy, Quarry, was second, having Allamandes Schotti and noblils, Gloriosa superba and Ixora Fraseri as his best specimens. Mr. Hutton came first with ornamental-foliaged plants, having Latania borbonica, [illegible] salicifolia, Cibotium princeps, Alocasia Thibautiana, Anthurium Veitchianum, and A. crystallinum. Mr. Gibson was second, palms and crotons being his leading subjects. The best specimen stove plant was a splendid grown and bloomed plant of Dipladenia boliviensis, from Mr. C. Sutton, gardener to Earl Stanhope, Chevening; Mr. Gibson taking the second place with Anthurium Scherzerianum. The best foliage plant was a very fine example of Alocasia Thibautiana, from Mr. Hutton; Mr. Gibson was second with Cycas revoluta. Fuchsias were in the form of nice bush specimens. The best six came from Mr. G. Cooper, gardener to H. Foster, Esq., Heppingham; Mr. H. Heath, gardener to Mrs. Petley, Riverhead, was second. There were some fair specimens of begonias. Mr. J. Talmage, gardener to Mrs. Hodgson, Hereward, had the best four; Mr. C. Noble, gardener to Miss Austen, Sevenoaks, was second. There were specimen zonal pelargoniums, and the best six came from Mr. Heath.

Groups of plants arranged for effect and also of ferns, in each case filling a space of 54 ft., were arranged alternately on one side of the principal plant tent, and produced an excellent effect. The best one of mixed plants came from Mr. C. Sutton, who had a background of palms and Gloriosa superba, with Campanula pyramidalis, Begonia corallina, carnations, crotons, &c., in the foreground; Mr. G. Fennell was second; and Mr. Hatton third. The best group of ferns was set up by Mr. Hatton, a most effective arrangement of good stuff; Mr. W. Hough, gardener to Mrs. Lambarde, Beechmont, was second; and Mr. Heath third. A few plant classes were also set apart for single-handed gardeners and amateurs.

The cut flower classes brought fine roses, Mr. Sutton having the best twelve, while Mrs. Seale, The Vine Nurseries, contributed the best twenty-four. Dahlias: Mr. A. Parks, Ivy Hatch, had the best twelve. Cactus and single dahlias were also staged; the best twelve blooms of Jaurezi came from Mr. A. Hoadly; Mr. E. Turner, Kippington, had the best twelve in six varieties. It seems quite time inferior decorative dahlias were banished from the exhibition table. Phloxes, gladioli, and asters were shown, but generally of poor quality, owing to the season.

Mr. Gibson had the best twelve bunches of cut flowers, orchids prevailing; Mr. W. Hough was second. There was also a class for twelve bunches of herbaceous subjects. Mr. Noble was first; and Mr. Fennell second. Mr. E. Hodgson, gardener to Miss Morphew, Sevenoaks, was first with six bunches of border carnations; and Mr. R. Edwards second.

Floral decorations consisted of tables, the best coming from Mr. S. Cook, the Gardens, Rosefield, a light and elegant piece of work; Mr. Fennell was second; Mr. W. A. Searing had the best centre piece; and Mrs. Searle the best basket of flowers. Buttonholes and dress sprays were also exhibited.

Our notes of the fruit classes are somewhat imperfect owing to the absence of the exhibitors' names. There was a class for six varieties of fruit in which good produce was staged; and also classes for black and white grapes. Mr. Osman, The Gardens, Ottershaw Park, had the best collection of three varieties, staging Alicante, Chasselas Napoleon, and Black Hamburgh grapes; Mr. W. Hough second with Muscat of Alexandria, Bowood Muscat, and Black Hamburgh. Barrington was the best peach, and Elruge the best nectarine. Plums, apples, and pears were weak.

Very fine groups of plants were contributed by Messrs. James Veitch and Son and J. Peed and Sons, both of the highest merit, and Mrs. Seale set up a collection of cut flowers, plants, &c., of equal merit. Mr. H. Cannell had a rare group of cannas; Messrs. W. Cutbush and Son a large group of plants; Mr. J. R. Box had sweet peas; and other contributions of lesser value were also exhibited.

BISHOPS STORTFORD, August 10.

THIS long-established and enterprising society held its annual exhibition on the above date, in the grounds of The Grange, the residence of John Barker, Esq., and proved, as usual, a splendid success in every respect. The Bishops Stortford Horticultural Society was founded in the year 1838, and it is evident its founders were not wanting in intelligence, for in the earliest of the schedules issued the executive stipulated that the fruit staged in competition for the prizes should become the property of the society, and form the dessert of the dinner arranged to take place in the evening at the close of the show. No more suitable place for the holding of a flower show could well be found within some miles of the town than the Grange gardens, for they are spacious, highly picturesque, and well kept, and from the higher parts widely extended views are obtained of the Stort valley. Some five or six huge marquees were provided for the accommodation of the products in competition for the prizes, and each one was filled to repletion with contributions that reflected much credit upon the taste and skill of the exhibitors. The two great features were formed by the table decorations and the begonias, and the former were so numerous and good that the spacious tent set apart for them might with justice be described as a veritable fairy land. It has been our good fortune to see many beautiful displays of table decoration, but in no instance have we seen one to equal that which formed such an attractive part of this exhibition.

GROUPS OF PLANTS constituted an important and highly attractive feature, and in the principal class there were seven entries, all of which were more or less meritorious. Mr. G. Barker, gardener to H. A. Blythe, Esq., Grinstead House, obtained premier honours with a superb arrangement which was broken up into a series of mounds by the tasteful disposition of richly coloured crotons and dracænas, feathery palms, and delicate tinted flowering plants, these mounds being carpeted by ferns and dwarf foliage plants. Mr. J. Richardson, gardener to Sir J. Blythe, Blythewood, Glanstead, was second with a group evincing much taste, in which the brilliantly coloured Clerodendron fallax was employed with good effect. Mr. W. Clarke and Mr. T. Lodge were awarded equal thirds, and deservedly so, for collections in which the white and blue forms of Campanula pyramidalis were conspicuous.

COLLECTIONS OF PLANTS included stove and greenhouse plants grown for their flowers or remarkable for the beauty of their foliage: begonias, pelargoniums, gloxinias, and a host of other things. The begonias constituted the chief feature of this section of the exhibition, the collections in the several classes being exceptionally well grown and sufficient to fill one side of an immense tent. W. Smith, Esq., the hon. secretary, was the principal exhibitor of these flowers, and occupied the post of honour in the class for a collection comprising about one hundred superbly grown plants, distinguished by the high quality of the flowers. Mr. E. Harris was second with a remarkably good collection. No finer baskets of begonias have yet been presented to public notice than those exhibited by Mr. Smith, who was awarded the first prize in the class for six baskets filled with choice varieties. Mr. Harris was successful in occupying the first place in one of the classes for six plants, having the whole of his plants splendidly flowered. Mr. Brown was first for three singles, and Mr. Parker obtained a similar honour for three doubles, and in each case the specimens were admirably grown, as were those from other exhibitors. Mr. P. Griggs occupied the post of honour in the class for six fuchsias with superbly-flowered bushes. Mr. Lodge was at the head of the competitors for the prizes for six stove and greenhouse plants in bloom of well known kinds. In the corresponding class for fine foliage plants, Mr. G. Barker was first. This exhibitor had also a grand collection of ivy leaved pelargoniums, the specimens trained in the form of pyramids about six feet high, and densely flowered. The finest of the several collections of six ferns were contributed by Mr. B. Calvert, gardener to Colonel Houblon, Mr. W. Clarke, and Mr. G. Beech, gardener to J. Barker, Esq., The Grange. Mr. G. Bowtell was successful in taking first prize for six single and for six double begonias, and had examples representing high-class cultural skill.

FLORAL DECORATIONS were contributed in sufficient numbers to form a large and highly attractive exhibition, and were throughout characterised by much taste. Miss Skeet and Mrs. F. Knight were first and second in the class for decorated dinner tables, and on which delicate sweet peas and the foliage of Acer Negundo variegata were arrayed with much taste. Decorated fireplaces formed a very attractive and interesting feature, and in the ladies' class Mrs. Joscelyn was first; and in that for gardeners Mr. Lodge obtained premier honours. Baskets of cut flowers and vases were also numerous and tasteful.

CUT FLOWERS were plentiful, and formed a large and attractive section, the cut flowers of hardy herbaceous plants being particularly noteworthy. For twenty-four kinds of hardy perennials Messrs. Paul and Son, Cheshunt, were first, with a magnificent collection, in which Acanthus longifolius, Echinops ruthenica, Coreopsis lanceolata, Centaurea macrocephala, a rudbeckia, Scabiosa caucasica, and other good things were represented; Mr. H. Bruce was second, with a capital collection. For twelve bunches Mr. Beech was first; and Mr. Watts second.

FRUITS AND VEGETABLES were plentiful and good. The best collection of eight dishes of fruit was that contributed by Mr. A. Handicomb, who had exceptionally good peaches and grapes; Mr. B. Calvert was second, also having a capital collection. Mr. Harris and Mr. Beech were the most successful of the exhibitors in the class for a collection of vegetables consisting of eight kinds. Vegetables were shown in enormous quantities by cottagers, and in a condition deserving of the highest praise.

MISCELLANEOUS CONTRIBUTIONS included a magnificent collection of roses and other objects from Messrs. W. Paul and Son, Waltham Cross, and a collection of roses from Messrs. Paul and Son, Cheshunt.

The arrangements were admirably carried out under the direction of Mr. W. Smith, who has occupied the position of honorary secretary during the past twenty-seven years.

THE WORKING MEN'S FLOWER SHOW.

THE thirty-fourth annual exhibition of plants belonging to the working classes of Edinburgh, grown in windows or small gardens, plots, back greens, and area gardens, took place at the Corn Exchange, Grass Market, Edinburgh, on Saturday. This society has had a long and useful career, working slowly and surely, more like the tortoise than the comet. It has succeeded in strengthening and extending the tone of horticulture among the crowded masses where its light and leading are so urgently needed, and where the plant or its flowers are almost the only thing of beauty that can be seen or felt amid this dreary, semi-hopelessness of their environments. In this age of children's gardens and examinations in horticulture in Board and other schools, with the establishment of geranium clubs with seven hundred members, all honour to this workmen's society of Edinburgh for providing special classes for children ranging from six to fourteen years of age. Unfortunately, the quantity and quality of the plants shown in some of the classes have seriously declined in recent years. Perhaps some special effort may be made before another show to offer some additional stimulus in such forms as the gift of seeds, plants, roots, and bulbs to the poorer classes and the young people from six to fourteen, who are specially invited to compete with each other in this show. Fuchsias, scented geraniums, ferns, mosses, succulents, and musks are perhaps the more popular plants. By some means, interest in these classes must be revived, as in not a few of these tenements—one can hardly call them homes—the bunch of flowers or living plants prove the most sanitary and ennobling agencies.

This working men's show, outside of these two classes, was a decided advance on that of last year. Some four hundred prizes were offered, for which a vigorous competition took place, especially in the classes for hardy ferns, window plants, window boxes, plants grown under glass, viz., outside dwelling houses, in plant cases. In the special class, open to all, of twenty aspidistras, the entries were rather limited. Aquatic or water plants are so rare at flower shows that it is interesting to note that a class was provided for them. Amid the few things shown not for competition was the fine collection of hardy violas, pansies, and other plants from Messrs. James Grieve and Sons, Redbraes Nurseries; with some beautiful object lessons in cultured taste in a striking exhibit of wreaths and crosses by Mrs. Cartright, Cannongate. There was a good attendance, and at three o'clock, in the unavoidable absence of the Lord Provost of Edinburgh, Professor Geddes took the chair to distribute the chief prizes in the presence of a large gathering. The Chairman, after heartily congratulating those present on the success of the show, referred to the larger places and greater power of horticulture in education in France, Germany, and other countries than among us. He then heartily congratulated the prize winners, and encouraged those who lost to try and win next time.

D. T. F.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

THE usual monthly meeting of this popular society was held at their rooms, 5, St. Andrew's Street, Edinburgh, on August 2, at half-past seven p.m. The Royal Arboricultural Society met on the morning of the same day in the same place at ten a.m., and some eighty members left for the Forest of Dean on their annual excursion at twelve p.m. As several are members of both societies some feared a thin attendance at night, but it almost seemed as if the more there were away the more came, and there was a large attendance, with the genial president, Mr. M. Todd, in the chair. Among a number of interesting exhibits was a nice dish of Richard Gilbert strawberry, raised and grown by Mr. Wm. Carmichael, Edinburgh, which excited much interest. Certificates of merit were awarded to Messrs. James Grieve and Sons for Britannia carnation, a very handsome rosy-pink border variety, and to Messrs. Dickson and Co. for their new yellow viola, Walter Welch. The paper for the evening was communicated by Mr. W. Boyd, late of The Glen, now of the Royal Gardens, Bellisle Age. It was on the general cultivation of orchids for cut flowers, dealing principally with such species as are of a decorative character, and the blooming season of which was during late autumn, winter, and spring. The paper was of a thoroughly practical character, showing Mr. Boyd to have a very comprehensive grasp of his subject, and revealing a minute knowledge of the cultural necessities of the various kinds brought under his view. A most interesting discussion ensued on the reading of the paper by the assistant secretary, and general pleasure was expressed that such a talented communication should have been given to the association by so young a man as this. Opinion was confidently expressed that Mr. Boyd, who has recently gone to his maiden situation as a head gardener, might soon take a place in the first rank. A very enthusiastic vote of thanks was awarded to the president for the successful manner in which he had planned and carried out the recent *bijou* rose show and strawberry festival. Fifteen more new members were proposed.

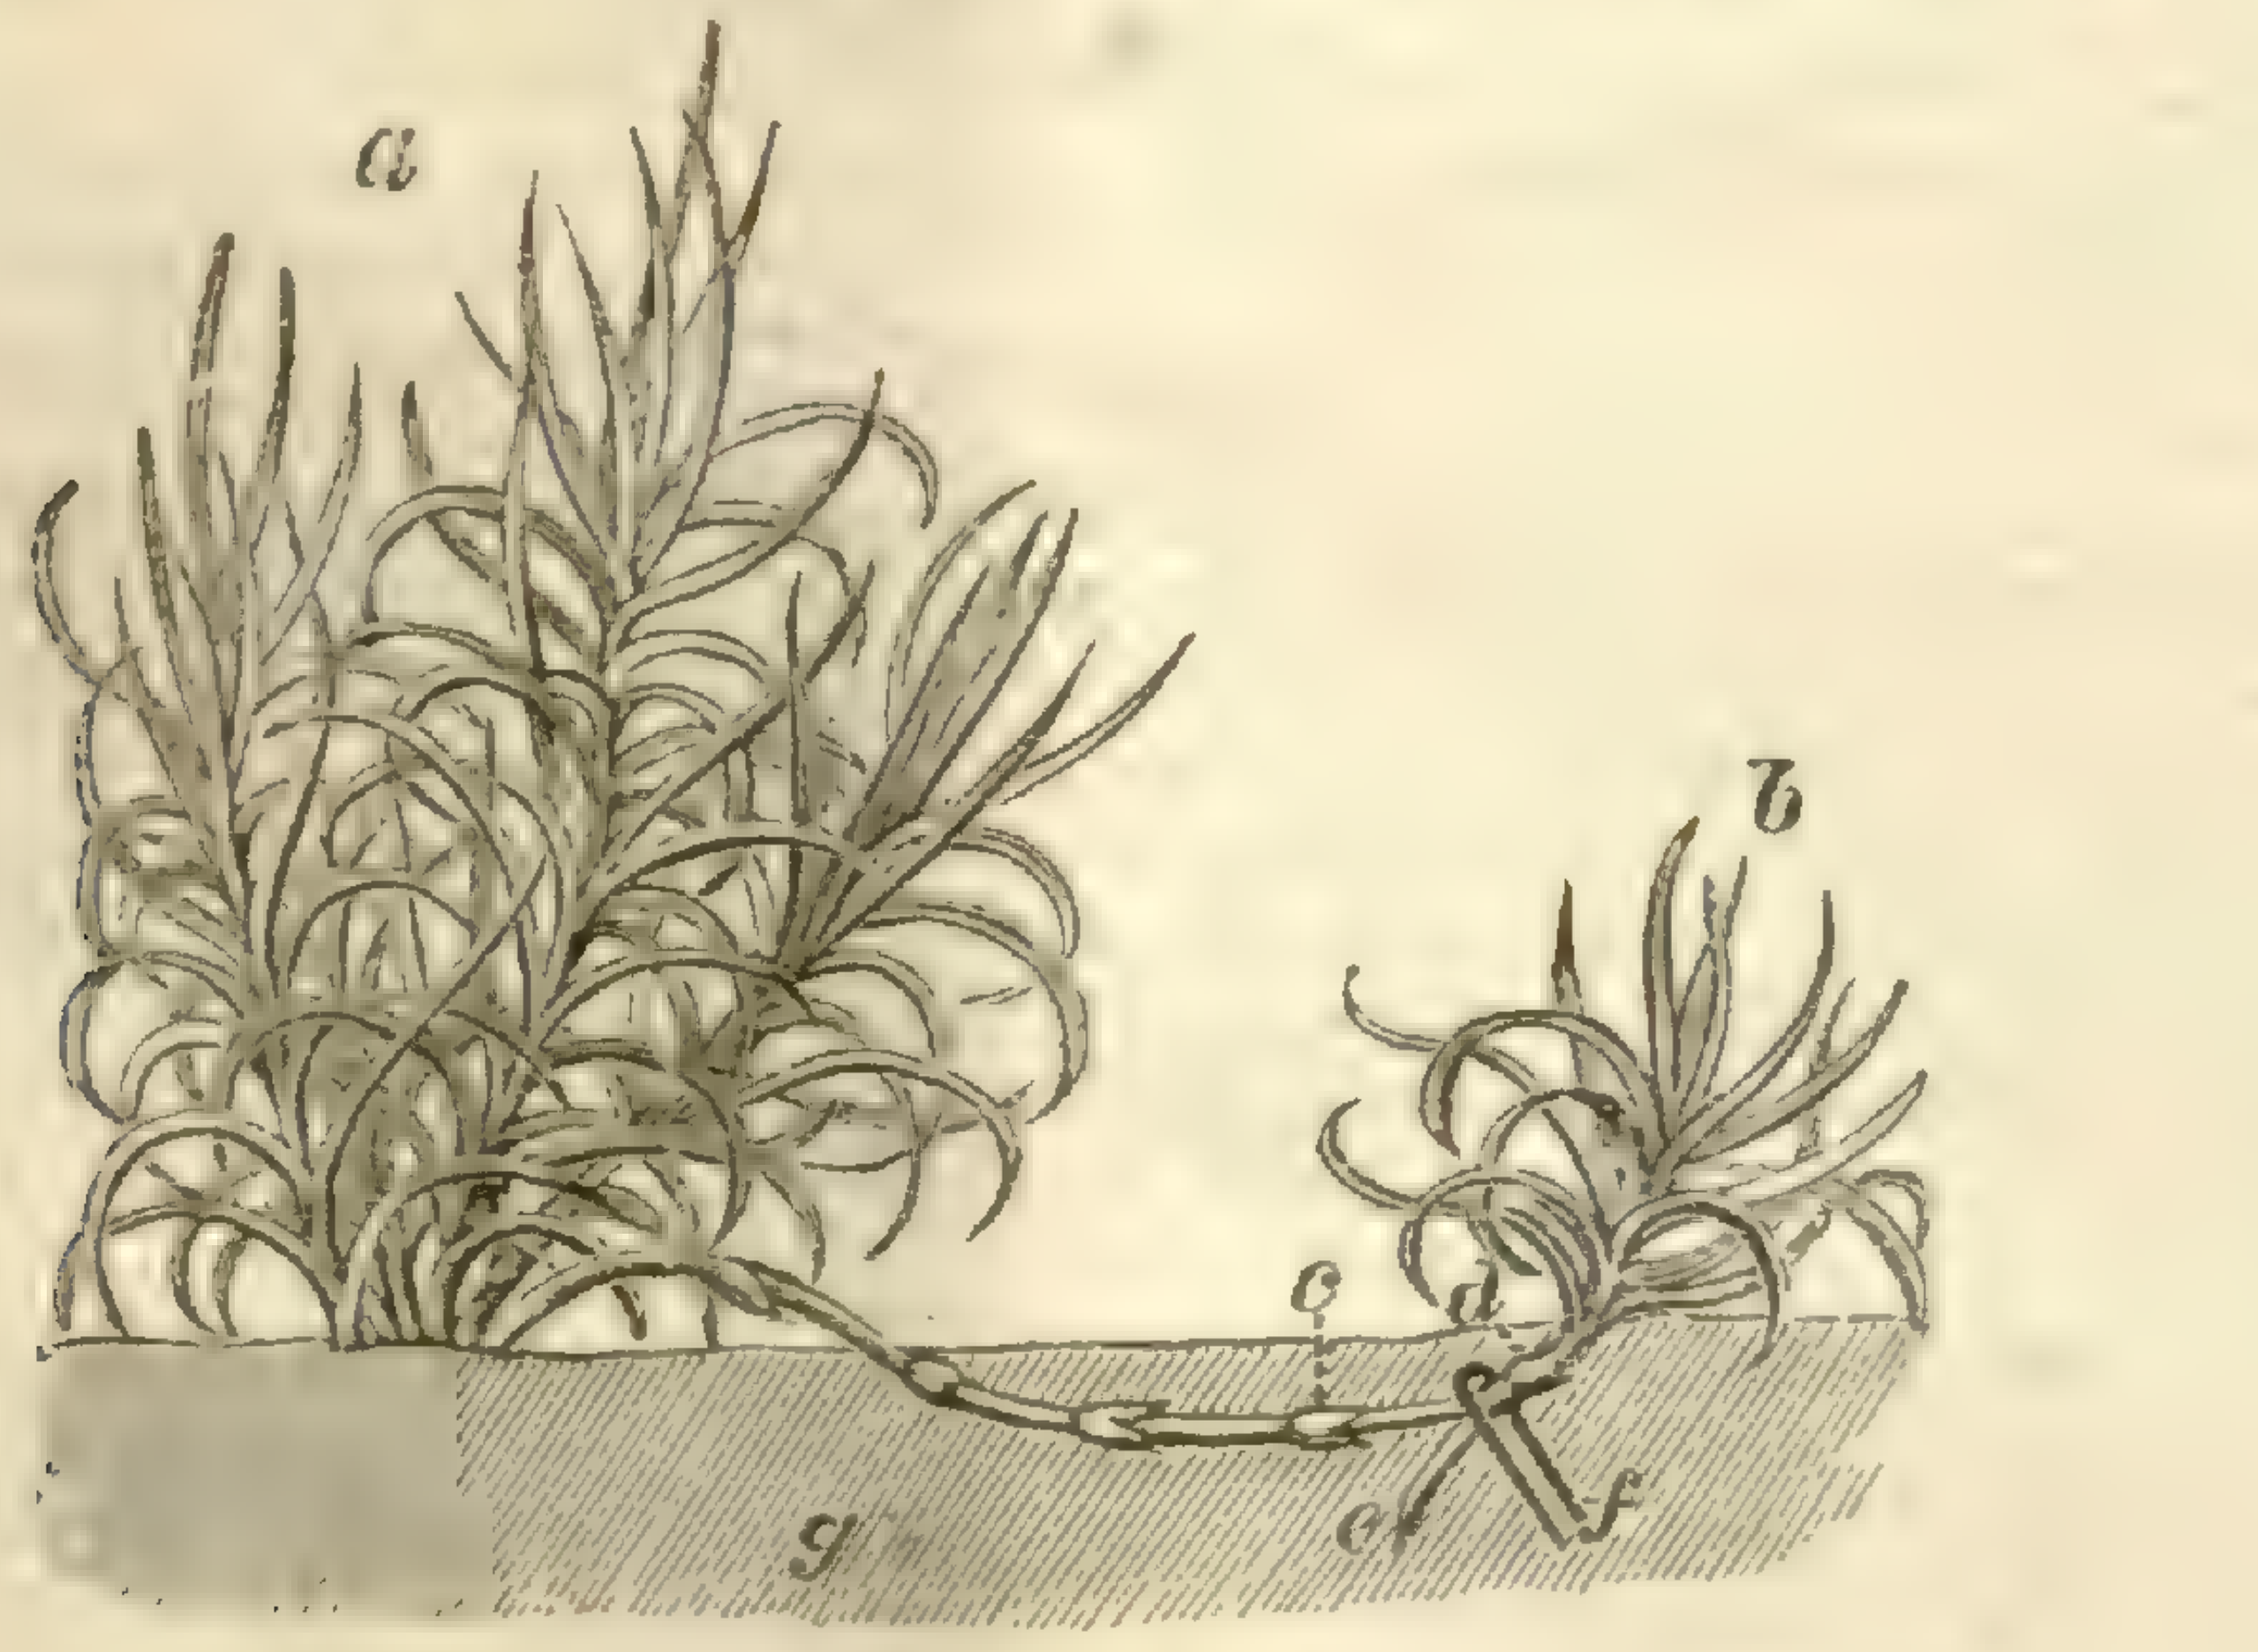
ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Seedling Dahlia.—E. W. B., Dulwich: The flower sent is a very good show variety, but whether it is distinct enough from the numerous existing varieties to prove valuable commercially is a matter not easy to decide, and certainly not to be decided upon one flower. The best means of ascertaining the distinctness of the variety will be to send or take a bloom to some nursery where dahlias are made a speciality, and institute a comparison between it and others of a similar colour. The names of the majority of dahlia specialists appear frequently in our advertising columns and in connection with Royal Horticultural Society and Royal Aquarium Shows. With regard to naming a florist's flower, that is a matter entirely in your own hands; you are at liberty to give it any name you please, but it is desirable not to give a name like any that already exist, consequently a comprehensive dahlia catalogue should be secured; Dulwich Hero or your own name might be given. Another way of quickly ascertaining the merit of this or any other florist's flower is to send three well-developed blooms, named, to a meeting of the Royal Horticultural Society, previously intimating your intention of exhibiting for an Award of Merit to Mr. S. T. Wright, superintendent R.H.S. Gardens, Chiswick, W. Unless you have some first-rate blooms to show it will be best to defer staging flowers till next year, so as to afford yourself an opportunity of specially cultivating the plants. If you gain an Award of Merit for the variety there will not be much difficulty in disposing of the stock to some nurserymen.

Layering Carnations.—E. K., Lincoln: There should be no delay in layering carnations, for in the majority of gardens the work has already been performed. If layers are not taken or made early, the young plants do not become properly rooted in time for their severance from the parent and planting out in their permanent quarters, so as to become established ere cold weather sets in. Layering is a simple operation, and, after a little practice, can be done very quickly; an expert can set a thousand layers a day. A sharp knife, some pegs or layering pins, and some light, fairly good and finely-sifted soil are the requisites for the work. Unless already moist, give the plants to be layered a good soaking overnight; loosen the surface soil with a hand-fork before commencing to layer.



Mode of Layering Carnations.

Strip the lower leaves from the base of the growth to be layered, and then insert the blade of the knife (as at *c* on the accompanying cut), from below, half way through them, and then cut lengthways and upward just into the next joint at (*d*). Keep the tongue (*e*) open, and then press the pin or peg (*f*) so as to fairly fix the layer, and bring the leafy growth (*b*) into an upright position. The next thing to do is to place some of the prepared soil around the layer so as to completely cover the cut portion of the stem. Press this firmly, and give water, if necessary. Instead of pressing the layer right into the bed (*g*) as in the cut, it is best to place it on the surface and then place the new soil about it in the form of a mound depressed at the top so as not to throw off all the moisture given.

Fruit Canning in California.—G. M. C., Plymouth: The most recent advices give the returns for 1897, and from these we gather that the exports of fruit and vegetables show a decline as compared with 1896. Prices were very low at the opening of the season, and stocks had run down to a minimum. Owing to the general revival of business and a partial failure of the fruit crop in the Eastern States, a heavy demand sprang up suddenly, and in July and August the sales of California canned fruit exceeded those made in any corresponding period. Prices advanced rapidly, and were well maintained to the end of the year. There were thirty-eight canneries in operation in California last year, and the following is an estimate of the output, given in cases: Tomatos, 348,000; asparagus, 81,500; peas, 30,000; beans and other vegetables, 8,500; pie fruit, 30,000; jams and jellies, 8,000; table fruits, 1,920,000; total, 2,426,000 cases. In the last five or six years the cost of the production of canned fruit has declined about one-third, owing to the fall in the price of most of the commodities used in its manufacture. Except in seasons of great scarcity of fruit these reduced prices are likely to be maintained, and this fact will no doubt be welcome in Great Britain.

Mr. Pulham, Sen., head of the firm of Messrs. Pulham and Sons, Broxbourne, died, we regret to state, on the 11th inst. Mr. Pulham was 78 years of age. The business will, we are informed, be continued under the old title.

MARKETS.

Covent Garden.

Fruit supplies are large, and the demand is steady throughout. Vegetables are plentiful and fairly cheap.

Fruit.—English apples, 4s. to 8s. per bushel; Dutch pears, 2s. to 3s. per molly; French, 3s. 6d. to 7s. 6d. per case; plums, 2s. to 3s. 6d. per case, 4s. to 5s. 6d. per half-sieve; greengages, 9d. to 1s. 3d. per box, 3s. 6d. to 7s, 6d. per half-sieve; English grapes, 1s. to 2s.; Jersey, 9d. to 1s. 6d. per lb.; Valencia, 6s. 6d. to 10s. 6d. per barrel; lemons, 10s. to 20s. per case; gooseberries, 1s. 6d. to 2s. 6d. per half-sieve; Spanish melons, 8s. to 12s. per case; French, 1s. to 2s. per crate; black currants, 5s. to 7s.; red, 4s. to 5s. per half-sieve; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 5s. each; peaches, 1s. to 6s. per dozen; French, 9d. to 1s. 3d. per box; green figs, 1s. to 2s. per dozen.

Flowers.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. to 2s.; red roses, 6d. to 1s.; cattleyas, 5s. to 8s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; asters, 2s. to 12s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; Pansies, 1s. to 2s.; pelargoniums (scarlet), 3s. to 5s. per dozen bunches; stephanotis, 1s. to 2s.; lily of the valley, 6d. to 1s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

Vegetables.—English tomatos, 3d. to 5d.; Jersey, 2½d. to 4d. per lb.; Spanish, 10d. to 1s. 3d. per box; cauliflowers, 1s. 6d. to 2s. 6d.; cucumbers, 1s. 6d. to 3s.; endive, 1s. to 1s. 6d.; marrows, 1s. 6d. to 3s. per dozen; lettuce, 8d. to 10d. per score; French beans, 2s. 6d. to 3s. 6d. per half-sieve; broad beans, 1s. to 1s. 6d.; peas, 2s. to 3s. per bushel; English onions, 2s. to 3s. 6d. per dozen bunches; Ports, 5s. to 6s.; Valencia, 5s. to 6s. per case; turnips, 3s. to 3s. 6d.; carrots, 2s. 6d. to 3s.; parsley, 2s. to 2s. 6d.; mint, 2s. to 2s. 6d. per dozen bunches; cabbages, 4s. to 4s. 6d. per tally; mushrooms, 6s. to 8s. per 12 lbs.; potatos, 60s. to 100s. per ton.

Borough Potato Market.

There are moderate supplies of potatos, and though prices have a downward tendency they have not quotably altered. English Snowdrop and Early Puritan, 3s. 6d. to 4s.; Beauty of Hebron, 3s.; and Sutton's Early Regent, 3s. 6d. to 4s. per cwt.

THE WEATHER DURING THE WEEK ENDING AUGUST 13, 1898.

The mean reading of the Barometer during the week at Greenwich was 29·83 inches, and that of the Thermometer 61°·9, the latter being 0°·6 below the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 2 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 35·6 hours. The measured rainfall amounted to 0·56 of an inch.

THE END OF THE CENTURY draws near, and somehow the fact impresses one and makes one think. On the threshold, as it were, of the twentieth century, we pause and take a glance back over the years that are gone. How much has happened during this [illegible] century! What wonders have been given to the world! The power and use of [illegible] telegraph—these and many others are the discoveries of the nineteenth century [illegible] will cause the closing century to stand out above all that have gone before and a [illegible] is the fact that in its earlier half was discovered a priceless blessing to mankind—[illegible] remedies—Holloway's Pills and Ointment.—[Advt.]

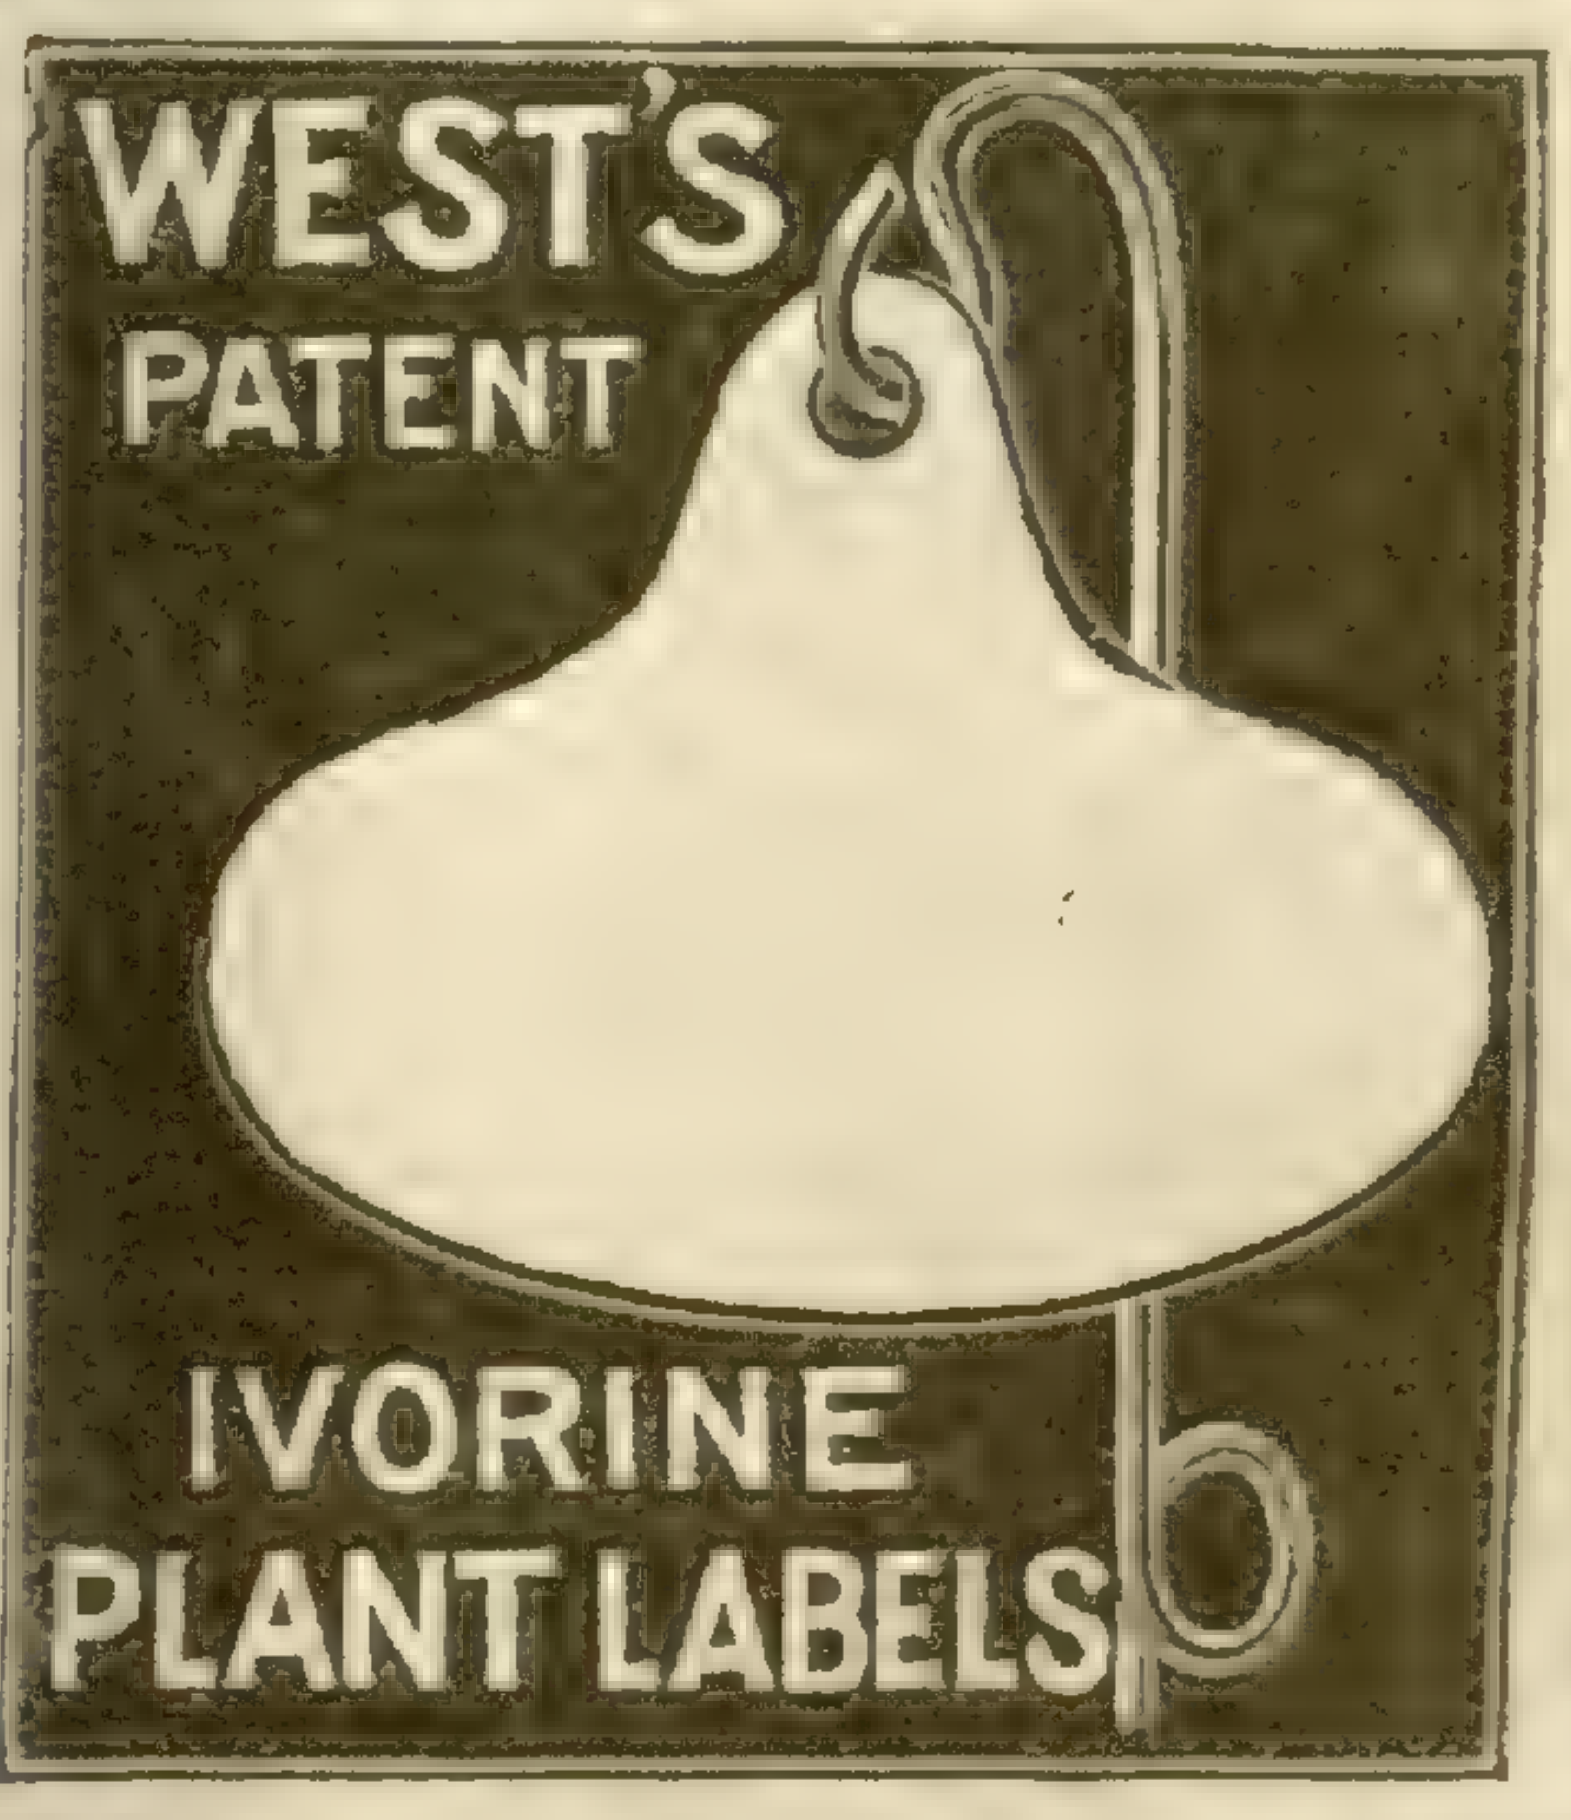
I DO NOT REQUIRE PAYMENT TILL YOU HAVE RECEIVED AND APPROVED OF THE NETTING.

From Hy. J. Gasson, Netting Works, Rye.



The "Ivorine Writing Disc, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

The Stourbridge HEATING APPARATUS,
For Greenhouses, Conservatories, &c.

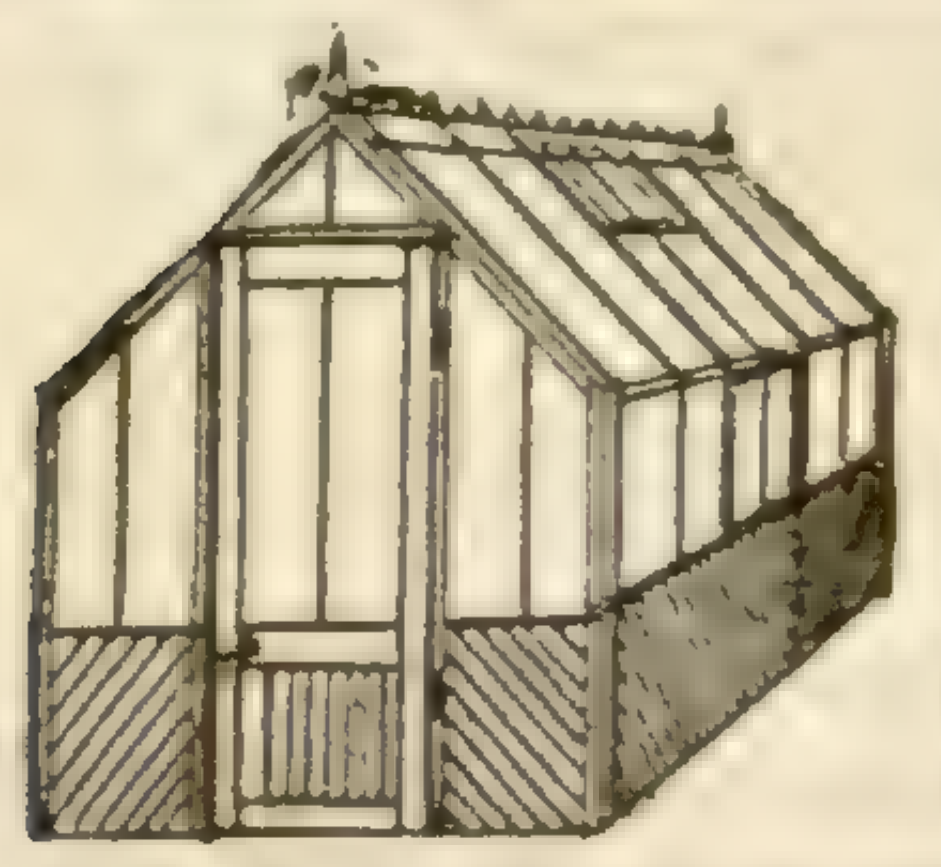
Most Economical and Efficient. This apparatus has attained great popularity. Made at our own foundry, and under our own supervision. Before ordering elsewhere, send for Price List, giving full particulars, free by post.

J. and W. WOOD,
Birmingham Street Foundry
STOURBRIDGE.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

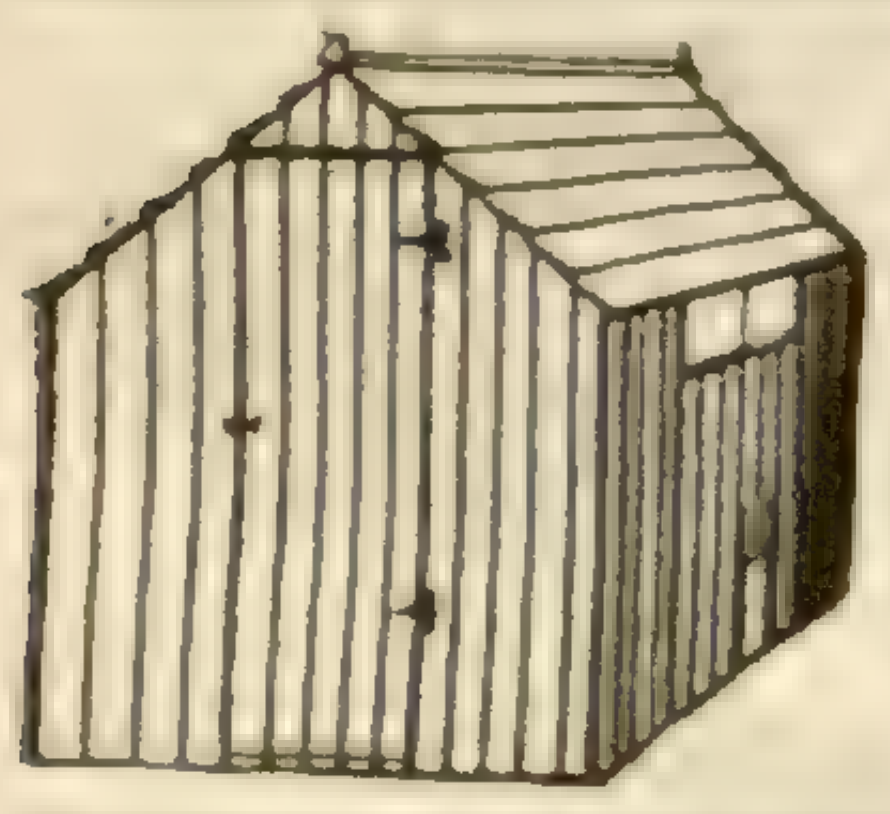


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3 12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more.

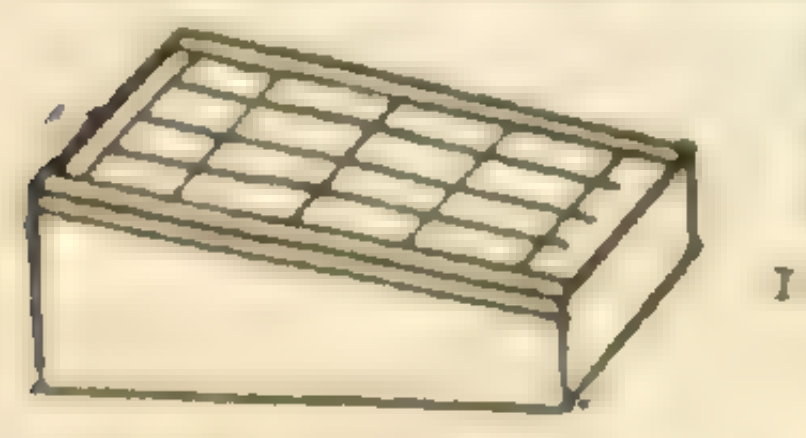
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.



4 X 3	8/9
6 X 4	14/6
8 X 6	22 6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

STANLEY-MOBBS and ASHTON (late Messrs. W. L. Lewis and Co.), fine plants of CATTLEYA SCHILLERIANA and C. Schofieldiana, imported and fine pieces and varieties of Catt. Harrisoniæ, Catt. Harrisoniæ Violacea, Catt. Velutina, Catt. Gigas in flower. Also Lælia Harpophylla, Oncid. Varicosum, &c., in spike.

On view morning of Sale and Catalogues had.

Sidcup, Kent, S.E.

SEVENTEENTH GREAT ANNUAL TRADE SALE of WINTER-BLOOMING HEATHS, particularly well-grown, and beautifully set with flowers. Also CLIMBING ROSES, including some good pieces of Turner's Crimson Rambler, forming together one of the largest and best collections of plants ever offered by auction.

MESSRS. PROTHEROE and MORRIS will SELL BY AUCTION, on the PREMISES, THE LONGLANDS NURSERY, S.E., about 10 minutes' walk from the New Eltham (late Pope Street) Station, S.E.R., on WEDNESDAY, SEPTEMBER 7th, at Eleven o'clock, by order of Messrs. GREGORY and EVANS, an enormous quantity of unusually well-grown plants, comprising:—

[illegible],000 Winter-flowering Heaths.
10,000 Roses.
8,000 Solanums, well-berried.
4,000 Genistas.
6,000 Bouvardias.
1,000 Ficus.
3,000 Aspleniums, in 32's and 48's.
3,000 Pteris major, in 32's and 48's
5,000 Pteris Wimsettii and cristata.
2,000 Adiantum cuneatum, in 32's and 48's.
2,000 Adiantum decorum, in 48's.
1,000 Crotons.
1,000 Polypodium aurea, in 48's.
3,000 Kentias, in 60's.
1,000 Selaginellas, in 48's.
1,000 Double Primulas, in 48's.

Also an Immense Stock of Small Ferns and other Plants.

May also be viewed. Catalogues had on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C.

N.B.—The Stock of Plants this season will be found up to their usual standard, and special attention is invited to the enormous stock of about [illegible],000 HEATHS and ROSES, which will be found particularly well grown, and will well repay an inspection by intending purchasers, as no better plants were ever offered at these Nurseries.

The Second Sale will take place on the Premises as usual on the FRIDAY in the Great Annual Trade Sale Week, viz., September 16th.

Wednesday Next.—Dutch Bulbs.

MR. J. C. STEVENS will SELL BY AUCTION at his GREAT ROOMS, 38, KING STREET, COVENT GARDEN, as above, at Half-past Twelve precisely, a splendid importation of choice named HYACINTHS, Tulips, Crocuses, Narcissus, and other bulbs from leading growers in Holland, and specially lotted to suit all buyers. French Forcing Bulbs, &c.

On view morning of sale and catalogues had.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

CACTUS DAHLIAS.

AT no period in the history of horticulture in this country have the raisers of new plants, fruits, and vegetables shown so great a degree of activity as during the second half of the century now drawing to a close, and we should search in vain for any similar period in which the advances have been more marked, or in which the results of hybridization and cross fertilization have been so far-reaching in their importance. We might give a considerable number of instances in proof of this assertion, but the tuberous begonias, culinary and sweet peas, and strawberries, with several other occupants of our plant and fruit houses, and gardens will at once suggest themselves to our readers. They will also readily call to mind the cactus dahlias, with their elegantly formed and richly coloured blooms, which contribute so much to the attractions of the garden and exhibition tent from the month of July until they fall victims to the icy breath of the frosts, which act as the heralds of the approach of autumn. Not a few of our readers who may institute comparisons between the more important achievements of the art of the hybridizer and cross fertilizer, will perhaps be inclined to regard the creation of the cactus dahlias as one of the greatest triumphs of the half century. If we do not feel justified in giving the cactus dahlias so high a position as some of our friends consider they should have, we highly appreciate their beauty and value, and we are filled with admiration of the manipulative skill, sound judgment, and exemplary patience of those to whom belong the honour of having obtained such splendid results. We need not discuss the utility of this important section of dahlias for the embellishment of the flower garden or for the supply of blooms for decorative purposes, for this is generally recognized. But it appears desirable to urge raisers to make the most strenuous efforts to lengthen the flower stalks, with a view to increase their effectiveness in the garden; to advise cultivators to use less manure in the preparation of the beds and borders for their reception; and to suggest to committees of societies holding their exhibitions during the dahlia season the advisability of giving greater encouragement to the artistic display of the blooms. In the matter of staging cactus varieties at exhibitions the dahlia growers have set an example which the exhibitors of Japanese chrysanthemums might in some cases follow with advantage. They recognised at a very early period in the history of the section that dumping the blooms down on a flat board was not the best way of presenting them to public notice, and quickly devised a means of exhibiting them in elegant, if somewhat formal bouquets. Arranged in bouquets of six blooms each they produce a rich effect, as was so admirably exemplified at Brighton during the past week. Admirable as is the effect now produced by stands of blooms arranged in accordance with the practice that now generally obtains, we are strongly of the opinion that the time has come for encouraging arrangements suitable for indoor apartments. A commencement might be made by providing a few classes for vases containing from nine to twelve blooms, as may be considered the most advisable, in association with suitable foliage. Vases of blooms, either in mixture or in separate colours, present a charming appearance, and as a good competition may be ensured by offering moderate prizes a new and useful feature may be added to exhibitions without a heavy outlay.

FRUITS.

AMONG the innumerable artifices evolved in the struggle for existence, for the purpose of enabling plants to become disseminated far and away from the parental sources, succulent edible fruits of all classes must certainly be ranked as the cunningest of all. The thistle-down floating in the breeze o'er hill and dale represents one mode of dissemination, the explosive seed-vessels of the balsam sending their contents yards away, is another and less efficacious one, the burr hooking itself on to the coats of man or beast, and so borne, involuntarily, far afield, before being detached, is another type, but none of these is so complexly clever as the seed which, clothing itself with delicate lines, cries, as it were, "Come, eat me," and being eaten, parts with its luscious coating only, and uses its devourer as transmission agents by defying digestion. The grape, the currant, strawberry, gooseberry, raspberry, blackberry, indeed, most of the berry tribe, if not all, have adopted this dodge, and man, with his usual selfishness, induces all these to pile up their savoury stores for his benefit, and then cooly nets all the profits by netting or otherwise protecting his plants, so that the birds are denied their toll, and the chief aim of the plants is defeated. The stone fruits, plums, cherries, peaches, apricots, &c., are hardly so clever; their lures incite to robbery also, but though the precious seed be carried away with the tempting fruit, its journey is more limited, and the bulk rarely travel beyond the foot of the tree, which they would reach without any lure at all in the ordinary course. The pip fruits, such as oranges and lemons, apples and pears, also seem to give a great deal of small service, since under natural conditions they are hardly likely to travel far when plucked by predatory beasts or birds, unless it be in climes where the monkey comes in in lieu of the schoolboy, and uses the fruit as missiles as well as food. It is, however, possible that many large fruits may be helped in the struggle for existence by the manurial stimulas the external portion may impart to the seeds which germinate where the fruit has lain and decayed, the seeds thus deriving nourishment from the parental plant indirectly to supplement the albuminous store always provided in the seed itself. The recorded cases of melon and other seeds sprouting and growing within the fruit strengthen this possibility, especially since it is only reasonable to assume that the fruit would contain precisely those elements which would aid the development of the seed it envelopes. If this view be accepted, then we have another ingenious contrivance to further reproduction, the end and aim of all fruitage. With our cultivated fruits, however, their present forms are so much to man's tastes and selective care that the original use of the fruit is altogether subordinated to his requirements, and the reproductive energies of the plants concerned are so ignored in the process of selection as often to be quite eliminated. The seeds are not wanted, only the attendant lusciousness, and given time enough, selection on these lines yields the fruit, minus the seed, or bearing merely the rudiments, while propagation becomes only practicable by means of buds and cuttings. Even here, however, the finest fruit is the most widely disseminated, so after all the cleverness of the plants comes in, enlisting as it does the service of man himself by its attractions, and securing its continued existence, seed or no seed.

HABITATS.

IF we travel about the earth's surface and keep our eyes open as regards the vegetation which clothes the major part of it in innumerable forms, from the incipient ones of arctic lichen and moss to the dense jungle or forest of the tropics, we cannot fail to notice that some species of plants are extremely local in their occurrence, cropping up quite suddenly in profusion, and as suddenly ceasing to be seen very shortly afterwards as we proceed. If we examine these plants we shall find that this limited area is not due to any particular lack of disseminating power as regards their seed, and the limitation must therefore be due to some other cause. On further investigation we may find them to be water or bog loving plants, and their flourishing character is seen to be due to a local spring and a retentive soil, which affords at this precise spot, and there only, the particular conditions indispensable to growth, in the large majority of cases. However, the reason is by no means clear, and we are driven to impute the restriction to local soil constituents which favour a development of this particular species, and may be check that of others. The diversity of soils is indeed immense, especially in rocky regions, where different formations crop up, and by their weathering down create each a different sort of *débris*, which mixed with the decaying and special vegetation which it has particularly favoured, becomes eventually a very peculiar kind of compost indeed, both the original elements of the rock and the subsequent humus or leaf mould differing from those in the vicinity. In travelling through the south of England we may see two extremes of this class; in Kent the softly swelling outlines of the chalk hills are flanked by whitish grey fields, liberally strewed with flints, a short stunted and very peculiar lime loving flora clothing the soil wherever it is uncultivated. Steering west, however, and reaching Devon, we come upon the red sandstone, with hills also of rounded couture, but covered with rich red, brown, and chocolate-coloured fields, as bright in tint as a painter's palette could make them, and with a rich vegetation of intense verdure and vigour, forming a fitting foil in the landscape with its complementary tints. These are but two leaves of the great book of Nature beneath our feet, each page of which is a stratum of rock which once represented a surface, and no two of which are identical in their composition or history. In some parts where these lie parallel with the present surface we have an evenly distributed vegetation due to similarity of conditions; but in others, where slow crumpling or the volcanic catastrophes of the past have turned the leaves edgewise, there naturally we may expect to find, and do find, that the varied habitats mean varied tenants, and while the number of species is immensely increased, their limits are inevitably more or less sharply defined. Other conditions of environment, of course, come in as factors, but these more or less invisible soil complications are certainly the main ones in determining the local prevalence of plants, and their restriction to certain spots. The mere mechanical texture of a soil must often determine the start in life, or extinction of it, in a seed. It is in these delicate, incipient stages that small favourable or unfavourable points become of vital importance; the rapid or slow germination of the seeds themselves is another factor which would interact with the rapid or slow drying of a soil, and tend in many cases to determine that only a particular class of soil would permit the seed to grow, which means a rigid limitation to the area occupied by the parental form as its habitat.

Hunnemannia fumariæfolia is an extremely pretty half-hardy perennial introduced from Mexico by a Mr. Barclay, of Bury Hill, in 1827. Both in foliage and flowers it is very much like Eschscholtzia californica, the full poppy-shaped bloom being brilliant golden yellow, tinted with orange. This plant may be cultivated as a biennial, and if kept in a cool greenhouse or pit during the first winter it will flower freely during the following summer, especially if the season is a bright and warm one. The genus Hunnemannia is monotypic, and the title was given by Sweet, in compliment to Mr. John Hunneman, who was a well-known botanical agent and introducer of new and rare seeds and plants early in the present century. Although generally treated as a biennial on account of its tenderness, Hunnemannia fumariæfolia is a true perennial, and consequently should not have been included by Messrs. J. Veitch and Sons in their display for the Sherwood Cup on Tuesday last.

Fruit Sales.—Numerous sales of growing crops of fruit have been held in Kent during the past fortnight, and the prices realised have on the whole been satisfactory to growers. On Friday, the 19th, a sale was held at Paddock Wood by Mr. Tompsett of the crops of about five hundred acres, consisting of apples, pears, plums, and damsons, and the prices obtained for the more important crops were as follows: Hale Street Farm, apples only, 5a. 2r., £45. Tanners and Church Farms, apples only, 4a. 2r., £40. The Grange Farm, apples, plums, and damsons, 6a., £200; damsons, pears, and apples, 2a., £10; apples, 25a., £210. Badsell Farm, apples, 10a. 3r., £155. Hadlow Place—Damson plantation, 1a. 2r., £34; young plantation, apples and plums, 3a. 2r., £60; apples, pears, and plums, 3a. 0r. 28p., £54; Gold-hill Farm, apples, pears, and walnuts, 3a. 2r., £37. Cronk's Farm, apples, 4a. 2r., £105. Bainden, damsons and apples, 18a.; apples, plums, and damsons, 19a.; and apples, 2a. 2r., £455. Brenchley, apples and damsons, 8a., £125. Matfield, 2a. 1r. 15p., £22.

Chelsea Botanic Garden.—The Charity Commissioners have agreed to take over the trust of the Physic Garden, Chelsea, and maintain it for the purposes of botanical study. It is situated at the east end of Cheyne Walk, covers more than three acres, and was originally leased from Lord Cheyne by the Apothecaries' Company in 1673 for a barge and boat house. In 1721 Sir Hans Sloane, who had purchased Chelsea manor from the second and last Lord Cheyne, presented it to the Apothecaries' Company in trust upon the express condition that "it should at all times be continued as a physic garden for the manifestation of the power, and wisdom, and goodness of God in creation, and that the apprentices might learn to distinguish good and useful plants from hurtful ones." Sir Hans also stipulated that fifty specimens of plants reared therein should be sent annually to the Royal Society until two thousand were delivered. The presentations continued to be made at intervals until the year 1793. In 1853 the herbarium was given to the British Museum. The garden contains a fine old cedar—one of four presented by Sir Joseph Banks, who studied botany in this old garden. It is supposed that these four cedars were the first to be successfuly planted in London. One of the set was destroyed by storm, two others died from natural causes, and the remaining specimen will not last many more years. A large limb of one of the trees was made into four chairs for the use of the wardens at the Apothecaries' Hall.

Sugar-cane Cultivation in Spain.—The cultivation of the sugar cane is the main resource of the Motril region of Southern Spain, the fertility of the soil being in great measure due to the alluvial deposits brought down by the mountain torrents in their course to join the River Guadalfeo, which runs through the Vega. An abundant crop is looked forward to this coming season, and its value will fully compensate growers for the sacrifices and delay in growing. Prices are expected to rule remuneratively, as there are seven cane-crushing establishments in the neighbourhood, and there will be brisk competition in buying. The crop of cane from Motril, Lobreno, and Salobreño, is calculated at about 10,500,000 arrobas (an arroba equals 25 lb.) To this may be added some 80,000 arrobas from Castel de Ferro for crushing, and, besides, Almuñecar produces 1,200,000 arrobas for supply of the crushing mills established there.

British Association.—The arrangements for the meeting of the British Association at Bristol are now approaching completion. The real work of the association is done at the various sectional meetings, and some of those which will be held at Bristol appear to be of a particularly interesting character. The President of the Botanical Section is Professor F. O. Bower, F.R.S., whose address will probably be devoted to discussing our present views as to the classification of the members of plants. There will also be a discussion, which is expected to be of a very interesting character, on alternation of generations, which will be opened by Dr. W. H. Lowe. One of the afternoons will be given up to a popular lecture on a physiological subject by Mr. Blackman. The President of the Geological Section is Mr. W. H. Hudleston, F.R.S., and in his presidential address he is expected to deal mainly with certain points in the geology of the south-west of England east of Dartmoor. It will be an address devoted principally to the local geology. Keeping Bath as the centre, Mr. Hudleston will probably draw attention to the great variety of geological formation within a radius of fifty miles—a variety which is hardly matched anywhere in the country in an equal area.

Australian Oranges.—Large consignments of oranges have been dispatched to London of late from Australia and the experiment of exporting oranges to this country is being watched with much interest by the growers in New South Wales and Victoria. It is anticipated that should this year's shipments prove successful a considerable trade will be done in these fruits between the two colonies and England. Mr. W. N. White says that last May, when he believed that the coming fruit crops in this country were likely to prove a failure he cabled his firm's agent at Hobart, Tasmania, to at once proceed to Sydney and see if he could get in touch with the Government in connexion with the shipment of oranges to this country. The upshot of this was that their agent induced one prominent dealer to guarantee a certain quantity if he would advance so much money against them, and after that he approached three or four of the local fruit associations, who at once circularised the whole of their members, stating that an advance could be made which would be more than sufficient to pay for the fruit, packing, and cases, and that the freight would be paid to England if they would guarantee a certain amount on consignment. That guarantee the agent obtained. These goods have all been shipped in the cool chamber, as experiments have previously proved that it is useless to attempt to send them as ordinary cargo. In the cool chamber the risk of their arriving in bad condition is infinitesimal, but shippers have to contract to pay for the space whether filled or not, and a sufficient quantity must be contracted for to induce the steamship owners to put their refrigerating machinery in order. Messrs. W. N. White and Co. expect this season to receive between 20,000 and 50,000 boxes from New South Wales by way of a beginning, and if the season's trading proves successful they think that future shipments from the Australasian colonies to this country will total 100,000 boxes yearly. The first consignment of these oranges arrived in London on Monday last by S.S. "Ormuz"; there were 8,000 cases containing an aggregate of about a million and a half oranges. Unfortunately, during the voyage, the refrigerating machinery broke down, with the result that at least two thirds of the cargo were found to be spoilt. This is a great loss and disappointment, but better shipments are expected later, as, so far, only about a quarter of the anticipated supply has arrived.

Cheap Transit of Garden Produce.—It is highly satisfactory to know that remarkable success continues to attend the enterprise of the Great Eastern Railway Company, which carries farm and garden produce, such as cheese, butter, cream, eggs, fruit, fowls, and flowers at special cheap rates from the country districts to London and the large towns on its system and provides boxes in which to pack the produce, at merely nominal rates. The scheme under which garden produce and the minor products of the farm are conveyed over the company's system direct to the consumer from the producer was put into operation about ten years since, and last year the number of packages was 112,000, and in the first six months of this year a total of 71,300 packages was reached. The value of these boxes is averaged at 7s. 6d. each, so that the G.E.R. scheme means £50,000 per annum flowing into the East Anglian district for produce for which there was practically no outlet at remunerative rates.

Women and Rural Industries.—An experiment not without some interest is about to be made by the Countess of Warwick, with the object of training women in gardening and farming. According to Miss [illegible], Lady Warwick's original idea was to form settlements in different parts of the country where women—principally the daughters of professional men—could [illegible] their very small incomes, or make their living by the products of their own large cottage gardens. Builders were to be persuaded to put up sets of small cottages each suitable for two women, who would cultivate or utilise the plot of land attached to each. About six or eight of the cottages were to form a settlement. Then there was to be a market centre for each settlement, and some authorised person who would manage the sale of the products for these individual workers. But it was "discovered" that before women could be expected to make gardening, farming, or poultry keeping pay they must thoroughly understand the subject. When or how the discovery was made we are not told, but we were under the impression that it had long been known to all who had an elementary knowledge of rural industries that it was no more possible to achieve success in the production of fruit, vegetables, butter, and eggs without an intimate acquaintance with the details, than to successfully engage in an ordinary trade without having had some previous training. Recognizing the necessity of proper training Lady Warwick made arrangements with the authorities of the University Extension College at Reading to provide the necessary course of instruction, and thus prepare the women for the settlements later on. The hostel, which Lady Warwick hopes to open in October in connection with Reading College, will be an institution where the necessary training may be obtained. It will be founded for the definite purpose of enabling women over the age of sixteen to obtain a thorough training (theoretical and practical) in the lighter branches of agriculture, viz.: Flower and fruit growing, and packing for market, especially bush fruits, tomatos, mushrooms, &c., bee and poultry keeping, and dairy work. The council of Reading College have consented to provide the necessary courses of instruction, and to recognize the Countess of Warwick's Hostel as a place of residence for women students. The grounds of the hostel will afford room for practical work. The full course of instruction will extend over two years, but students who wish to do so may join the short courses and special classes. It is hoped by Lady Warwick that the inclusive fees for instruction and board will not exceed £50 a year. This, it is believed, will bring the training within the means of the particular class of women whom it is proposed to assist by the scheme—the one which has, perhaps, the greatest difficulty in finding a remunerative occupation—namely, the daughters of professional men, left with, or likely to be the possessors of, incomes varying from £30 to £100 a year. The sum of £2,000 will be required for capital, and towards this amount some has already been promised. The instruction it is proposed to give under the scheme should be useful to a large number of women, such as the daughters of farmers and small landowners, who have a taste for rural pursuits, and anticipate marrying farmers and others engaged in the management of land. We shall watch the development of the scheme with much interest, and trust that under it the object in view may be accomplished.

Cannas at Chiswick have never succeeded so well as during the present season; the collection is extensive, occupying both divisions of the Paxton House, and affords a splendid opportunity for any one interested in these handsome plants to make comparisons and selections. There is a wide difference in the height and habit of the varieties, the shape and colour of the leafage, freedom of flowering, length of spike and colour and size of the blooms. On the occasion of a recent visit to the gardens by the R.H.S. Floral Committee four varieties were selected as worthy of the Award of Merit, these being named Stradrath Heidenreict, Partenope, Comtesse de Vartoux Florence, and William Marshall. The latter does not appear to be so distinct from previously named varieties as we could wish, especially considering the name it bears; it is presumably one of a batch of seedlings raised by Mr. S. T. Wright at the gardens. The committee also made awards to two Indian pinks, forms of Dianthus chinensis, and to Bronze Queen viola.

American Apple Exports.—From August 7, 1897, to June 11, 1898, the United States and Canada exported 913,996 barrels of apples. This is only a third of the business of the previous season, when 2,919,846 barrels were exported, but constitutes a fair average for recent years. Of the sum first named, Liverpool received the greatest proportion, 490,000 barrels; followed by London, 198,000; Glasgow, 124,000; Hamburgh, 89,000 barrels. Of the ports of export, New York led with 362,000 barrels, against 570,000 the previous season; Boston [illegible] only 176,000, compared with over 1,000,000 in 1896-7.

Olive Tree Disease.—For some years past the olive trees in Italy have been affected by a yearly recurring disease, so that the olive harvest has been excessively meagre, and supplies have had to be imported from Tunis, Spain, and Southern France for Italian consumption. The disease first appeared in Italy in 1889; since 1891 it has also affected the olives of the South of France; those in Spain and Tunis are said to be still untouched. The small round spot on the fruit which indicates the presence of the disease is called by the peasantry "the peacock's eye." A minute fungus *(Cycloconium oleagium)* is the cause of the disease, and may be kept in subjection by the proper use of a suitable fungicide.

A Distinct Hybrid Pea has been obtained by Mr. Henry Eckford at his nurseries, near Salop, being the result of a natural cross between a culinary pea and a sweet pea. The newcomer is thus a bi-gener, for the culinary pea has been selected from Pisum sativum, and the sweet pea from Lathyrus odoratus. In growth the new plant is robust, but does not possess the stout stems and leafage of Mr. Eckford's new culinary peas; it is much branched, has white flowers, and [illegible] small, full pods of round peas that are pale, buff-coloured, and of a waxy appearance. The peas are very sweet to the taste when raw, but we have not tried them cooked. The crop is a very heavy one. Whether this new pea will ever be of any commercial value is at present an open question, but the plant is very interesting, both horticulturally and botanically. The wonder is that the hybrid has been so slow in coming, especially when we consider the very many scores of both culinary and sweet peas that Mr. Eckford grows side by side at Wem, in Shropshire.

Stoneless Cherries are produced in France, says a contemporary, by the following method: In the spring, before the circulation of the sap, a young seedling cherry tree is split from the upper extremity down to the fork of its roots; then, by mean of a piece of wood in the form of a spatula, the pith is carefully removed from the tree in such a manner as to avoid any excoriation, or other injury; a knife is used only for commencing the split. Afterwards the two sections are brought together and tied with wool, care being taken to close hermetically with clay the whole length of the cleft. The sap soon reunites the separated portions of the tree, and two years afterwards cherries are produced of the usual appearance, but instead of stones there will only be small soft pellicles.

The Plymouth Strawberry.—A specimen of this strawberry was received through Dr. Masters by R.H.S. Scientific Commitee, from Mr. J. Arrowsmith, of Bank Road, Glazebrook, Manchester. It is a monstrous condition of the ordinary fruit, in which some of the achenes are replaced by leaves, as in the well-koown Alpine strawberry, of which the present case is a variety. It was described by Ray, who gave the name, having received it from Plymouth. It resembles the Green Rose, in thus having its floral organs more or less in a state of reversion to leaves.

Sevenoaks Flower Show was, we are pleased to learn, highly successful from a financial point of view. The attendance was far larger than at any previous gatherings, and the takings at the gate amounted to £113 12s. 6d. After five o'clock, when the charge for admission was lowered to sixpence, an additional entrance to the show ground was opened, and at this the sum of £27 15s. was taken in sixpences.

Californian Fruits.—The recent report of the California State Board of Agriculture shows that this favoured state produced orchard fruits in 1897 to the value of £4,257,909. This total was divided as follows: Citrus fruits, £770,000; prunes, £580,000; dried fruits other than prunes, £520,000; raisins, £457,000; deciduous fruits, £400,000; nuts, £120,000; canned fruits, £1,410,909.

A Pleasant Holiday.—The members of the Lee and Blackheath Horticultural Society had a holiday on the 18th inst., and visited Messrs. Sutton and Sons establishment. They were much interested in what they saw in the offices, ware houses, and trial grounds, and returned home highly gratified with the instructive and pleasant holiday they had enjoyed.

Small Fruit and Poultry Farms.—Whatever may have been the advantages of large holdings in the past, there can be no doubt that under the conditions at present obtaining *petite culture* is steadily increasing in importance. Accepting this view of the case, the potentialities of a sixty-acre farm present themselves, in the opinion of the *Land Magazine*, in a far more auspicious light than was possible some years ago. With a holding of those dimensions, a tenant will require £600 to start with, for £10 per acre is none too much to spend if he is desirous of making a sure foundation, and of being in a position to avail himself of falling markets by buying food stuffs and stock at a great advantage. Twenty-five acres should be set aside for pasture, and thirty-five for arable land. The object, of course, is to keep the largest amount of stock without overcrowding. To make this farm pay, however, after giving sufficient attention to ordinary farm stock, the greatly neglected minor sections of agriculture—poultry, rabbits, and fruit growing—must be adequately represented. In this department the tenant, and if he is married, his family, will find ample scope for a remunerative occupation. Rabbit-keeping is, in the opinion of our contemporary, of great commercial value, and it is stated that with some fifty breeding does the owner should have annually one thousand five hundred young rabbits at his disposal. These at fourteen weeks or so will realise 1s. 6d., of which 6d. at least should be net profit. This represents £37, or more than half the rent of the holding. Of course, every attention must be paid to the animals. Regular and wholesome food, plenty of room, scrupulous cleanliness, and a genial temperature are essential for success. But of all the sections of small holdings, commercial poultry-keeping occupies the foremost rank. Having in view the need of economising time and labour, the production of eggs is to be preferred to that of table fowls. It is, however, to egg production on a considerable scale that the farm of sixty acres specially lends itself, and with the double advantage of combining with this industry the important addition of fruit-growing. For this purpose five acres of land should be set apart, sheltered as far as possible from north and east winds. The whole of the five acres will be enclosed with six-feet wire netting, and sub-divided into half-acres running parallel. This will give ten runs, the whole being planted with selected half-standard apple trees, of cooking varieties for preference. Planted at twenty feet apart each way, one hundred and eight trees will be required per acre, or allowing for the fowl houses, one hundred. Good six-year-old trees can be purchased of any reliable grower at 2s. each, making a total of £50. Each run will carry a flock of fifty hens, for which suitable houses must be erected, having a southern aspect. The flock of hens should, it is assumed, give, after deducting £117 for food—a liberal allowance—eggs to the value of £123 7s. per annum. For the first few years this important sum would be subject to a reduction, representing the cost of the houses and enclosing and the cost of the trees. The annual value for five years of the fruit from the five hundred apple trees, at the low average of 1s. 3d. a tree, would amount to £31 10s. per annum, or a total of £157 10s. to provide for the cost of trees, houses, and material for enclosure of runs. At the expiration of the five years the value of the fruit, which would by that time have greatly improved, must be added to the yearly profit on the eggs. The figures will serve to show the extreme value of this system of combined fruit and poultry farming to prove the satisfactory results which a careful adoption of such minor industries as rabbits, poultry, and fruit is capable of producing.

The Hampton Court Vine carries about twelve hundred bunches of grapes this year, and these are now almost ripe. This famous vine is now a hundred and thirty years old.

ROYAL HORTICULTURAL SOCIETY.

COMPARED with its predecessors, the show of August 23 at the Drill Hall was a small one, and it was quite a treat to see flowers and plants arranged without that excessive crowding that so often obtains. It was an interesting display, the early fruit being very good.

FLORAL COMMITTEE.

Gladiolus and hardy herbaceous subjects were plentiful, but dahlias were not so plentiful as was expected. Bouvardias were first-rate, so were the annuals, especially salpiglossis and scabious.

Gladiolus were well shown by Messrs. R. Wallace and Co., Colchester, who arranged handsome bunches of the leading Lemoinei varieties, together with a few gandavensis forms. Liliums were represented by large spikes of L. auratum, L. a. platyphyllum, L. Henryi, L. Batemanniæ, and L. speciosum. The same firm made a splendid show of montbretias and tritonias, making a fine exhibit of the former in a dozen or so varieties, of which the best were Rayon d'Or; Aurea, tall and bright; Eldorado, dwarf, yellow; Feu d'Artifice, deep scarlet; Pottsi grandiflora, scarlet and yellow; Solfaterre, new, bright yellow; Gerbe d'Or, Elegans, and Chrysis, a fine bold form with golden flowers. A silver-gilt Banksian medal was awarded. A magnificent display of gladioli came from Messrs. Kelway and Son, Langport, who staged a hundred and sixty-eight large spikes of substantial and richly-coloured blooms; a goodly number were unnamed seedlings, and among these we noted a splendid intense crimson form, and another with yellow flowers marked with red in the throat. Some especially handsome named varieties were Frank Myles, salmon; Clough, salmon and rose; Shahzada, crimson; Lady Wimborne, blush and rose; Charterhouse, pink, splashed with red; Colossal, crimson scarlet; Duchess of York, blush; W. G. Grace, rose, cream and crimsom; and R. Palairet, soft salmon-scarlet. Silver-gilt Banksian medal.

Messrs. Barr and Son, Covent Garden, had an extensive display of hardy flowers occupying one side of a long table with large bunches of bright subjects, such as Lilium tigrinum, Cæonothus azureas, phloxes, gladiolus, gaillardias, Hemerocallis Kwanso, fl. pl., Scabiosa lutea, echinops, delphiniums, Anemone japonica, &c.; silver flora medal. Scabiosas and salpiglossis were grandly shown by Messrs. H. Cannell and Sons, Swanley; the former were shown in large bunches of a variety, and seeing these gorgeous displays one wonders why the salpiglossis are so seldom grown in gardens. Atrosanguinea, rosea, azurea, albolutea, lutea, and coccinea are varietal descriptive names given to well-selected varieties by the Swanley firm. The white, red, crimson-purple, lavender, and rose-coloured double scabious were as beautiful as the salpiglossis. The Messrs. H. Cannell and Sons also showed some splendid cockscombs in a variety of colours; silver Banksian medal. Messrs. J. Veitch and Sons, Chelsea, staged an exhibit of annuals in competition for the Sherwood cup, and again were the only exhibitors; salpiglossis, sweet sultans, scabious, phloxes, asters, nasturtiums, dianthus, godetias, sunflowers, schizanthus, annual chrysanthemums, senecio, lavatera, and Brachycome iberidifolia were among the most attractive kinds on view, the whole making a pretty display.

Mr. W. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, made quite a fine display of gladioli, largely Nancianus and Lemoinei hybrids; the Lemoinei form named Peterhof is very attractive, having rounded flowers coloured crimson and blue; Paul Lemoine, yellow and red, was also good; while the deep rosy-crimson Gambetta was distinct from either. Large white spathes of anthuriums and the pink Dr. Lawrence were also shown, and proved most attractive, while the peculiar crested begonias also came in for a large share of attention; silver Flora medal. Mr. Purnell Purnell, Woodlands, Streatham Hill, an enthusiastic amateur, put up a large group of plants, the liliums, plumbagos, begonias, fuchsias, &c., combining well with various ferns, palms, caladiums, asparagus, &c.; silver Banksian medal. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, put up a brilliant display of dahlias, liliums, &c.; the pompon and cactus dahlias were good, but much too crowded to be effective. A few of the choicest pompons were Ariel, Thomas Moore, Fashion, Eurydice, Salmon Queen, Hector, Admiration, Fairy Tales, Captain Boyton, Whisper, and Crimson King. A background was formed of tritomas, liliums, bamboos, veronicas, &c.; silver Banksian medal.

A display of handsome and finely-grown bouvardias from Mr. H. B. May, Edmonton, occupied a large space, and under the plants was a bed of various maidenhair ferns; the bouvardias shown were the large-flowered Humboldti grandiflora, H. corymbifera, President Cleveland, Vulcan, Jasminoides, Reine des Roses, President Garfield, Priory Beauty, Alfred Neuner, Maiden's Blush, Albo odorata jasminiflora, Dazzler, and Hogarth, fl. pl.; this was by far the best lot of bouvardias we have seen at the Drill Hall; silver Flora medal. Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, sent flowers of some lovely hardy water lilies—N. odorata exquisita, bright rose; N. o. rosacea, N. o. sulphurea grandiflora, and N. Marliacea chromatella, a grand variety with very broad segments. Mr. J. Evans, Darley Dale, Bath, showed Winnie Webb carnation, a curious heliotrope shade. Mr. Barnett, gardener to Miss Aldersey, Chester, showed a seedling cactus dahlia, and new cactus forms also came from Mr. G. Gusney, Southall. Mr. J. Green, Norfolk Nurseries, Dereham, sent a fine form of Lathyrus grandiflora alba, and some single hollyhocks.

ORCHID COMMITTEE.

Very few exhibits came before this body, but among the plants exhibited there were a few of special interest.

Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, staged a charming specimen of Platyclinis filiformis, carrying over one hundred of its pendant golden spikes; he also showed a flowering specimen of Saccolabium Hendersoni. Messrs. J. Veitch and Sons, Chelsea, staged Epidendrum radicante—Stamfordianum, a hybrid between the species that form its name; Masdevallia Circe, Disa Clio, a pretty hybrid between D. Veitchi and D. grandiflora; also Cyprepedium Rothschildiano-villosum. Mr. T. Hogg, Woodside Gardens, Paisley, N.B., showed Cypripedium Lawrebellum, another addition to the bellatulum hybrids.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed a few good orchids, notably a good plant of Cypripedium bellatulum album, C. Charlesworthi, C. Curtisi, C. Lawrenceanum Hyeanum, Phalænopsis amabilis, Sobralia xantholeuca, Cattleya bicolor Wrigleyana, Lælio-cattleya Aurora, Oncidium Lanceanum and some fine forms of Lælio-cattleya elegans, notably L-c. e. Enfieldiensis, a brilliantly coloured form. Messrs. F. Sander and Co., St. Albans, showed Odontoglossum Bictonense album, Cattleya Leopoldi, Oncidium ornithorhynchum album, Cattleya velutina, C. Gaskelliana, the curious and wonderful Bulbophyllum grandiflorum, and the quaint and sensitive B. barbigerum, that afforded amusement to the visitors by reason of the queer jerking movement of the flowers; the Messrs. Sander staged their orchids amid Acalypha Sanderi and Dracæna Godseffiana.

Mr. W. Cobb, Tunbridge Wells, showed Cattleya intermedia crossed with [illegible], a pretty hybrid with white sepals and petals, and rosy lips. Mr. Norman Cookson, Wylam-on-Tyne, sent a magnificent variety of Cattleya Hardyana named Oakwood var., and Mr. G. F. Moore, Bourton-on-the-Water, sent a flowering plant of the yellow ground form of Cypripedium Godefroyæ leucochilum. Mr. F. Moore, Glasnevin Botanic Gardens, staged Acineta colossa, with fleshy, cream-coloured flowers, and Sir H. Fairfax, Ravenswood, Melrose, N.B., sent a fine spike of Odontoglossum Harryanum, a deep-coloured form with large blooms.

FRUIT COMMITTEE.

Some beautiful fruit was shown by Messrs. T. Rivers and Son, Sawbridgeworth; the eight specimens of Peasgood's Nonsuch apple were magnificent in size and colour; Dryden nectarines, Early Silver peaches, McLaughlin's gage, Late Transparent and Oullin's Golden Gage plums were all splendid; silver Banksian medal. Mr. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, exhibited fine dishes of Brown Turkey figs, Grosse Mignonne and Alexandra and Alexander Noblesse peaches. Messrs. J. Veitch and Sons, Chelsea, brought a large fruiting specimen of Rubus phœnicolasius, the Japanese wine berry. This was about nine feet high, and carried large numbers of sprays of bright crimson fruits.

From Maidstone Messrs. G. Bunyard and Co. brought an extensive exhibit of apples, pears, plums, peaches, &c.; among the numerous fruits staged we noted dishes of the American Burbank plum, Dr. Hogg peaches, Worcester Pearmain, White Transparent, Yorkshire Beauty, Mr. Gladstone, Okera, Beauty of Bath, Lady Sudeley, Red Quarenden, and Williams' Favourite apples, and Williams' Bon Chretien and Beurre d'Amanlis pears; silver-gilt Knightian medal. Messrs. Cannell and Sons, Swanley, sent examples of the perpetual strawberry, St. Joseph. Mr. J. Hudson sent Alpine strawberries from Gunnersbury House Gardens; these were Quatre Saissons, Rouge Ameliore, Belle de Meaux, and Improved Red, the fruits being taken from plants raised as seedlings in April, 1897; Mr. Hudson also sent Royal Sovereign strawberries gathered from plants that had previously borne a crop when forced. Mr. Kelf, gardener to Mrs. Abbott, Regent's Park, sent some good Sea Eagle peaches. Laxton's Perpetual strawberry, shown by the Laxton Brothers, Bedford, is remarkable in producing a truss of fruit from each runner; the same firm showed the new St. Joseph strawberry and fruiting sprays of the so-called strawberry-raspberry.

A choice collection of fruit was exhibited by Mr. Rickwood, gardener to the Dowager Lady Freake, Twickenham; this comprised Black Hamburgh grapes, Morello cherries, Beauty of Syon and Syon Perfection melons; St. John's figs, Princess of Wales, Prince of Wales, Teton de Venus, Dr. Hogg, Early Louise, Alexander Noblesse, Hale's Early, and Goshawk peaches; white and red currants, Jargonelle pears, Lord Napier nectarines, plums, and apples in variety; silver Banksian medal. Mr. A. T. M. Pipon, Farningham, showed tomatos; and from the R. H. S. Gardens, Mr. S. T. Wright sent the currant tomato in fine condition. Langley Pippin is a good new dessert apple, shown by Messrs. J. Veitch and Sons, Chelsea, and is a cross between Cox's Orange Pippin and Mr. Gladstone. Mr. C. Springham, Chepstow, sent a red seedling apple for name, and Messrs. Harrison and Sons, Leicester, sent fruiting growths of the strawberry-raspberry.

NEW PLANTS, FLOWERS, AND FRUIT.

NYMPHÆA ODORATA SULPHUREA GRANDIFLORA.

THIS is a charming hardy water lily, having large flowers of a bright creamy colour on the outer segments, but having deep yellow central petals and golden stamens. The flowers are of large size, and the segments are much more pointed than in N. Marliacea chromatella. The leaves are bright shining green, spotted underneath with purple. A.M., R.H.S., August 23. Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

HUNNEMANNIA FUMARIÆFOLIA.

An old but most interesting and beautiful perennial with large flowers that partake in appearance both of Eschscholtzia californica and an Iceland poppy. The blooms are rich golden-yellow with faint shadings of orange-yellow. The leafage is elegant, much divided, and of a slightly glaucous green shade. An extremely pretty plant, and lasts well in a cut state. A.M., R.H.S., August 23. Messrs. J. Veitch and Sons, Chelsea.

GLADIOLUS MADAME DESBORDES LAMORE.

A grand variety of the Lemoinei section, with broad and bright pink upper segments, the lower three being creamy-pink, and each with a large central scarlet blotch and crimson stripe. A.M., R.H.S., August 23. Messrs. Barr and Son, Covent Garden.

DISA CLIO.

This is a variable hybrid, or secondary hybrid, obtained by crossing Disa grandiflora with D. Veitchi; in some of the flowers the rosy-carmine hue is very bright, while in others the colour is almost scarlet, and yet again in others is of a soft rose colour. The flowers are of large size, and three or four flowers are borne upon a dwarf spike. The lip ranges from palest rose to rich scarlet. A.M., R.H.S., August 23. Messrs. J. Veitch and Sons, Chelsea.

LATHYRUS GRANDIFLORA ALBA.

This is a beautiful large-flowered and strong-growing form of the old perennial lathyrus; it has large spikes of big, pure white flowers that are most effective for any floral decoration and for garden use. The variety is extremely floriferous, and well worth cultivating everywhere. A.M., R.H.S., August 23. Mr. J. Green, Norfolk Nurseries, Dering.

LANGLEY PIPPIN APPLE.

This is a pretty apple of medium size, well flavoured, and early. It is the result of crossing Cox's Orange Pippin with Mr. Gladstone, and the fruit has a good deal of the appearance of the former variety, but is not so yellow and more conical. The eye is open, and has long segments set in a shallow and plaited depression; stalk short and fleshy, obliquely inserted in a shallow cavity, skin pale greenish-yellow, brighter on the sunny side, where there is a bright cheek composed of bright scarlet stripes and crimson mottlings. A.M., R.H.S., August 23, Messrs. J. Veitch and Sons, Chelsea.

THE CURRANT TOMATO.

Both for dessert and for its decorative value this is a most valuable tomato; its fruits are as large as small cherries, and borne in long pendant racemes like gigantic red currants, only lacking transparency, and having a vivid scarlet skin. The flavour is good and sweet. A.M., R.H.S., August 23rd. Mr. S. T. Wright, R.H.S. Gardens, Chiswick.

GARDENIA CULTURE.

The lovely and sweetly scented flowers of the gardenias are always welcome, and now that they are in season, a few words on their culture may be welcome to some would-be growers. Gardenias delight in plenty of heat, abundance of moisture and rich feeding, in fact, the gardenia and eucharis grow well together, the requirements of the one being exactly similar to the other. To begin with, I do not like old plants, as the flowers are never so fine after the second year, though they are fairly good up to five years; the plants, however, attain such an enormous size that it is a very difficult task to keep the foliage clean—not so much from insect pests as from the deposits from the water. In spite of this, a specimen with about one hundred blooms is a feature in a stove. Cuttings are best rooted in the spring, the young shoots being selected; these should be put in six-inch pots just within the rim, using plenty of sand and fine peat or leaf-soil; they will strike in a temperature of 65 to 70 degrees as easily as alternantheras. Keep them well syringed, and after they are rooted pot off singly using three-inch pots, this time giving them a compost of peat, loam, cow manure, and sand in nearly equal proportions; put the plants back again into a close pit, and as soon as they start into growth pinch the tops out, in order that they may break at the first joint. When these pots are filled with roots shift the specimens into five-inch pots, using compost as before; press the soil very firm when potting, and see that there are no insects to check the plants. They may be returned to the pit or house again with a temperature of not less than 70 degrees. Keep them well stopped, and do not neglect to syringe heavily at least twice daily, not merely wetting the foliage above, but also underneath, in order that the plants shall be kept clean which can be done by effective syringing. Another shift will compete the potting process for the first year, and in this case have the pots well drained, as the plants will remain in these pots some considerable time, and the longer the plant is to stop in the pots the better should the drainage be.

After this final potting for the season, and as soon as the pots have become full of roots, the plants should have a rest, which means a little less heat and a reduction in the moisture at the roots, but not less syringing. The specimens now should be capable of producing from three to four dozen flowers, and if flowers are wanted as early as they can be obtained, then, after a rest of a couple of months, give a few plants a top dressing of Standen's manure, and put them into a warm stove, and not far from the glass; if they can be stood on a fibre bed so much the better. Turn the plants round occasionally in order that the syringing may be directed immediately upon all the young branches, for cleanliness is the most important factor in growing gardenias perfectly. I have never yet seen an unhealthy plant that had been kept clean. After the flowers have all been cut the plants may be afforded one shift, but do not cut back; if too tall, then tie them down; or if large plants are not required throw them away. A two-year old plant is, I consider, the best when one has plenty of room for their development. All through the growing season the greatest care should be taken to keep them clean, for it is when the plants have completed growth that they are frequently allowed to become dirty, and then put on one side uncared for. This is the fatal mistake, for the gardenia needs plenty of attention always, and cannot at any time be profitably neglected. Gardenias should under no consideration be allowed to become dry, so that the leaves flag. To maintain a healthy stock we propagate a set every year, and throw away the oldest plants every season, immediately they have flowered.

Compton Bassett.

W. A. Cook.

NARCISSI.

These flowers, of which bulbs should be planted during the next week or two, are the peculiar glories of the spring. Early summer, also, owes to their later flowering forms much of its attractiveness. Their period of bloom is of considerable duration, extending through March, April, and May. As soon as spring has begun to assume its supremacy, after a long struggle with the forces of winter, and the all-creating warmth of sunlight reappears. The daffodils come to us with that tenderly graceful beauty, which filled the great heart of Wordsworth with rapture, and made Herrick weep that they hasted away so soon; because even their ineffable loveliness was, like all things beautiful, predestined to decay. I shall never forget the delight of Matthew Arnold, perhaps the nearest in spirit and in poetry of all modern singers to the "High Priest of Nature," when, as I walked with him on a day that will ever be radiant in my memory, through the woods of Surrey, we suddenly came upon an exquisite clump of that sweetest of the narcissi, the fragrant Poeticus, which is, perhaps, of all flowers of early summer, the most deeply beloved.

Such is the present popularity of the daffodil, that the cultivation of its fairest forms is almost universal. This ought to be a subject of self-congratulation to the earnest advocates of its beauty, and the successful hybridists. To Mr. Peter Barr we are indebted for some of the most graceful ornaments of our vernal gardens: notably the uniquely formed Triandus albus, or "Angel's Tears," with the tender, drooping grace of a cyclamen; and Narcissus Johnstoni Queen of Spain. We also owe to him that finest of all hybrids of its special class, entitled Narcissus Barri conspicuus, well worthy of being permanently associated with his name.

Of the trumpet section some of the grandest are Bicolor Empress, in size, form, and colour a near approximation to absolute perfection; Horsfieldi, raised by a Lancashire handloom weaver of that name, a variety of great substance and most impressive beauty; Bicolor grandis, worthy of its dignified name, perhaps the latest of this section to bloom; Emperor, one of the noblest of daffodils, with golden-yellow trumpet and perianth of a tender primrose hue; J. B. M. Camm, a very handsome [illegible] and Golden Spur, whose aspect is grace itself; John Nelson and Maximus, accounted the largest of them all. Very impressive, and exceedingly expensive, are Glory of Leiden and Madame de Graaf, whose prices, unless to the affluent among daffodil enthusiasts, are absolutely prohibitive; a description even more expressive of Weardale Perfection, advertised in the catalogue of the leading British cultivators of the narcissi at £12 12s. per bulb. Among those that may be called intermediate trumpets stand prominently Sir Watkin, of enormous size; Princess Mary, whose crown is yellow, while the beautiful perianth is silvery white; the single Incomparabilis, or "Peerless Narcissus"; C. J. Backhouse, a highly distinctive flower; Barri conspicuus, already eulogised; Duchess of Westminster; the Leedsi varieties, of graceful aspect; the late-flowering Nelsoni major; and the richly fragrant and prolific Narcissus odorus, sometimes called "the Great Jonquil," one of the brighest and best hybrids in garden cultivation. Small Trumpet narcissi are well represented by the exquisite N. poeticus, and is the predecessor of N. ornatus; N. grandiflorus præcox, the largest of this fragrant family; N. poeticus plenus, the "Sardinia" narcissus, which I find somewhat unreliable; and the handsome "Burbidgei" forms, which seldom fail to succeed. Without the odorous jonquils and the classical Polyanthus narcissi, of Grecian extraction, no garden would be complete.

The culture of daffodils is not very exacting, otherwise such splendid varieties as Emperor, Empress, Ard-Righ, Maximus, and Horsfieldi would not have such a wide distribution. In favourable situations these grow almost as freely as the Orange Phœnix, or the venerable Telamonius plenus, with much grander results. The more vigorous forms are very beautiful, and also highly picturesque when grown in woodlands and on lawns; the finer hybrids require a sandy, porous, somewhat fertile soil. Early planting and adequate drainage are of the utmost importance; also periodical prevention of that inevitable tendency of all narcissi—too crowded an accumulation of superfluous bulbs, decrease in flowering capability, and ultimate decay.

David R. Williamson.

POTATO EXPERIMENTS.

Our esteemed friend and critic "Lux" regrets that the Ontario Agricultural Department did not give in our recent report on potato experiments (see Gardeners' Magazine, July 23rd, page 476) the weight of the sets employed.

This part of the enquiry has, however, not been neglected. In 1895 and in 1896 an experiment was conducted in which potato sets one-sixteenth, one-eighth, one quarter, one half, one ounce, and also two ounces in size were planted side by side. No piece contained more than one eye. The object of this experiment was to ascertain the influence of the size of the potato sets on the crop produced. The varieties used in 1896 were the Empire State, and the Pearl of Savoy, which were planted on May 27, in rows four rods long and twenty-six inches apart. The potato sets were planted to a depth of about four inches, and flat cultivation was used throughout. The following is the result:—

(One eye in each set.)		Percentage of whole crop marketable Per cwt.	Yield of Potatoes per acre. Bushels.
Each set containing	1·16 oz.	87·5	60
,, ,,	1·8 oz.	94·6	105
,, ,,	1·4 oz.	94·6	138
,, ,,	1·2 oz.	94·0	145
,, ,,	1·0 oz.	92·0	165
,, ,,	2 0 oz.	89·3	182

The results in the above table are very interesting, and show the great influence which the size of the potato sets have upon the amount of the crop produced. The smallest-sized pieces produced decidedly the smallest yield, and there was a gradual increase according to the increase in the size of the seed tubers. The two ounce sets gave the largest yield per acre, although the percentage of marketable potatos was somewhat reduced in this experiment.

An experiment has been conducted for two years in succession, to obtain some information in regard to the influence of the number of eyes on pieces of potatos as affecting the succeeding crop. Potato sets of one ounce in size were used throughout the experiment, and on number one plot the sets contained one eye in each piece; on number two plot, two eyes; on number three plot, three eyes; on number four plot, four eyes; on number five plot, five eyes. The Empire, State, and Pearl of Savoy varieties were used in the experiment. The land was similar in character, and the cultivation was of the same nature as for the previous investigations.

The potatos were planted on May 27th, and the following is the result:—

	Average yield of Potatos from each Set. Acres.	Average yield of Potatos from each Eye. Acres.	Yield of Potatos per acre. Bushels.
Each potato set containing:—			
1 oz. and 1 eye	7·28	7·28	158
1 ,, 2 ,,	8·00	4·00	176
1 ,, 3 ,,	7·88	2.64	182
1 ,, 4 ,,	7·74	1.72	186
1 ,, 5 ,,	8·63	1.75	198

In the foregoing table it will be observed, in the first column of figures to the left, that the average amount of potatos from large seed was fairly uniform, regardless of the number of eyes in each set. It will be seen that the results of this experiment and those of the preceding experiments, point very strongly to the conclusion that much more depends upon the comparative size of the potato sets which are planted than upon the comparative number of eyes on the sets. The results are quite regular throughout, the largest yields being produced from the largest potatos, and the smallest yields from the smallest potatos which were planted.

I have an experiment with potatos in my own garden at Harpenden this year, which confirms, most strikingly the results obtained at the Ontario experiment section.

Harpenden.

J. T. Willis.

VEGETABLES FOR EXHIBITION.

VEGETABLE MARROW.

THE vegetable marrow (*Cucurbita Pepo ovifera*) constitutes one of our favourite summer vegetables, and few are more quickly or easily grown; then almost any out of the way corner, unsightly rubbish or manure heaps may be utilized for the purpose, producing at the same time a very pleasing effect. They also make admirable screens when trained up trellis work, fences, or even old buildings, and with plenty of convenience, marrows may be had from the beginning of April until the frost puts an end to their growth. Selection of varieties, either for home consumption, market, or exhibition is of the utmost importance; there is a large number, many of which are almost worthless (judged either by their flavour, productiveness, or appearance) compared with the newer or best selected sorts. The vegetable marrow is a moisture and heat-loving plant, and during spells of hot dry weather too much water either at the roots or overhead can hardly be given. If allowed to suffer from drought mildew—one of the most deadly enemies of the marrow—will quickly make its appearance and greatly damage the crop.

When means are at hand, a few plants should be cultivated under glass, in houses, heated pits, or frames placed on hotbeds. For this purpose seeds should be sown singly in pots two and a half inches in diameter the first week in February and again in the middle and end of the same month in bottom heat. Encourage a sturdy growth by placing them near the glass as soon as the seed-leaves are above the soil; pot on when ready into thirty-two sized pots in a light porous soil, and support each plant with a stake. For the first cutting a few plants should be grown and fruited in ten-inch pots, training them up in the lightest position available in the forcing house. Too much heat must be avoided, or much growth and few fruits will be the result. A safe temperature will be from 55 degrees as a minimum to 70 degrees as a maximum with sun heat; very little bottom-heat, if any, will be required. The principal growths should be stopped, and the fruit fertilised in the same way as advised for melons. Early marrows are always appreciated, and deserve to be more extensively forced than they are. For a succession a few lights of pits or frames may be profitably employed. I much prefer a mild hot-bed for frames, and this should be made principally of leaves, as such may be easily lined with manure to create more warmth, if required. Abundance of air should be given on all favourable occasions, but avoid cold cutting winds. Later on, as the days lengthen and the weather is safer, the frames may be removed altogether (of course, hardening the plants gradually as much as possible beforehand) and used for other purposes. Some temporary protection must be afforded the plants in case of frost, but later on they may be allowed to ramble at their own sweet will, and then large quantities of early marrows may be looked for weeks before they can be obtained when grown in the ordinary way. If kept well supplied with water, and now and then treated with some mild fertilizer they will continue to bear till late in the autumn.

For the general crop the seed should be sown the second week in April in heat, and for the latest supplies, when no heat is available, the first week in May. It will not be safe to plant them out in the open before May 20, unless some means are at hand for protecting them. I know of nothing better than ordinary handlights, as they not only give the plants a good start but are just a sufficient protection against hard weather. Remove the covers by day, and replace as required, taking them off altogether when safe to do so. But even handlights are not within the reach of all who cultivate the marrow, so that some other means must be employed. A capital plan—which we often adopt—is to drive three stakes, draw and tie the tops together about three feet above the plants, when mats or any other protecting material may be placed over them and made secure. There are many modes of preparing and growing vegetable marrows, most of which produce more or less good results. Many practice taking out wide trenches and filling them three parts full with manure, placing the soil on the top. This is a very good plan, especially on very dry and exposed sites, and where water is not plentiful; but I much prefer just the opposite method of making up ridges about three feet in height and four feet in width, and for this purpose anything and everything in the way of rubbish, such as old hot beds, &c., may be utilised. We make it a rule to clear up rubbish and soil yards for the purpose, forming them in the most convenient spot vacant. We allow a distance of three feet from plant to plant, giving each two or three shovelfuls of loam and leaf soil to afford them a start. The plants will require stopping and pegging down for a week or two; then, with the exception of giving them plenty of water, no other attention will be required. Any unsightly heaps may be treated in the same way, and not only will they yield profitable returns, but give a pleasing and refreshing effect. Some people, to avoid trouble, sow the seed where they intend the plants to grow; this is a poor method, and not to be recommended. Far better to sow in pots, even if the cultivator has no glass, as one has much better control over them, and few plants are more delicate and less able to take care of themselves in a young state.

Vegetable marrows for shows held during May, June, and the early part of July, form an invaluable dish in a collection of vegetables, but after this time only in very large collections should they be included; still in many shows prizes are offered for single dishes, and generally speaking very fine display is produced. Frequently among amateurs and cottagers large and coarse varieties seem to be the first consideration, but this ought not to be encouraged, as quality should be the principal aim. Marrows are generally exhibited in pairs, and like cucumbers the two should be as near alike as possible. They should be looked after and watched as soon as the fruits are formed, great care being taken not to scratch or damage them in any way, either during the time they are swelling, or when cutting, otherwise their appearance will be spoiled. Should one be outgrowing the other, it will be perfectly safe to cut it two or three days earlier, carefully placing the stalk in about half-an-inch of water, and keeping it in the cellar, or some cool place. The fruit should be of medium size, according to the variety, as near alike as possible, fresh looking, and the rind quite tender near the stalk, so that the thumb-nail may easily pierce it; they must be of good shape and free from all marks or scratches, and, if possible, shown with the remains of the flower on them. White skinned kinds are generally preferred to green ones, but I see no reason why this should be, though where possible, prizes should be offered for each. For an ornamental arrangement several kinds should be included, and I prefer to stage them on a medium-sized dish, nicely garnished with bright green parsley. The varieties I recommend are, for forcing, Moore's Cream, a free setting medium sized variety, of nice appearance, and of excellent quality, but it must not be allowed to remain on the plants too long, as much of the fresh appearance will be lost; Prince Albert is a splendid green kind for forcing, and of fine quality. These varieties are equally good for general cultivation. A good selection of Long White and Carter's Long Green are fine for exhibition purposes, during summer and autumn, as also for any purpose. The best flavoured variety, however, that I know, is Pen-y-byd, and it deserves a place in every garden, but, as a rule, it is not looked upon favourably by the judges. The old Custard, when room can be found, should also find a place, as it is very attractive and ornamental, especially so when ripe.

Aldenham House Gardens. E. BECKETT.

FRESH HOMAGE TO THE GOLDEN FLOWER.

WE have already briefly alluded to the recent formation of the Italian National Chrysanthemum Society, and have now received the first number of its journal, which is, indeed, a very creditable and well-printed publication. The proper title is "Società Nazionale Italiano del Chrisantemo," and its headquarters are at Milan. On the title page appears a list of the officers and committee, among whom we note several well-known names. Then follow the rules and constitution of he society, from which we gather that the work and scope of the society is based upon somewhat similar lines to those of the French N.C.S.

The list of members amounts to about one hundred and sixty—not a bad start for a new society, whose first exhibition is to be held next autumn at Milan, after which we may reasonably hope to see a considerable increase. That the society is deserving of sympathetic consideration at the hands of growers other than of Italian nationality may be found in the fact that its members already consist of well-known chrysanthemum men in England, France, and Switzerland, the most familiar to our readers being such names as Messrs. Briscoe-Ironside, Calvat, Cordonnier, Owen, Harman Payne, Rozain-Boucharlat, and W. Wells.

In Belgium, M. O. de Meulenaere is still busy cataloguing and classifying the novelties year by year, and he has just issued his third supplement of novelties from every source for the years 1896-98, thus bringing his previous labours close up to date. Mr. de Meulenaere's work runs into thirty-six pages, and is a handy, well printed little brochure, similar in every respect to previous editions.

The papers read at the Orleans Conference last November held by the French N.C.S. have recently been reprinted and issued in separate form. The subjects dealt with are diseases and parasites, fertilisation and manures, and composts.

The last number of the same society's journal, "Le Chrysanthème," contains an announcement to the effect that the Swiss growers are determined to have their N.C.S. too. Arrangements have been made to hold a show at Geneva next autumn, and a schedule has been prepared and circulated, together with the rules of the new society. M. Louis Verreard is the secretary.

With regard to the Paris Chrysanthemum Committee, the last number of its journal contains rules and schedule for the show in November. Also articles on early chrysanthemums, the large flowered chrysanthemum, a report of a visit to M. Molin, of Lyons, and a list of the members composing the committee, which, as most of our readers are no doubt aware, has been constituted by the National Horticultural Society of France.

C. HARMAN PAYNE.

Coleus as Pot Plants.—The introduction of the tuberous begonia did very much to help kill the taste for coleus, once so strong. No doubt it was so because these plants were rather done to death, especially in the form of trained pyramids and bushes at exhibitions. But seed stocks give great variety, and many beautiful things that are really charming as greenhouse plants. I saw recently in a show at Reigate two or three plants, each about sixteen inches in height, raised from seed, that had superb leafage, wonderfully coloured, which could have created a sensation a few years back. Myriads of foliage plants have been sold at half-a-guinea each that were not nearly so beautiful as these coleus. Plants bloom freely and seed freely. Those who do not care to save seed can purchase, and if the seed be sown in warmth in February, numerous plants result.—A. D.

The Birch for Avenues.—The White Birch (*Betula alba*) is, without doubt, one of the most beautiful objects in the British landscape, and it is a pity it is not more frequently seen employed either in the pleasure grounds or to form avenues in the park. Where it succeeds the white birch grows into a large tree, and with its drooping habit, tufted growths, and white trunk, it is both ornamental and interesting. At Broxton, or rather between Broxton and Bickerton, Cheshire, there are some of the finest specimens in the hedge rows by the roadside that I have seen. Near Harthill there is one tree about seventy-five feet in height, with a trunk three feet in diameter seven feet from the ground. The trunk is free from branches to a height of eighteen feet, and then throws out several trunks or strong branches forming a head covering a space of over twenty yards in diameter. The pendulous habit of the birch is shown off effectively in such a specimen as this. The geological formation is red sandstone, forming a sandy loam of a very fertile character and well suited to the growth of all our forest trees. In this soil larch, oak, sycamore, Scotch fir, and beech, as well as the birch, grow luxuriantly. On soils of this nature the birch is sure to succeed, and would form a most effective avenue —CESTRIAN

IMPROVING STRAWBERRIES.

IMPROVEMENT is the order of the day, and in the horticultural world the demand for novelties that show an advance on varieties previously grown is constantly increasing as the knowledge of, and interest in, gardening extends. Commercial horticulturists fully recognize this, and have been practically compelled to render selection, cross-breeding, and hybridising, an important department in all the largest businesses. It is a most expensive department too, for though some prizes are secured, the blanks are numerous, and it is only where the work is carried out systematically and extensively that anything like an adequate return can be secured. Even when something valuable is obtained, it often has to be put in the market so early that sufficient stock cannot be raised to bring the return that the skill, labour, patience, and expense required should command. The public reap the advantage, and that is probably shared by rival tradesmen, for when once a plant is "sent out," if it admits of ready propagation, the raiser's prior claim is lost. It is a fact familiar to many readers of the GARDENERS' MAGAZINE that hundreds of plants have been put into commerce, which might have yielded their raisers a handsome fortune had they been retained until the stock was sufficiently large. But novelties of sterling merit have an unpleasant way of "leaking out," as it were; sometimes, too, they are strangely duplicated in other parts of the country, and these risks render nurserymen shy at keeping their productions long enough in hand to reap a full reward for their efforts. When, however, surprise is expressed at the prices charged for novelties, it is due to a defective knowledge of the outlay requisite to produce the results, and it is only necessary to raise the scene on the field of the hybridist's labours to convince any impartial person that the real surprise is that prices are not much higher.

Especially do these remarks apply to the work devoted to raising new strawberries in comparatively recent years. The late Mr. Thomas Laxton was without question one of the most skilful and successful hybridists of the present century. A close student, with a keen interest in his work, methodical and far seeing, he added many valuable plants to our gardens that have well maintained their place against a host of rivals. It seems a quite long period since I paid my first visit to his experimental gardens, at least the sons who now carry on the business were small lads; but it was then that I had the first knowledge of what he had attempted and accomplished amongst strawberries. The rows of seedlings from crosses between the best known varieties, always made with some definite object in view, were a source of the greatest interest, and the careful records kept of the parentage, the reversing of the crosses, together with the testing of the results by repeated comparison with other varieties, proved that a good deal more than the mere seeking for commercial returns was the guiding power in such an undertaking. In the course of some thirty or forty years, Mr. Laxton claimed to have raised ten thousand seedling strawberries by cross-breeding, only nine of which were sent out; yet up to 1885 the most remarkable variety obtained was Noble, a chance seedling between Forman's Excelsior (itself a seedling from James Veitch) and Sharpless. Well might Mr. Laxton remark that "such results are not altogether satisfactory, or, I may feelingly add, profitable." Yet had this chance seedling been increased [illegible] a large stock had been at command, a fortune might have been realised by its [illegible], though it is now surpassed by later acquisition. One of the best known varieties raised by the founder of the firm was Captain, which resulted from a cross between Crown Prince and the seed parent of Noble, *i.e.*, Forman's Excelsior, [illegible] now this is a favourite with many, its good shape, bright colour, and [illegible] being well-marked qualities, though usually it does not crop so freely as [illegible] desired.

The work so well begun by the father has been carried on with the keenest intelligent interest by the sons, Messrs. Edward and William Laxton, and a recent visit to the extensive seedling and trial grounds at Bedford showed in a convincing manner that they have taken full advantage of the long experience at their [illegible]. Whereas, in the early days, a small area sufficed to contain the [illegible], we now find a field of several acres devoted to the testing of the [illegible] from hundreds of distinct crosses. Amongst these are many which [illegible] of the greatest promise, either for the size, colour, flavour, earliness, or cropping qualities, but they are subjected to a most rigorous trial before the verdict is given that they may be submitted to the public. After a careful examination, one would be inclined to the decision that a large proportion are worthy of distribution, and the task of selection becomes much more difficult when the seedlings are of such nearly equal though varied merits. By long-continued intercrossing of the best types, a very fine strain or race has been formed, but it is strange to note the range of variation shown in many cases by the seedlings from one parentage. Mr. W. Laxton thinks that, as a rule, the pollen parent exerts the greatest influence on the progeny, but it is not uncommon to find amongst the seedlings more marked characters as regards size, colour, flavour, and season, than are possessed by either of the parents. From my experience and observation, It seems very difficult to even guess at what may result from a certain cross amongst strawberries, for they seem so thoroughly disturbed in constitution that the seedlings play the strangest vagaries in their variations and reversions. When a race like that at Bedford is obtained, selection is quite as important as crossing, and constant watching for distinct acquisitions is needed to detect the advances. Fortunately, however, when the seedling is obtained it does not itself vary; a year or two may be needed to prove it thoroughly, but then the propagation by runners form suitable plants, and good cultivation ensures its constancy. Speaking from a knowledge, nearly all the varieties in cultivation, I can say that few have altered materially in character by prolonged cultivation, except it can be traced to neglect in cultivation or propagation.

Another department of this interesting strawberry business is that where runners are raised for forcing or planting, and great attention is paid to this because something like one hundred thousand are required every year in pots. An area of fourteen acres is occupied with plants for runners—fine open, breezy fields—where young, vigorous, but fertile plants are solely employed to furnish the supply. This is quite as important, as in the case of other plants, starting with sturdy cuttings or well developed ripened seeds; but it is not always recognised in private cultivation, and many a failure, both with forced and outdoor plants, is traceable to want of due care at the runner stage, rather than to after-cultivation. This is understood thoroughly at Bedford, and provision is made accordingly to guard against the chief evils.

To enumerate the varieties which have made the name of Laxton familiar wherever strawberries are grown would be a long and needless task, but there are three of the newer sorts that deserve a word or two. One of these is Monarch, which, besides possessing large and handsome fruits and good cropping qualities, has an excellent constitution, which can be fully appreciated where mildew is a source of trouble. The beds of this variety at Bedford have a grand appearance, and as a well-flavoured main crop out-of-door strawberry it is certain to take a high place. Similarly Mentmore seems destined to become a favourite for forcing, as the influence of one of the parents, British Queen, is found in its fine flavour, though the colour is better—a rich crimson—apparently derived from Noble. The last of the trio is a still more recent novelty, and has been appropriately named Fillbasket. It is extremely prolific, and as it is derived from Royal Sovereign and Latest of All it ought to be, as it undoubtedly is, a variety of sterling merit. It is a useful late midseason strawberry, and will find a welcome place in many gardens.

FRAGARIA.

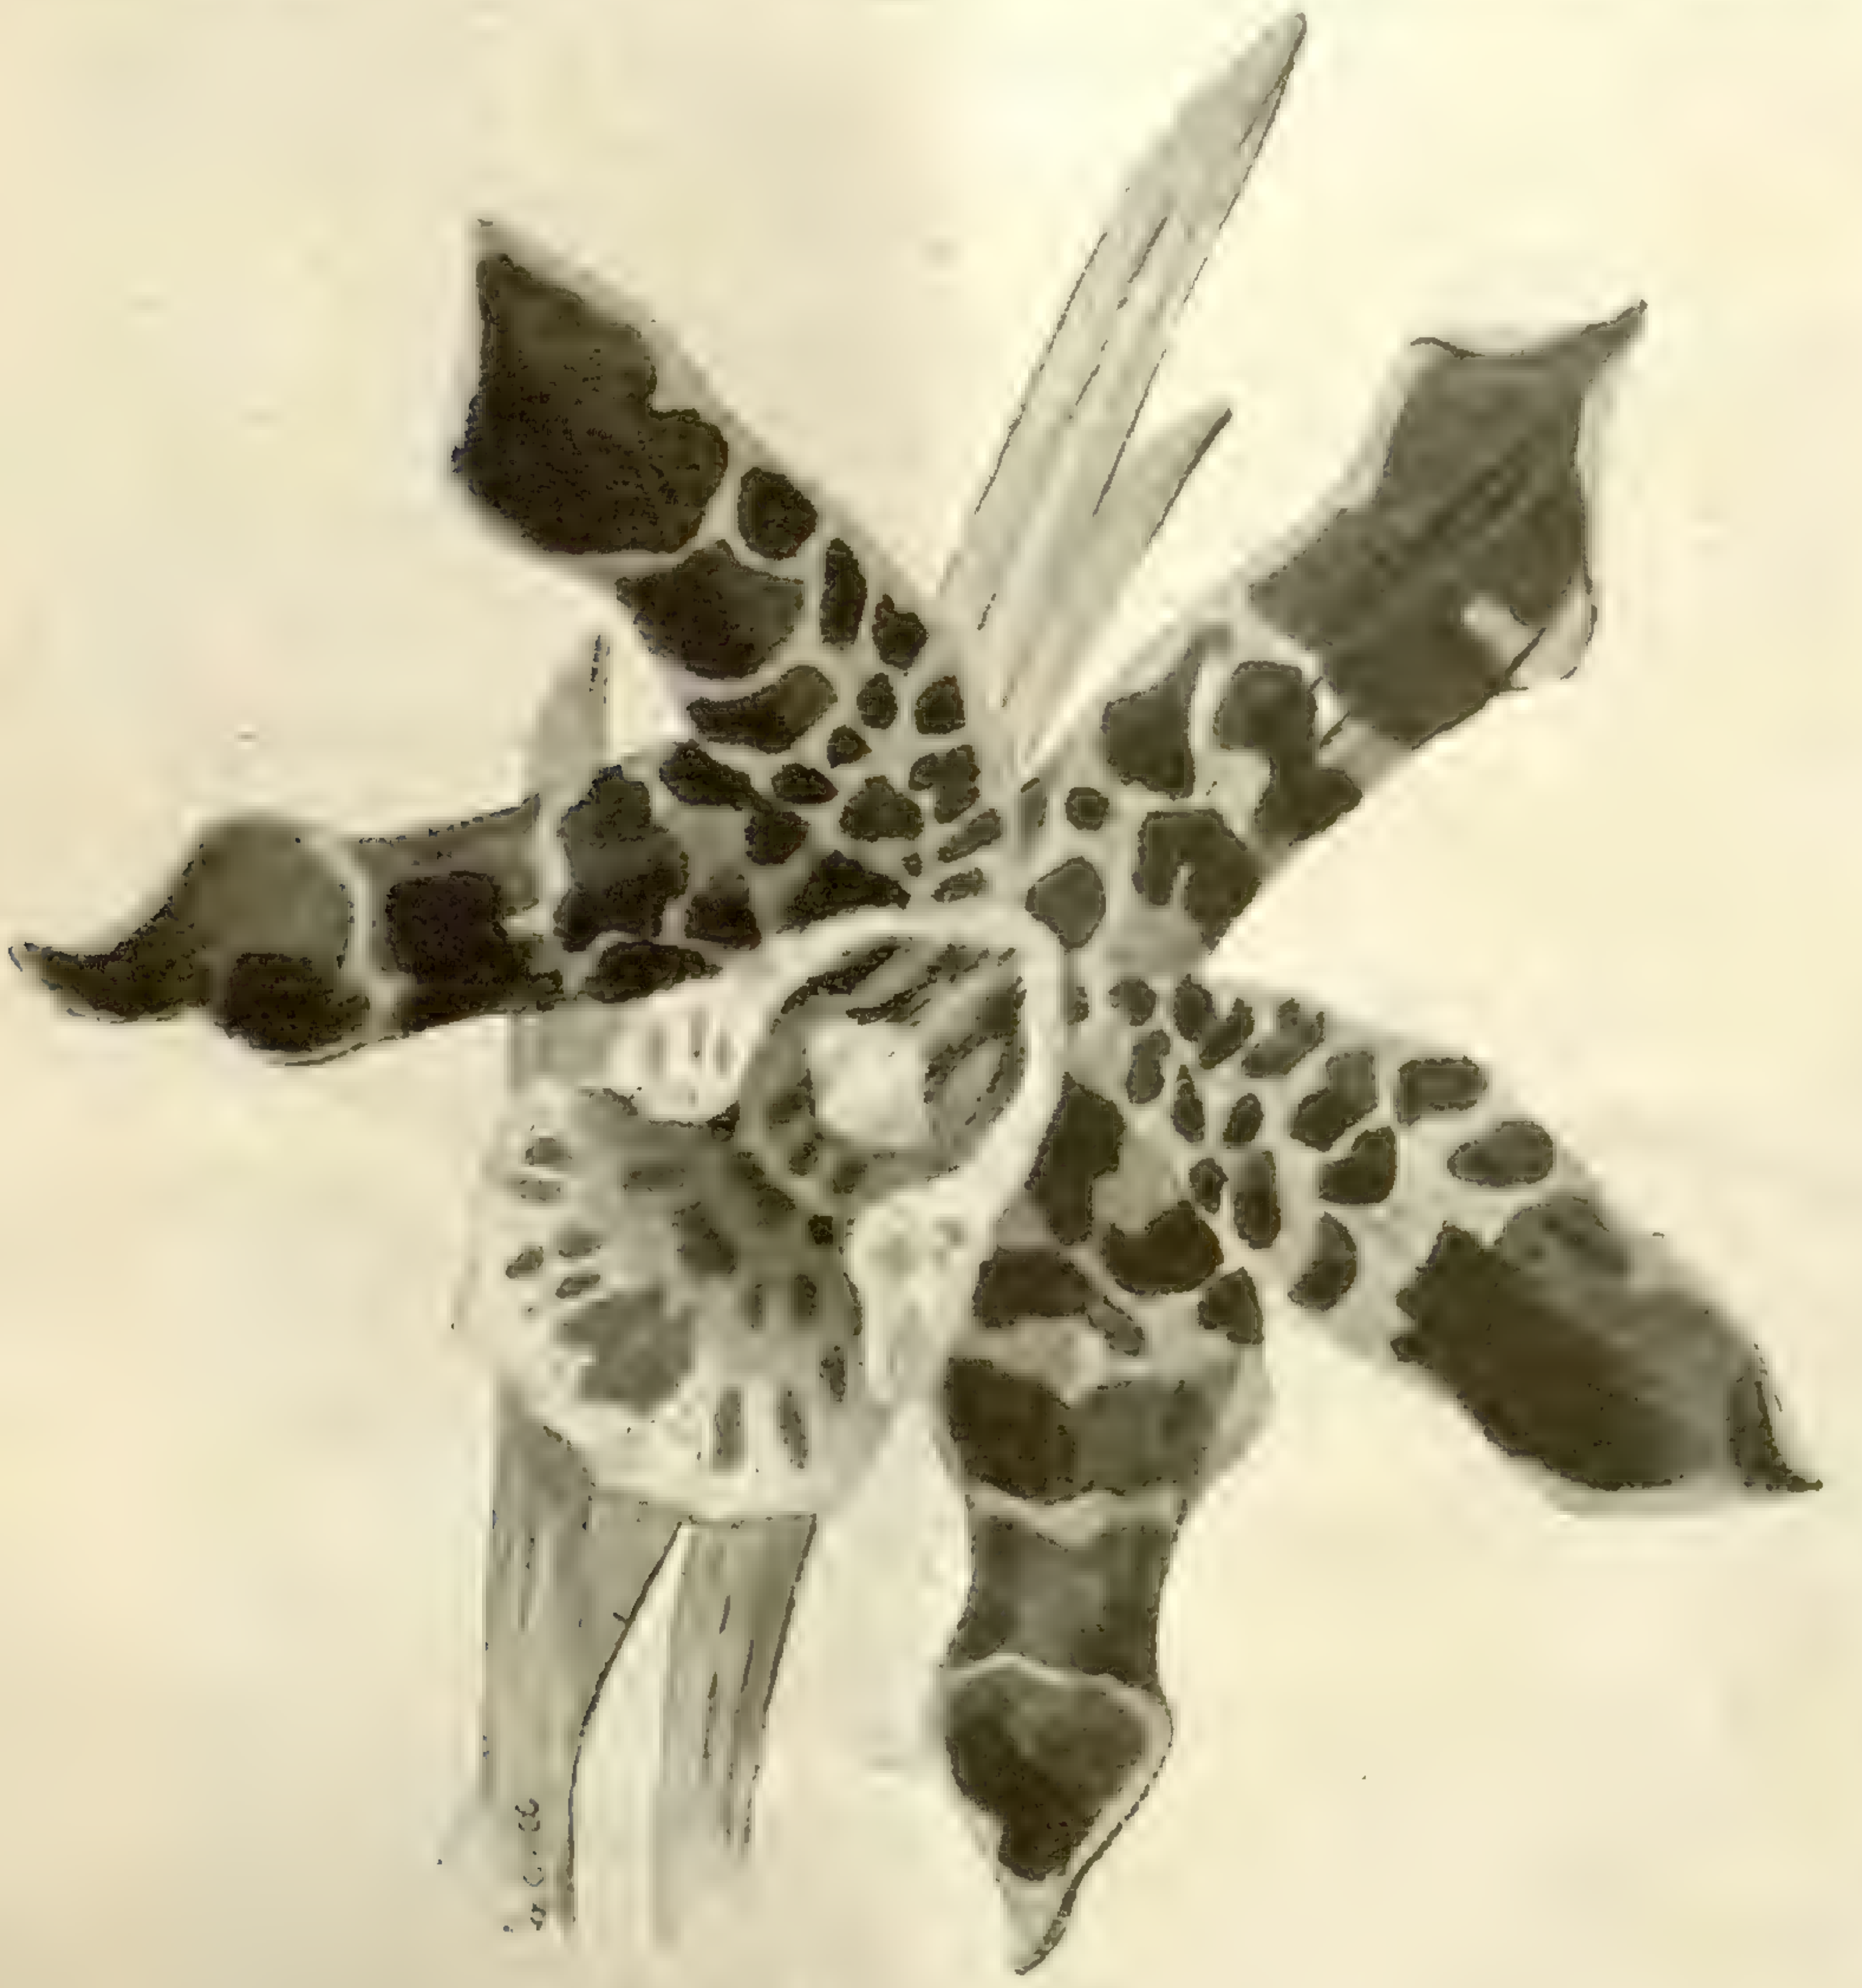
A PLANTATION OF HYBRIDISED SEEDLING STRAWBERRIES IN MESSRS. LAXTON'S TRIAL GROUNDS

Godetias.—How wonderfully these beautiful hardy annuals have been improved since they first became generally grown. Such varieties as Lady Albemarle, Duchess of Albany, Satin Rose, Apple Blossom, and others furnish remarkable masses of exceeding beauty when thinly sown or planted out from the seed bed. Last year a superbly coloured dwarf and remarkably free-flowering variety, named Gloriosa, received a reward of merit at the Drill Hall, though but two or three plants were shown. I saw a large bed of this beautiful form at Messrs. Sutton and Sons', seed growers, Reading, recently, and was pleased to find how remarkably true to character the stock was. This is a deep rich crimson, and the broad dwarf plants when in full bloom produce most striking effects. It makes a grand companion plant to the dwarf Duchess of Albany.—A. D.

NOTES ON ORCHIDS.

SCUTICARIA HADWENI.

THIS remarkable orchid was introduced about 1850 by Mr. Hadwen, of Liverpool, who obtained it from Rio de Janeiro and succeeded in flowering it in 1851. Not long afterwards a south London grower, Mr. Miers, of Hammersmith, secured plants from Southern Brazil. and since then the species has frequently been imported with Brazilian orchids, though seldom in any great quantity. It was originally named Bifrenaria Hadweni, and, by reason of its stipitate pollina, it is closely allied to that genus. The peculiar habit of the plant places it, however, in the genus scuticaria, though its habitat is far removed from that of its companion species, S. Steeli. The leaves are fleshy and texete, nine to eighteen inches long. The flowers vary from two to three inches across, greenish-yellow, heavily blotched and barred with chestnut-brown; the lip is creamy-yellow, white at the apex, and spotted with brown and rose. Scuticaria Hadweni is not a difficult orchid to grow; it requires plenty of sunshine, abundance of water when growing, a block to grow on, little material about the roots, and an intermediate temperature. Mr. Young, orchid grower to Sir F. Wigan, Bart., Clare Lawn, East Sheen, manages this orchid finely and from a specimen that recently flowered under his care our present illustration was made.



SCUTICARIA HADWENI.

ODONTOGLOSSUM WILCKEANUM LINDENI.

This handsome odontoglot came to light among the importations of Messrs. L. Linden and Co, at Moortebeek, and was exhibited, when in flower, at London and Manchester in April last, receiving a first-class certificate from the Manchester Orchid Society. The flowers are of large size, elegantly fringed and waved; the segments are creamy white with very large irregular blotches of red-brown or purple-brown; the long lip has a yellow centre and white margin with vivid red brown spots of various sizes. *Lindenia*, t. 617.

PHAIUS NORMAN.

A beautiful orchid is Phaius Norman, obtained by crossing P Sanderianus with P. tuberculosus, the hybridist being Mr. Norman Cookson, Wylam-on-Tyne. As already stated in our columns, the stock passed into the hands of Messrs. Charlesworth and Co., Bradford. In our issue of March 12 last we described this phaius, which is named Phaius Norman and not P. Normani, as given in the *Lindenia*, t. 618. In our issue of March 19, 1898, we gave a full-page illustration of P. Norman, but the editor of *Lindenia* has entirely omitted to include this in his list of references. The plate in our Belgian contemporary is a good one, the crimson and gold in the lip and the rose-tinted sepals and petals lending themselves well to lithography. We may add that in several instances this orchid has been described as P. Normani, but it was certificated as P. Norman and referred to as such in the latest issue of the R.H.S. journal.

ACANTHEPHIPPIUM CURTISI ALBIDUM.

As a rule the members of the genus acanthephippium are not loved by horticulturists; they are interesting orchids but not showy or floriferous enough for inclusion in the majority of orchid collections. Acanthephippium Curtisi albidum is from the Malay archipelago; the species flowered at Chelsea in 1881, and the present variety at Brussels in April last. The latter has stout pseudo-bulbs surmounted by large, plicate, light green leaves, not unlike those of calanthes. The flowers are thick and fleshy, the lateral sepals joining to form a large pouch-like organ; the colour is white with a creamy tint, and on the inner surface of the segments are numerous small dots of bright rose and rose-purple. The spike, bracts, and pedicel-like ovaries are all deep and bright purple. *Lindenia*, t. 619.

CATASETUM SPLENDENS LANSBERGEANUM.

This is another of the splendid natural hybrids from Catasetum Bungerothi that now make quite a series under the title of C. splendens. The series was introduced by Messrs. Linden and Co., L'Horticulture Internationale, Brussels, and several of the leading forms have been figured in our columns. The form named C. splendens Lansbergeanum has large white petals freely marked with small rose spots and tipped with reddish-rose. The sepals are creamy-white, while the large concave lip is deep yellow, shaded with bright brown along the upper border and base. It is apparently a most vigorous orchid, for the illustration in the *Lindenia* t. 611, represents a spike with eight large flowers. This variety is named after the president of L'Horticulture Internationale.

A COMMON PLANT OF THE SEASHORE.

ALL visitors to the seaside are familiar with the *Fucus vesiculosus*, or common bladder wrack, daily left on the beach at low tide, but few are aware of the novel and beautiful phenomena constantly taking place in connection with it under their very eyes. It furnishes a beautiful example of the nature of the process of reproduction in the lower class of plants, being indeed a member of a tribe which stands at the very threshold of the vegetable kingdom, the Cryptogamia. When examined through an ordinary microscope in winter time, the greenish-black fronds of the bladder wrack are seen to be studded at their extremities by little egg-shaped hard prominences, consisting of nearly spherical cavities under the epidermis, or skin, opening at the surface by a minute pore. These are receptacles. Those containing the antheridia are on separate plants from those containing the oogonia. The latter are the same colour as the frond, the former yellowish-brown. They must not be confounded with the air cells, which also cover the tips of the fronds.

If a vertical section be cut through a male receptacle, and examined by means of a high magnifying power, the cavity will be seen to be nearly filled with branched jointed hairs, bearing numerous little ovoid cells, of an orange colour, each containing a number of minute bodies, with an orange speck or granule in the centre. These are the antherozoids, and the cells in which they are deposited correspond to the anthers in flowers, hence their name of antheridia. When fully formed these cells burst, discharging their antherozoids, which swim rapidly in water by the motion of a pair of long cilia, or hairs, attached to one extremity. If a female conceptacle be prepared in the same way, and examined, it will be found to have a similar lining of jointed hairs, among which are several large ovoid olive-coloured bodies, attached by a short pedicle to the wall of the cavity. These are the germ cells, or sporangia. When completely developed, each consists of a transparent coat formed of two thin membranes, and a central opaque olive-brown body, presenting marks of division into eight parts, hence called an octospore. When ripe, the oogonia burst and set free the oospheres, which are expelled like the antheridia, and collect these into jelly-like green masses round the orifice of the receptacle.

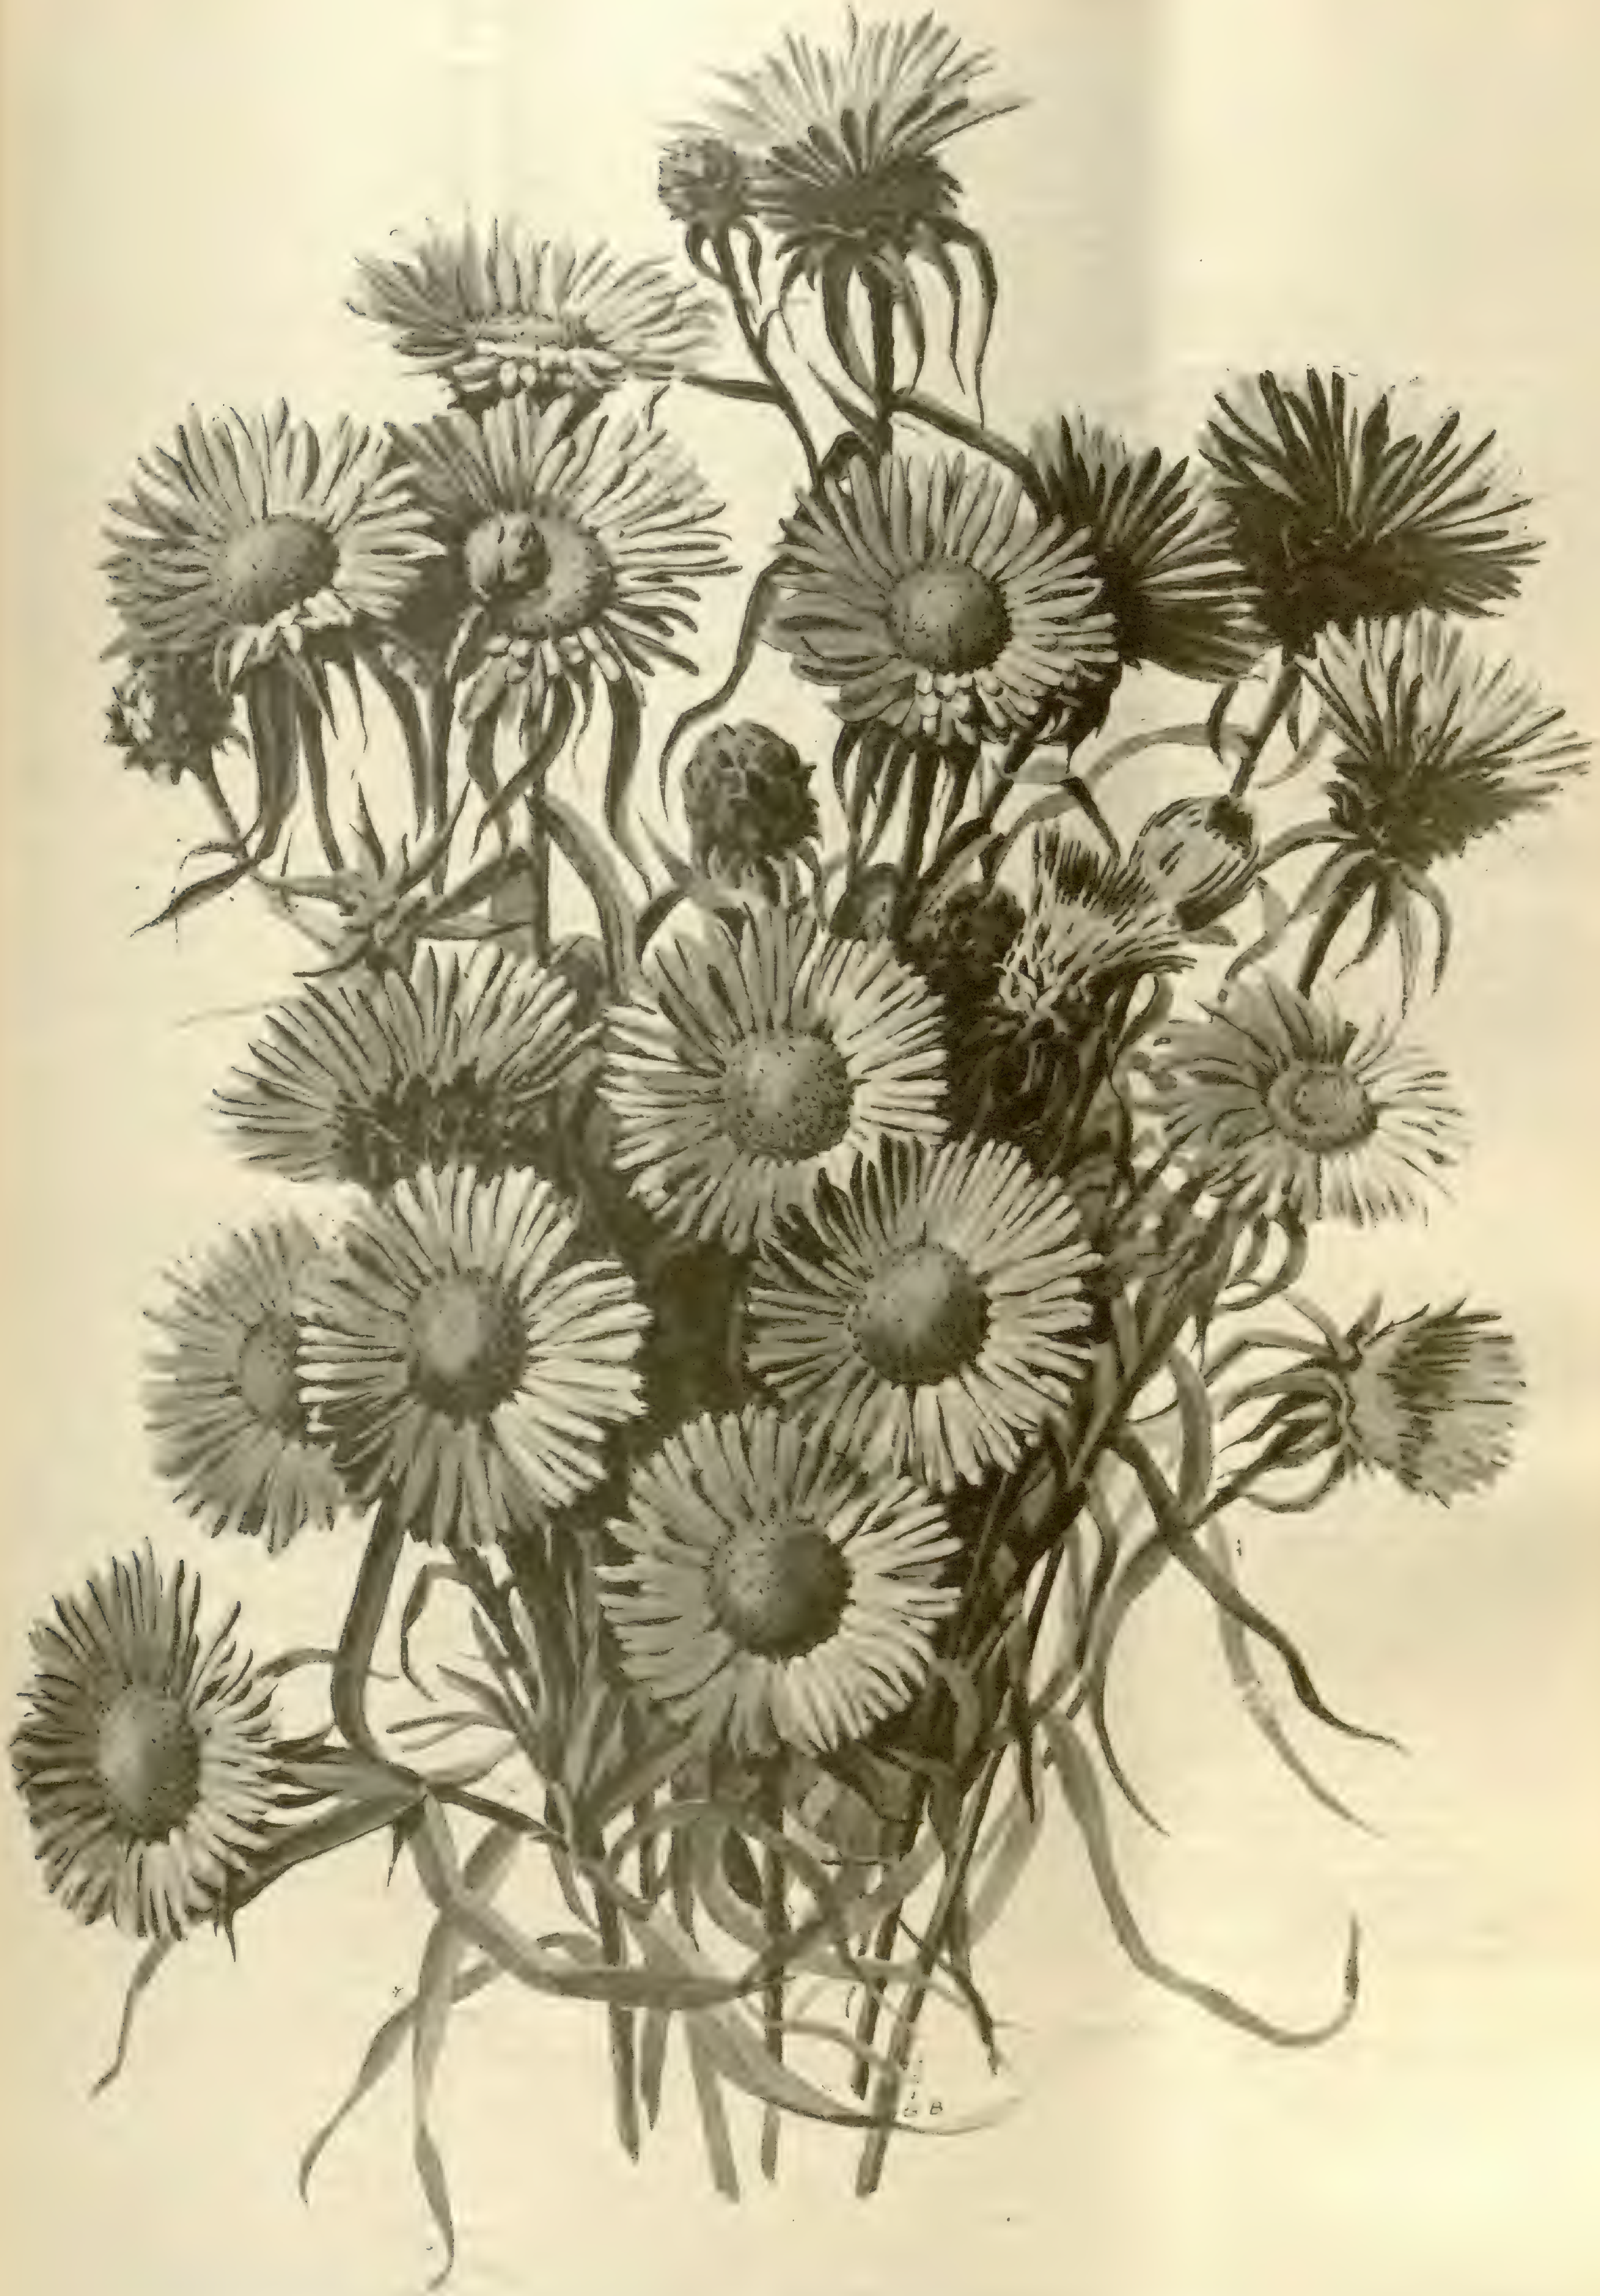
If a small portion of this green jelly be held on a needle and placed in a little sea water, it will be seen under microscopic examination that the spores in each oosphere will become spherical, and in about half-an-hour the membrane will burst. The spores, however, still remain in a very delicate transparent bag, which was not visible before, and this is attached to the ruptured outer coat at a point which resembles the hilum of a seed—the spot at which a seed is attached to the fruit. In a few minutes this envelope gives way, and the naked oospheres then float about freely in the water. Now, let a minute portion of the orange-coloured jelly from the male receptacle be introduced into the water where the spores are, and a very singular phenomenon immediately takes place. The antheridia almost directly burst and discharge their contents; the liberated antherozoids swim with their arms or cilia, and are soon seen to settle on the oospheres in great numbers. The next day the oosphere will be found split into hemispheres by a transverse division, and a little rootlet will be found to have already begun to sprout at right angles to the division. Again, the day following, the oosphere will have become elongated and several more transverse and vertical divisions will have made their appearance. The little bud will now have developed into a long transparent rootlet. Watching the curious young plant daily, it will be seen that it continues to elongate by multiplication of its cell contents, putting out more rootlets, and a few days later a bundle of transparent, hair-like sprouts will shoot from its summits. The whole plant then presents the ordinary appearance of one of the young plants we are familiar with, and find on rocks and stones where seaweeds grow, and to which they attach themselves. If one of these is placed in a glass of sea-water it will continue to vegetate for some months, or if removed to a vivarium it will grow and thrive.

Other *fuci* found on the coasts present the same phenomena as the one we have related. In some kinds both male and female receptacles are found on the same plant, and in *Fucus plutycarpus* both male cells and germ cells are in the same receptacle. In fact, throughout the whole of the cryptogamic class of plants a mode of reproduction as perfect in its type as this is found, though varying infinitely in its forms, and this, as we ascend the scale, increases in resemblance to ordinary inflorescence.

WM. NORMAN BROWN.

INULA ENSIFOLIA.

NOT very many species of the genus Inula are cultivated to any great extent except the well known I. glandulosa, I. Helenium, I. Hookeri, and I. oculis-Christi. To these, however, the dwarf-growing I. ensifolia might well be added wherever perennial hardy plants are admired and yellow flowers are in demand. It has a most compact habit, the flower stems being much branched, erect, and wiry, so that no staking is necessary to uphold the brilliant yellow composite blooms that are produced with wonderful freedom. I. ensifolia, also known sometimes as [illegible] nana, seldom grows more than a foot high, and is by no means particular as to soil, but, like most other hardy herbaceous plants, it succeeds better under a little kindly treatment, its blooms then being larger than usual. The foliage is also of a neat character, quite distinct from that of I. Helenium or I. glandulosa, as a glance at the accompanying illustration will show. The blooms figured were supplied by Mr. Amos Perry, Winchmore Hill, N., who exhibited a well-selected form at a recent R.H.S. meeting. I. ensifolia is a South European plant, and though seldom seen in gardens, was introduced from Austria over a hundred years ago, the date being given as 1793.



INULA ENSIFOLIA.

RARE HARDY PLANTS.

Among rare hardy plants in flower now is Camassia esculenta alba. This is furnished with linear leaves from one to two feet long, and deeply grooved; it bears a loose raceme of large star-shaped flowers, each segment being oblong, a quarter of an inch broad, and about one inch to one inch and a-half long, and of the purest white. C. esculenta lactea or C. e. Leichtlini is another very stout-growing form, with leaves from two to two and a-half feet long, and of a light glaucous green, and racemes of large creamy white flowers. C. e. rosea differs in habit little from C. alba, but the flowers are of pretty pink or violet-rose hue; this originated here at the Hale Farm Nurseries in a batch of seedlings, and flowered for the first time this year. Camassias are so very hardy that I have never seen them injured by frost; they can be successfully grown in any garden, and will flower during May and June.

Tulipa linifolia is one of the prettiest of tulips, its linear leaves being slightly undulated, and setting off one small crimson flower that is produced on a scape about six inches high. It flowers in May and June, and is a very rare plant. Tulipa Batalini is, as far as habit is concerned, almost identical with T. linifolia, but the leaves are more glaucous, and the flower is pale yellow; it is also a very rare plant, and flowers in May and June. Both species are quite hardy and easily grown, but evidently not easily increased, which would account for their scarcity. Tulipa Sprengeri is one of the most charming of tulip species I know. It grows and flowers so late, being only now in bloom (June), that no frost would ever hurt it. The leaves are linear, about a foot long; scape about a foot high; flowers deep crimson, the exterior segments being tinged with buff. Although comparatively new it is fairly plentiful now, and should therefore be in every collection of hardy plants.

Eremurus robustus var. Elwesianus has a semi-tuberous root, and stout leaves from two to three feet long by two inches broad, light green and glabrous, often ciliated. The naked scape is from four to eight feet high, bearing a raceme three to six feet long of very showy flowers which are star-shaped, bright pink, rosy salmon or peach coloured, and sweetly scented. This differs from the type in its broader and longer leaves, larger flowers, and by being also a month earlier to bloom. This variety is less easily propagated than the type, not being a free seed bearer, and seedlings usually becoming six years old before flowering. The cut raceme so well shown by Mr. Ware, of Tottenham, at the recent Temple Show, was from a plant twelve years old that has only now reached perfection. This fine form should be planted in a sheltered corner, near a shrubbery, but in a fairly sunny position, and the soil should be well drained, no matter what its composition. A bed of Eremuri in flower is a fine sight, with plenty of long column-like racemes and bright or glaucous green leaves. Owing to late frosts, only few are this year in perfection and I have seldom seen more miserable racemes of E. himalascus, the white flowered eremurus. Nor are E. robustus and var. Elwesianus up to the mark. The kinds worth growing are E. robustus and var. Elwesianus, E. himalaicus, E. Olgæ, E. Bungei, E. persicus, and E. Aitchinsoni; most of the other species are of less value than the common asphodel.

After cultivation and trial during several years Incarvillea Delavayi has proved to be perfectly hardy and of the easiest culture. The plant is deciduous, with a strong fleshy root; the leaves appear during April and May, and attain in a strong well developed specimen to a length of from two to three feet, resembling somewhat those of Acanthus; they are pinnate, of a light glaucous green, dentate or serrate, the petiole being somewhat scabrous, and at times hirsute. The foliage is very ornamental, and on this account alone the plant would be worth growing. The scape rises well above the foliage and bears a terminal raceme of several flowers of a bright rose, rosy purple, or rosy violet colour, with orange yellow tints. The tube of the flower is about two inches long and the corolla about one to one and a quarter inches across. Those who have seen or possess a good specimen, will admit that this is one of the most strangely beautiful hardy plants ever introduced. In April, when the somewhat late foliage appears, it is of a deep purple, the petioles tinged a deeper hue, but assuming latter on a better colouring, and what appears to be at first a kind of Acanthus with ornamental foliage turns out to be one of the most showy of hardy plants. The finest specimen I have had the pleasure of seeing was in the garden of Monsieur Micheli at the Château du Crest, near Geneva, growing side by side with the beautiful and rare campanula Ostrowskia magnifica, a specimen about three to four feet in height and at least five feet across. Fortunately plants can be as well grown in the less favourable climate of London, and there are now several specimens blooming at Tottenham, one of which ripened seeds last year.

There are two varieties of this incarvillea, one, the Museum variety of the City of Paris, from whence it was distributed, having been at first collected by the Abbé Delavay; the other is the ordinary form, differing little except in time of flowering. The best time for planting is the autumn.

G. Reuthe.

Outdoor Tomatos.—The season so far has not been a very favourable one for these tender fruits. Plants have grown very well, but they are very late, probably a couple or even three weeks, and that is a long time in the short lives of tomatos outdoors. I have during the past few weeks seen in Surrey literally hundreds of cottage gardens and allotments, and have observed with pleasure in some, with pain in others, the efforts made to grow tomato fruit. Where the pleasure was found was in those gardens or allotments where some special effort had been made to give the plants shelter. Thus in the gardens warm walls or fences would be utilised, and in both gardens and allotments in several cases lengths of corrugated iron were secured by means of stout stakes as a background for the plants, with very admirable results. The pain was found where the plants were put out tied roughly to sticks, hardly pinched, and left very much to their own courses with a very poor fruit prospect.—A. D.

GARDENING REMINISCENCES.

As briefly as I can I will record some of my experience in connection with my calling as a gardener, which extends now as far back as the year 1848. It will be readily understood that during the half-century which has elapsed I have seen many changes. One of the most striking is the improvement of the education of the gardener; another is in the opportunities young men now have of pushing on their education after they have left school. The first gardener I was under could neither read or write; nor was the steward on the same estate nor the butler indoors much of scholars, yet everything went on smoothly. The proprietor was, what we should say now, one of the old-fashioned gentlemen, and I imagine that head gardeners of the present day would open their eyes if the owner came and addressed him as Jack or Joe, as the case may be. That, however, was the rule at the time of which I am writing. Many a time has the proprietor come and asked me where Will (referring to the gardener) could be found. Every upper servant on the estate was addressed in the same familiar way by members of the family. The steward was always called by them in his Christian name as George, and the butler Daniel. All the upper servants and many of the others had grown old in the family, and those who were past work retired on a comfortable pension. In many cases all this is changed now.

Referring more particularly to the management of the garden half-a-century ago, I must mention that the gardener had particular days in the year for sowing and planting his important crops. The first sowing of peas was always made on Lord Mayor's Day, and Ashleaf potatos were planted on south borders on the 20th of the same month, and they were always dug in, *i.e.*, planted six inches deep in the trenches, as the digging proceeded. Tomatos were grown at that time on open walls and not under glass. I well remember they fruited as well then as now, but not a tenth part of the fruit was ever used. I have thrown many a large basketful of fine ripe fruit on the rubbish heap. With regard to fruit trees, I have lived to see a wonderful improvement in the pruning of peach trees. The gardener under whom I served so severely pruned all kinds of trees, and peaches particularly, that it would take him ten years to cover a wall twelve feet high. At the time of planting every shoot was cut back to within six inches of the base, and nearly as much the next, and this was the practice followed generally. I may also mention that at that time cast-iron wall nails were not invented; the nails were made of wrought iron, and many a half-day in bad weather have I spent in straightening out nails, as they all had to be used the second time, and sometimes more.

The only way of growing cucumbers and melons was in frames placed on hotbeds, and the usual time for cutting fruit of the first mentioned was the middle of March, and the middle of June for melons. If there is one thing fixed in my mind more than another it is the turning out in early morning to keep the lawns in order by the use of scythes, lawn mowers were unknown, and for a good part of the summer all hands had to rise at four o'clock in the morning to mow the grass cut before the dew dried up. Many a time in early spring and autumn have my fingers been so cold that I could hardly hold the scythe, while with a knife I have scraped the ice off the blade before it could be sharpened. So rigid was the rules, that nothing less than a heavy downpour of rain, or a snowstorm, was accepted as an excuse on the days appointed for the lawns to be mown. It must be remembered that we were not paid a farthing, or received any other kind of consideration, for rising so early in the morning. The ordinary work was carried on until six p.m. just as if we only started at six o'clock in the morning. One day's holiday in three years was all the relaxation I had in that situation, and one Sunday out of two off duty.

Comparatively few bedding plants were then grown, but there was no scarcity of flowers notwithstanding. There used to be separate beds of choice pinks, carnations, alpine auriculas, tulips, ranunculus, &c. Dahlias were as well grown then as now, the only difference being, so far as I can see, in the dwarfer growth of the plants. There has been a marked improvement in the form and size of hyacinth flowers since then, as at that time they were grown with greater care than they are now. Pots were specially made for them, about five inches in diameter, and considerably deeper than the ordinary pot. The same form of pot is known as Long Toms at the present day. Speaking of pots reminds me that new ones were always used for the pineapple plants when they were large enough to be placed in the pots in which they were to fruit. I must return to the hyacinths, because I omitted to say they were potted in sand, no description of soil whatever being used, and I well remember what a lot of water they required in bright weather in March. Considerable numbers of cacti were also cultivated. Some of the forms made a brilliant display, while it was quite an event to sit up half the night to see the first flower open on what is known as the night-flowering cactus. Much larger numbers of annual flowers were used in the beds and borders than is the case now, and every gardener was expected to save the seed he required, and he was very often glad to exchange with a gardener several miles distant of any sorts of which he may not have been successful in saving seed. Let the reader just fancy what would be thought of a present day gardener if he sent a man, as I have been sent, several miles to beg or exchange a bit of seed of Venus's Looking-glass or candytuft. To appreciate the difference we must understand that it was not because the owners of gardens objected to purchase the seed, but because the same facilities did not exist for obtaining it then as now. The postal authorities had not thought it worth their while to trouble about distributing seeds, and very few seedsmen printed catalogues to let their customers know they had them for sale. Now all flower seeds can be obtained through the post at a cheap rate. My young friends will admit that this is a change for the better; at any rate, it will show them that their opportunities for learning and improvement are vastly greater than was the case fifty years ago.

It must, of course, be remembered that if the ordinary boy received his education at a National School that was all he could expect. Things are very different now, for, with continuation schools and technical education classes, education has been brought within the reach of all. In the early part of my career there was a greater number of Scotch gardeners holding positions in this country than there is now, and, although an Englishman myself, I am bound to say that as a young learner I received nothing but kindness from my Scotch masters; as a matter of fact, they took a greater interest in their young men than did some of our own countrymen; and, looking back after so many years, it is agreeable to be able to say that in my many visits to different gardens which have been described in past volumes of the Gardeners' Magazine, the same kindly feelings have been sustained. I can call to mind many hours of pleasant intercourse that has proved both instructive and agreeable. I was asked by a young friend not long ago, if the position of a head-gardener had improved during my time, and I unhesitatingly answered "no, not financially or socially." In only a few instances has the salary increased in proportion to the responsibilities, which have increased in very many cases to a far greater extent than many [illegible]. I have incidently referred to the increase of opportunities young gardeners have at the present time of improving themselves; at the time of which I am writing there was no Gardeners' Magazine to interest and instruct one. They will hardly realise my feelings, however, when I first saw it announced that a weekly gardening paper was about to be published at twopence per week. I quickly gave the order to have a weekly copy. To my regret, the fourth week was a double number, for which fourpence was charged. This was a damper to a young fellow with small means, but I continued to subscribe to it, although I was not sorry when the double number died a natural death, which it did at the end of a few months.

My next change was to a district where good gardens were not so far apart, and in which a gardeners' mutual improvement society had already been formed, but to which no under-gardeners were admitted. This I and several other young men felt to be unfair, so we drew up a statement of what we considered our wrongs, and laid it before the committee of management, with the result that the rule was relaxed and we were admitted to all the privileges of the society on the same terms, which was 6d. per month; the meetings being held during the winter months on the Thursday evening next before the full moon. This arrangement was for the purpose of making it more pleasant for members to have the benefit of the moonlight to go to and from the meetings. With the money so subscribed a good stock of gardening books was provided, and one or two monthlies. The latter each member was allowed to keep three days, and then to hand it over to another. This, in some cases, meant a walk of two or three miles. I well remember with what avidity I devoured the contents of all Loudon's works, especially that on trees and shrubs. "Paxton's Botanical Dictionary" was published about that time, and my delight was great when it came to my turn to be its possessor for a month. Young men at that time had a good deal of opposition to contend with. The older men in the garden regarded books or papers as useless aids to gardening, as many of them could neither read nor write; yet to show the capacity and retentive memory of some such men, I would mention that I worked for two years with one who had acted as parish clerk for many years, yet he could not read or write his own name. At the beginning his wife read out to him the Church Service, and that was all the tuition he had, yet I never knew him to make a mistake.

T. C. Clarke.

THE AMERICAN BLIGHT.

Many good receipes for clearing apple trees of the American blight have been given from time to time by cultivators. These consist of quicklime, sulphur, lamp-black, soap, and paraffin. I venture, however, to recommend at this season, when the blight is prevalent, a swifter and more sure means of cure, which I mainly relied on for many years. This consists of a hard scrubbing brush and a hot lime or other wash. The American blight has many faults, but from the cultivator's point of view as a pest to be destroyed it has one special virtue—it is soft, flimsy, and easily squashed. Hence, though I recommend a hard brush for reaching the nasty blight in the deepest crevices of the wood or bark, the slightest touch of the brush suffices to kill this virulent pest. Some even contend that it is not needful to crush nor bruise the insect in order to cripple or destroy it; the mere displacement of its filamentaceous embellishments checks its power of mischief, should it not end its life. Be that, however, as it may, a very slight pressure under a hard brush makes a speedy end to its mischievous life. Until the fall of the leaf the difficulties of reaching all the blight with the brush are well-nigh insurmountable; but with the fall of the leaf comes free access to the insects, singly or in masses. To facilitate this the more readily crowded spurs or branches may be then thinned, the brush alone, if diligently and skilfully used, soon making an end of the blight after a few operations. To make security doubly sure a wash of caustic lime-water should be scrubbed into every nook and cranny of the tree. This kills or cripples the stragglers, or forces them to retire. Some add to the pungency of the lime or other washes with soap, sulphur, paraffin, methylated spirits, &c. But these are more costly, and hardly more efficient than the hard brush and caustic lime wash.

Not a few fail to destroy American blight, through failure to clean the roots, as well as to scrub or paint the branches, and yet perhaps the most fertile breeding ground for this pest is found in the border land around the boles of the trees, and in its larger, more knotted, and gnarled roots. It is of little use cleaning the tops of the trees while the roots are covered and blighted with vermin. Of course the boles on the main roots must be cleared before the scrubbing brush or the lime wash can be brought to bear on the blight. But for the encouragement of growers it may be stated that the underground blight is, if possible, more readily destroyed than that on the tops of apple trees. But the point of most moment is that the pest on the roots must be destroyed if the trees are to be cleaned. A hot bath of soapsuds or sewage, at a temperature of 130 Fahr., rubbed into the clusters has in many cases hastened the process of cleaning. Grease bands round the boles an inch or two under the surface soil have also formed distasteful barriers to the passage of blight. A more potent dry barrier consists of placing a handful or two of dry soot and caustic lime round the stems. A few may pass through, but the majority are pickled.

But my reliance is on the scrubbing brush and the whitewash, and their persistent use until neither white speck or thread appears. These will disappear all the sooner if every grower would carry a small phial of methylated spirits, or alcohol, which is equally effectual, but much dearer, in his pocket, with a small camel hair pencil. The moment a speck or thread of blight appears, very lightly moisten the brush in the spirit and touch the insect. Death is instantaneous, and if the process is done skilfully, not a leaf, twig, or fruit need be injured, while not an insect touched will escape.

D. T. Fish.

Dry Weather and the Fruit Crops.—The simplest answer I can give to "Lea," is that the rainfall for the months of March, April, and May of the present year was nearly half an inch less than for the corresponding period of last year, and if the two preceding months of January and February be included in each case, the deficiency nearly reaches to four inches less this year. Added to this, ocular demonstration stands for something. When we find ponds, wells, &c., dried up that have not been in this condition for many years, we are certain that the soil is in a much drier condition than usual, and I am sure in our case fruit trees, where not watered artificially, have suffered from the continued drought.—South

"SWEET LAVENDER."

At the first blush, so to speak—though surely such a precise plant as the lavender never had any need to blush—it would, observes a writer in the *Globe*, seem that this delicate little herb of fragrance must, beyond all question, be a native of our soil. Its habits are so simple and unobtrusive, and its uses so homely and pervading, that it is difficult to think of the sober-tinted bush as originally a foreigner. Some exotics never look naturalised; while the lavender seems never to have been an exotic. A certain shrinking modesty hangs about it which makes it the very paragon of domestic life. For one thing, lavender is obviously of too Quakerish a habit to flaunt it with its gaudier floral sisters in the competition for public favour. Whoever encountered the pretty puritan at a flower show? Its very hue is suggestive of everything that is humble and retiring, while its form is slight, and by no means beautiful. But then the violet has lost its lovely odour in the course of its development into the pansy. And it is not an unpleasant reflection, in these days of advanced floriculture, to know that there remains at least one modest garden blossom which has not had "greatness thrust upon it."

In the time of Queen Elizabeth, some half-dozen varieties of the lavender plant were to be found in our better-cultivated gardens. Shakespeare speaks familiarly of it, though it was scarcely known in England before the sixteenth century. It is doubtful to whom we specifically owe its introduction; but, at all events, the lavender speedily made itself at home with us, and throve equally in the affections of the country folk who favoured it. In a few years it had entered into the very heart of our purely domestic observances. The lady of the manor and the "mother" of the hamlet set equal store upon it. It yielded washes, scents, ointments, and medicine. At a later period it was used to mitigate the austere contents of the snuff-box; while a drop of its essential oil was regarded as "sovereign for the vapours." A herb possessing so many merits was naturally welcomed on all sides. It was so exquisitely clean, fragrant, and refreshing that it took all the housewives' chests and store-closets by storm. Izaak Walton completes his picture of an ideal chamber in a rustic inn by the recommendation of "lavender in the windows," while his pupil "Venator" is attracted to the same house by the fact that "the linen looks white and smells of lavender." The phrase, "laid up in lavender," is emphatic of the prevalence of this wholesome and delightful custom. And, in many of our country districts, lavender for the linen presses of a house is still deemed quite as necessary as honeysuckle for the adornment of its porch.

The lavender is indigenous to several countries of Northern Africa and Central Asia, and is thought by some learned commentators to have entered into the composition of the famous "spikenard" ointment of the East. It was much used by the ancients for scenting the waters of their manifold baths, and the Latin derivation of the word is sufficiently obvious. Our term "lavender water" may thus be a survival; for though in English practice the essential oil of the plant is obtained by distillation with water, its perfume is afterwards imparted to highly rectified spirit. Our country custom of making lavender bags and placing the dried flowers among linen is also derived from antiquity. There are records of this practice older than the discovery of distillation, and it says much for the natural efficacy of the lavender that its homely virtues are to this day so highly prized. To breathe the fragrance of the sad-coloured spears after the penetrating perfumes in which our ancestors delighted, must have been as delightful as the savour of sea air. And yet the lines long continued to be true which thus apostrophised the over-scented fop of the period:

"Bring, oh bring, thy essence pot,
Amber, musk, and bergamot;
Eau de chipre, eau de luce,
Sanspereil, and citron juice."

There must be something in the English soil and climate peculiarly acceptable to the habits of this plant, for it attains here to a perfection unequalled by the growths of most other countries. No doubt an immense impetus was originally given to its cultivation by the practice of home distillation. At all events, the fame of our English lavender-water is world-wide, a fact generally admitted by foreign perfumers themselves. Of course, the industry is a most important one in the South of France, where the lavender harvest enlists a large part of the peasant population. The operations attending it are simple, but not devoid of interest. As among ourselves, the flowers are reaped with a kind of sickle, and being tied into bundles, are at once conveyed to the adjacent distillery. But the French manufacturer insists on putting both stalks and leaves into his still, and on adding to its product some other kinds of essential oil, and various coarser compounds. Preferring quality to quantity, our own leading makers confine their operations to the blossom itself, with a result best appreciated by those who have once compared the home and foreign forms of the perfume. The distinctly refreshing nature of the best home-made scent is in strong contrast with the heavy, clinging quality of that which comes from abroad. Upon the whole, good English lavender-water is the perfume most generally acceptable in a sick chamber. It is refreshing long after other essences have palled; and thus, to the end, the lavender holds its own in its unpretentious and almost prosaic way.

No doubt the famous "attar" of the rose of Cashmere still ranks as the highest ideal of the perfumer's fastidious art. But there is a simplicity, almost as grateful as its fragrance, about our old-fashioned English lavender-water which endears it to many. The modern builder has seriously encroached upon the once famous lavender fields of Surrey and Middlesex, but Mitcham lavender has still a reputation which commands for it the highest prices in the market. But, as in other and more important commodities, Greater Britain is quickly coming into the competition. For some time past the settlers of South Australia have been annoyed by a "nuisance" in the form of a persistent plant which their cattle refused to eat. It proved to be lavender, with which a considerable area has since been planted. And now Australia is distilling her own lavender-water, which, let us hope, may not be very inferior to that produced by the mother country.

NEW INVENTION.

Celluloid Auto-Labels.—These labels are small strips of celluloid, with one end treated and curled so as to form a spring-like clip, and thus enable the label to be affixed to stem or stake without tying. The patentees claim for their invention that it requires no tying; is always white and clean; uninjured by heat, damp, or time; clip expands with growth of stalk; and it can be fixed in a second with one hand. No preparation is needed, a soft black leadpencil only being required for writing. The label, when fixed, stands out horizontally from the stalk. We are in doubt as to how the action of water would affect the writing, and fear the legibility would not long remain if the label were used out of doors, as writing both by pen and pencil appears to be readily washed off; then also while the clip end will expand it cannot readily be contracted to fit a more slender stem. The labels are to be obtained from Allport's Patents, 108, Queen Victoria Street, E.C.

Work for the Week.

WARM ORCHIDS.

We are at the present time experiencing some peculiar weather, very heavy rains following spells of hot sunshine; such experiences are rather trying to orchid growers, in certain departments, with respect to shading and airing. Lælia purpurata is a commonly grown orchid, and very often at this season too much water is afforded at the roots; if an overdose is given it is very likely to rot the pseudo-bulbs. Lælia crispa, in most collections, will now be making a fair display, and only sufficient water must be allowed to keep the bulbs in a plump condition, at the same time removing the plants to a drier atmosphere, otherwise the damp will condense on the flowers and cause small spots to appear, leaving the blooms useless in every way. Some of the cattleyas will be growing, others flowering, and some resting; it would be well to remove all that are growing to the warmest end of the house if a separate structure is not at hand for them. Cattleya Gaskelliana that has finished flowering ought to be put at the cool end with other occupants of the same condition. The roller blinds on the cattleya house ought to be pulled up a little earlier in the afternoon now in order to gradually ripen up and harden the pseudo bulbs before the winter months; plenty of fresh air, both at top and bottom, must be given on all favourable occasions, and if this is done in conjunction with extra light the results will be satisfactory. Many amateurs are in the habit of using the hose-pipe indiscriminately over and among all their plants and whatever section they belong to; this plan is good so far as economising labour goes, but absurd for growing successfully the old-established plants. It is certainly good to damp well in between the pots, and all about the house, under the stages, &c., to obtain a growing atmosphere, but not to drench the plants with cold water every morning whether they require it or not. The plants may not show immediate ill-effects, but will ultimately do so.

Thunias must now be removed to a cooler and drier atmosphere, and be placed close to the glass, in order to well ripen the growths; a shelf in the vinery is a suitable place for them. The ends of the leaves, as they die off, may be cut away to prevent an unsightly appearance. Cypripedium bellatulum and C. niveum may now be repotted if they require it. These are difficult plants to grow successfully year by year, as they require to be treated much the same as succulents; their foliage is very largely composed of water, and if overfed, the plants cannot breathe freely. The best compost to use is loam, limestone broken up small, and a little peat, well mixed together; the pots or pans must be well crocked, in order to have good drainage at all times. If convenient, a shelf will be found a suitable place for them. The temperature in the houses will be difficult to regulate, owing to the fluctuations of outside conditions, but it is not necessary to be exact at this season.—Thomas Stafford, *Tyntesfield Gardens.*

THE FLOWER GARDEN.

Speaking generally, the flower garden should now be at its best for the present season, for although continued dry weather has somewhat checked the growth of some subjects where the application of water was not practicable, the extra warmth has, however, produced a wealth of bloom on most flowering plants. The present will, therefore, be a suitable time for noting any alterations or improvements it may be desirable to carry out another year, that propagation may be proceeded with accordingly. As soon as this has been determined a start in propagation should be made forthwith with pelargoniums and such like, cutting over the beds carefully, as thinning now will be to the advantage of the plants, and the cuttings not being over sappy should strike freely. These may be inserted in any open border and potted up into small pots in the autumn, or placed direct into store pots or boxes filled with sandy loam, with the addition of a little leaf-soil, and stood in any open, sunny position. The latter is the more usual practice, and if boxes of one size, and not too large, are used, the more convenient they will be found for storing through the winter. The tender varieties, such as tricolors and variegated kinds generally, should be inserted first, which will allow them to become well established early, and thus pass the more safely through the winter months. These should also be struck principally in pots, and if pits are at liberty they may be stood in them, and in the event of wet weather occuring the lights can be placed in position, allowing plenty of air.

Wallflowers raised from seed recently should be ready for pricking off from the seed bed into nursery quarters at six or eight inches apart each way. A thorough soaking of water should be given to settle the soil about the roots. The preparation of plants to furnish the beds for spring flowering should be carried on in earnest now. Old plants of myosotis should be pulled to pieces and dibbled in about six inches apart each way; whether with or without roots, they soon make nice plants if watered occasionally if dry, and will be ready for going out in early autumn. Seedlings should also be pricked off the same distance apart. Pansies and violas should be well supplied with water while the weather remains dry; if a shaded border can be found for them, or cooler weather with rain set in, they may now be pulled in pieces, selecting all the young growths to be dibbled in, in nursery rows six inches asunder, and kept watered as often as the state of the weather necessitates. Other subjects may be similarly treated, including Alyssum saxatile, aubrietias, arabis, daisies, primroses, and polyanthuses. For the same purpose seeds may be sown of such annuals as Nemophila insignis, Saponaria calabrica, silenes in variety, Limnanthes Douglasi, Collinsia bicolor, and godetias. Intermediate and Brompton stocks, if not already in, should be sown forthwith in shallow drills, moistened to ensure a quick germination. These may be potted up later on, and kept in frames through the winter and planted out in spring.

The present is a suitable time for giving new and similar hedges their annual clipping. If cut now after the principal growth is made, they require little further attention during the year.—C. Herrin, *Dropmore Gardens.*

STOVE PLANTS.

The season is now advancing, and the object of the cultivator should be to mature the growths of plants in the stove, so that they may stand our long, dull winters without injury. With this end in view do not force growth now, but admit rather more air—of course, using judgment and care—the aim being to have the shoots of the present season hardened, so that they may pass through the winter without becoming naked through the loss of leaves. How often does one see, in going through the stove in early spring, crotons and other things that are skeletons through the loss of leaves during the winter; this is frequently attributable to encouraging a free growth late in the autumn months, which does not become matured. Then if a long, severe spell of hard weather occurs, with perhaps weeks of dull, leaden sky, the leaves are shed at an alarming rate, the result being unsightly plants, and a severe check to those subjects' future progress. When I say admit air more freely, I do not mean to open the ventilators wide early in the day all at once; but, commencing early in the day, gradually increase the amount until the maximum is reached; in the afternoon follow the same process in gradually reducing up to the time of closing the house and affording the afternoon syringing. It will be necessary still to keep the atmosphere moist by damping floors and stages, yet not to the extent carried on during the hotter and longer days of summer. Pancratiums that have just flowered will be throwing up their new leaves, and any needing repotting should be attended to at once; any other things requiring repotting attend to directly. Every week now the days are getting shorter, and greater reliance will have to be placed upon the heating apparatus, under which conditions the water-pot has to be called into requisition more frequently for newly-potted plants than is good for them.

Gloxinias that have stood in the conservatory for the flowering season, and are now over, should be transferred to the stove; afford water and stimulants so long as the foliage keeps fresh; when showing signs of ripening gradually withhold water until, when the leaves and shoots are fully matured, it may be withheld altogether, and the pots laid on their sides in the bed of the stove for the winter. Seedling plants of gloxinias established in four and a-half and five-inch pots and showing their flowers should be encouraged by means of application of some good artificial fertilizer. The plants of gloxinias raised from leaves this season encourage to grow as long as possible to obtain large tubers for next season's flowering. Gesnerias for late autumn decorations that are established in their flowering pots must be afforded stimulants; later batches pot on as ready. Plants of stephanotis and allamanda that have finished growth and flowering may be removed to a cooler house to rest; still afford water, but in reduced quantities. Saintpaulia ionantha is now flowering, and will be best placed in the intermediate house. Rogeria gratissima is now flowering in the latter house, and is well worthy of extended cultivation, its pinkish cymes of flowers are more appreciated by many people than are bouvardias. As plants of dipladineas have finished flowering, remove them to a cooler house and expose them to full sunshine to ripen the shoots. Afford stimulants regularly to plants of Clerodendron fallax that are flowering or approaching that stage.

Wage a constant war upon all insect pests—in ratio to the way these flourish the plants infested suffer. If all the plants in the stove are examined at short intervals it is not a great matter to keep them clean. Less shading will be necessary now, yet care must be taken that scorching does not occur. Put in a few cuttings occasionally of such things as coleus, acalyphas, fittonias, crotons, and other things to replace any that have suffered through being used for furnishing in the house. Keep an eye on ferns, to remove all decaying fronds; good specimens may soon be spoiled by neglect of this. Gomphrenas are now well in flower, and may with advantage be removed to the conservatory; yet they will not stand cold draughts, if exposed to such they will in a few days become very shabby subjects.—J. Tunnington, *Ripley Castle Gardens, York.*

HARDY FRUITS.

The genial rain that has fallen in most parts of the country was much needed, but owing to the parched condition of the soil it was soon used up, and did not reach the deeper roots, so that it will be necessary to mulch and give moisture on light soil to newly-planted trees or those bearing a heavy crop. The apricots should receive copious supplies of water after the fruits are cleared, as it is important to build up a strong growth; trees that make little wood are the first to fail. Peaches and nectarines as soon as cleared of fruits may have a goodly portion of the old fruiting wood cut out. This does not always add to the appearance of the trees, but the wood needed for next season's fruit is well matured, and rarely suffers in the worst of winters. By removal of fruiting wood, I mean the wood that has just borne the crop, and, of course, with peaches and nectarines this is small wood of last year's growth. Such will not fruit again, so it is not needed, and must give place to the wood of the current year. With young trees that are inclined to make gross growth, and that have borne little fruit, more attention must be paid to the leaders; these should not be crowded. Foreright shoots should be cut clean away, and the side ones tacked in to extend the trees. There is no need to use the knife severely with young trees, as if given plenty of room to extend it is much better to cover the space in a short time. Few trees more liberally respond to good culture, and seeing how quickly a maiden tree can be grown into a fruiting condition, my advice is to encourage good wood, give it ample space to mature, and merely remove useless growths. Many growers will consider by this method there will be gross wood, and in some cases there may be, but it can be remedied by lifting in the early autumn just as the leaves are commencing to turn colour, and if there is care exercised there will be no loss of fruit, and the trees make splendid fruiting wood the next few seasons. At this season any unsatisfactory trees should be marked for removal, for though it is hard to part with old favourites, there is no gain in keeping worn-out trees of any kind.

Newly-planted strawberries will need water freely to enable them to root into the soil, and the plants will benefit greatly if the water is given overhead as the sun declines. I find that growth will be much stronger if treated thus, as the plants delight in the cool night moisture, while in soil of a thin nature it prevents the plants becoming a prey to red spider. Old beds just cleared of fruits and to be retained for a future crop should now have all runner growths cut close away unless runners have been layered and pegged in the soil for new beds. These in most cases will now be ready, and should be removed, for if placed under a north wall or in a cool place it is not necessary to keep them attached to the parent plant until they have filled their pots with roots; water is also more readily given, and the old quarters can be cleared up. I am not an advocate of mowing over the old foliage, as is sometimes done. Useless leaf-growth may be cut away and the plant may with advantage be given food now. I advise liquid manure if it can be spared and the labour to apply it; failing this, a good dressing of a good fertilizer hoed in will assist in building up strong crowns for next season's fruiting. Many persons like the small alpine strawberry; these are readily raised from seed sown in the spring, and will give a good return the following year. Space does not permit to enter at length into their culture, but I believe seedlings may now be secured from leading growers for autumn planting at a small cost, and the fruits of the large red and white are delicious for late supplies. Strawberries that were forced in the spring and then planted out for a late crop should have their flower trusses thinned and receive ample supplies of food and moisture. Now is a good time to lightly thin the wood of gooseberries that touch the soil; for many of our best gooseberries are low growers and inclined to make their growth too close to the soil. Early apples such as Lady Sudeley, Mr. Gladstone, and other kinds are maturing much earlier than usual with us, and it will be advisable to examine the trees every other day and clear fruits just ready, for the flavour of these early kinds is not improved if the fruits are left to mature on the trees. The same remark applies to early pears, as Jargonelle and Williams' Bon Chretien; the first named, on walls, matures very early, and if stored for a few days its flavour improves, but a cool store is desirable, and the fruits must be placed thinly, care being taken in gathering.—G. Wythes, *Syon Gardens.*

EXHIBITIONS AND MEETINGS.

NATIONAL CO-OPERATIVE FLOWER SHOW.

THE thirteenth annual flower show in connection with the Co-operative festival was held on Friday and Saturday, August 19 and 20. The whole of the centre of the Crystal Palace was devoted to the tremendous display, which consisted of about 5,000 exhibits from all parts of the country. In the open or professional gardeners' classes there were 455 entries for vegetables, 407 for cut flowers, 166 for pot plants, and a few other exhibits.

In the industrial or working men's section there was a display that can only be described as marvellous when one considers the short time at the disposal of many exhibitors and the lack of glass many must experience for the furthering of their favourites, which in many instances require artificial warmth in their earlier stages. As regards this section there was again a notable increase in the extent and variety of the exhibits. These exceed the entries of professional growers by four to one, and embrace every kind of vegetable garden produce. The contrast in respect of variety of exhibits is remarkable between the present show and the earlier ones of ten to twelve years ago, when potatos, cabbages, and a few other leading vegetables represented all the kinds shown by workmen. This year in the industrial section potatos certainly led with entries of 239 dishes, but there were also 146 entries of different kinds of beans, 107 entries of vegetable marrows, 86 of onions, 83 of garden turnips, 79 of peas, 79 also of beet, 60 of shallots, 56 of garden carrots, 53 of lettuces, 38 of parsley, 35 of celery, 31 of cabbages, 24 of cauliflowers, 15 of radishes, and 11 of leeks. It is remarkable that there were no less than 43 entries of cucumbers in this section and 28 of tomatos.

In flowers also the workmen's section showed wonderful development. There were 27 baskets and collections of roses, eight baskets and 37 collections or bouquets of annuals, 10 entries of table decorations, 63 bouquets, vases, and epergnes by the wives and daughters of members, and 44 by their children. The separate exhibits of cut flowers from workmen's gardens numbered 504, and comprised carnations, chrysanthemums, dahlias, everlasting flowers, Indian pinks, mignonette, pansies, petunias, phloxes, sweet peas, antirrhinums, asters, stocks, salpiglossis, marigolds, zinnias, liliums, and gladioli. Pot plants shown by working people numbered 257 entries, and included not only all kinds of annuals which can conveniently be grown as window plants, but begonias, Lilium auratum, pelargoniums, fuchsias, petunias, and many others. The workmen's fruit entries numbered 159. They included apples both for cooking and dessert, cherries, currants, gooseberries, pears, plums, and varieties of other open-air fruit. It is notable, also, that there were four entries by working people of bunches of grapes.

Five collections of six varieties of fruit were staged in the professional class. Mr. C. J. Waite, gardener to Sir P. Talbot, Esher, won first prize with black and white grapes, peaches, apricots, nectarines, and a melon, nothing whatever being [illegible], an omission one does not expect from so old an exhibitor; Mr. Osman second. For a collection of five dishes of fruit grown in the open air Mr. Osman scored with Golden Gage plums, Hales Early peaches, Brown Turkey figs, Moor Park apricots, and Elruge nectarines; Mr. R. Chamberlain second. Mr. Wadham showed the best apricots, and Mr. Chapman the best Morello cherries. Currants and goosebeerries were plentiful and good, Mr. Bugby, Desborough, being a successful competitor.

Mr. Osman's pair of bunches of Black Hamburg grapes gained a first prize; Mr. W. Taylor, gardener to H. C. Bayer, Esq., Forest Hill, coming second; and Mr. Waite, third. Mr. Tayler scored for white grapes showing good Muscat of Alexandria; Mr. Osman second with Buckland Sweetwater; Mr. Waite third. Mr. G. Cheal, gardener to Sir W. Farquahar, Bart, Dorking, staged the finest nectarines, and Mr. Chapman the best dish of peaches. Mr. Waite led for pears, Mr. Tayler for cooking plums, Mr. Waite for dessert plums, and Mr. Tunbridge for a melon.

Mr. S. Chapman, gardener to Sir E. Walter, K.C.B., showed the best three dishes of apples, Peasgood's Nonsuch, Bramley's Seedling, and Lady Henniker; Mr. E. Merton, second, out of fifteen sets. Eleven competitors staged three dishes of dessert apples, Mr. R. Fellon, St. Mary Cray, leading with brightly-coloured Red Juneating, Devonshire Quarrenden, and Mr. Gladstone; Mr. Woodham, second.

There were seven competitors in the class for a collection of vegetables, com[illegible] open to the Southern district, comprising Essex, Herts, Bucks, Oxford, Berks, Wilts, Hants, Middlesex, Kent, Surrey, Beds, and Isle of Wight. The first [illegible] set was shown by Mr. C. J. White, gardener to Sir P. Talbot, Esher, who had remarkably fine dishes of Satisfaction potatos, Best of All runner beans, Ailsa Craig onions, Solid White celery, Perfection tomatos, Intermediate carrots, Autumn Giant cauliflowers, Blood-red beet, Autocrat peas, and Lyons leeks. Mr. J. Holton, a famous Oxford vegetable grower, secured second place; with Mr. R. Wadham, South Aston, third; and Mr. J. Dann, St. Mary Cray, fourth. There was but one competitor from the Midland district, Mr. J. Nowell, who gained a well-deserved first prize.

Runner beans were splendidly shown, Mr. Holton scoring a first for Giant Scarlet, and also in the class for any variety, showing straight even pods of Champion; Mr. Wadham was second in both cases. Mr. W. Emerton, of Buckingham, led for French beans, out of fourteen competitors. Mr. A. Tunbridge, gardener to the Rev. W. Trimmer, Chelmsford, had the finest Longpod broad beans, while Mr. Emerton showed tho best dish of broad Windsor. For long red beets, Mr. Emerton was again successful, but Mr. Waite led the way for round beets. Carrots were splendid for the season, Mr. Holton leading for Inter[illegible], and Mr. Emerton for Long Surrey; these two classes brought two dozen exhibits. Mr. Waite led for cauliflowers, with lovely specimens of Early Dwarf. Mr. Holton showed the best red celery, and Mr. O. Basile, gardener to the Rev. O. S. Powell, Wexbridge, had the best white. Mr. Wadham scored for cucumbers with a brace of Improved Telegraph, and Mr. Holton for leeks. Onions were plentiful, Mr. Emerton winning for spring-sown produce; Mr. R. Chamberlain, gardener to F. M. Lonergan, Esq., Reading, first for white Spanish; Mr. Holton first for any new spring-sown onion; and Mr. Wadham first for Tripoli or Giant Rocca. Exhibition Marrow was the pea that secured a first prize for Mr. Emerton.

[illegible] were a splendid display, Mr. C. J. Waite winning for six dishes of [illegible] with splendid tubers of International, Windsor Castle, and Satis[illegible]; Mr. R. Holton, second; and Mr. O. Basile, third. Mr. Waite also [illegible] a dish of white kidney potatos, with International; Mr. Holton, [illegible] For coloured potatos Mr. Holton scored with Mr. Briscoe, the same [illegible] gaining second place for Mr. R. Wadham. The best round white potato [illegible] Castle, shown by Mr. C. J. Waite; Mr. Holton coming second, [illegible] Chamberlain third. For coloured round potatos Mr. Emerton came [illegible] Lord Tennyson. and Mr. Holton second. Several good collections of [illegible] were shown, Mr. Waite taking premier honours with cucumbers, [illegible], beets, radishes, lettuce, and celery; Mr. Wadham, second; and Mr. Basile, third. Mr. Emerton scored for shallots. Tomatos made a brilliant show, first prizes falling to Mr. Basile for Perfection and for three dishes. Mr. Emerton scored for green, and Mr. Waite for long white marrows.

Annual flowers were very bright, and made a fine show. The sets from Mr. Kleigh, Wimbledon, and Mr. F. Veale, Oxford, being especially good. Mr. T. Osman, gardener to L. J. Baker, Esq., Chertsey, had the best bouquet of annual and biennial flowers, using scabious and sweet peas. The carnations were poor as a whole, though Mr. Wood, of Reigate, showed fairly well; dahlias were also poor. Mr. Holton had the best dozen asters, and though the competition was keen, we have seen better flowers on previous occasions. Mr. Chamberlain scored for sweet peas, and Mr. Hawkins, Oxford, for mignonette, three bunches. African marigolds were popular, chief honours falling to Mr. Emerton, who was most successful also for French marigolds. Mr. G. T. Wood, Reigate, beat all comers for six bunches of pompon dahlias, but Mr. R. Robertson, Bromley, scored for cactus dahlias. Mr. Wood led the way for hardy herbaceous flowers, his phloxes, gypsophila, and solidago being especially good. Mr. Ede showed the best violas. Mr. F. Batt, of Norwood, led for asters in pots, and also for a lobelia, a first-rate specimen densely flowered. Mr. C. Moody, Penge, is a capital musk grower, winning both for the common and Harrison's variety; the same gentleman showed the best petunias, well-flowered double sorts, and he also beat all comers for Phlox Drummondi in pots and for stocks.

The chief honours for table decoration were easily won by Mr. W. Smith, Harrow, who had a simple but beautiful design in smilax, blue cornflowers, Iceland poppies, and gypsophila; Mrs. F. B. Williams, Blackheath, second. Mr. Wood, Reigate, had the best decorated epergne, carnations being chiefly used; Mr. R. Robertson, second.

The exhibition was held under the auspices of the Agricultural and Horticultural Association, Ltd., and the whole of the extensive arrangements were carried out in a most able manner under the management of Mr. E. Owen Greening, and the superintendence of Mr. George Waugh.

TROWBRIDGE HORTICULTURAL SOCIETY.

TROWBRIDGE gloriously maintained its old traditions on the 17th inst. In respect of its popularity as a horticultural exhibition as well as for its extent and general high quality, it is to the West of England what Shrewsbury is to the North Midlands. Despite the season there was scarcely a weak feature, and as a late rose show it was superb. The weather was very fine, the arrangements good, and there was an enormous throng of visitors. This was the forty-ninth consecutive exhibition, next year will be the jubilee of the society, and steps are already being taken to celebrate it in a fitting manner. Fuchsias always occupy a prominent place in the schedule, and Trowbridge is famous for the superb specimens it produces. The best six and the best four specimens came from Mr. G. Tucker, Hilperton Marsh, for many years gardener to the late Major W. P. Clark, of Trowbridge. As is usual, he had finely grown and bloomed tall, cone-shaped specimens, so well flowered that scarcely any foliage could be seen. His six plants consisted of Diamond Jubilee, Mrs. Bright, Charming, Doel's Favourite, Arabella, aud Western Beauty, the last a very fine light variety. Mr. G. Bridgeman, gardener to E. R. Trotman, Esq., Frome, was second; and Mr. H. Pocock, third. These three exhibitors occupied the same positions with four specimens, Mr. Tucker's first prize lot consisted of Final and Charming, darks; Surprise and Mrs. Roberts, light.

STOVE AND GREENHOUSE PLANTS were remarkably good. Some of the best we have ever seen at Trowbridge. The best nine were staged by that rising young cultivator, Mr. H. Matthews, gardener to Sir W. R. Brown, Bart., Trowbridge. He had splendid examples of Dipladenias Brearleyana and amabilis; a fine piece of Erica Eweriana elegans; E. Turnbulli; a splendid bush of Ixora coccinea, well flowered; Bougainvillea glabra, Stephanotis floribunda, Allamanda nobilis, and Anthurium Scherzerianum. Mr. G. Pymm, gardener to Mr. Gouldsmith, Trowbridge, was a remarkably good second. He had Bougainvillea glabra, a very fine specimen of Plumbago capensis, Erica ampullacea Barnesi, Clerodendron Balfourianum, &c. Mr. G. Tucker was a very creditable third. With six plants Mr. Tucker was first, having very fine examples of Bougainvillea Sanderiana, Clerodendron Balfourianum, Dipladenia Brearleyana, Allamanda nobilis, Statice Gilberti, and Ixora Morsei. Mr. H. Matthews was second; his best plants were Bougainvillea Sanderiana, Allamanda Williamsi, Dipladenia amabilis, and Erica Eweriana elegans. Mr. Tucker also had the best three, very good examples of Bougainvillea glabra, Dipladenia Brearleyana, and Ixora Tuckeri, a seedling of his own. Mr. S. Ager, gardener to Mrs. Mackay, Trowbridge, was second, the trio included a fine plant of Rondeletia speciosa major. The best specimen plant was a really splendid example of Erica McNabiana rosea from Mr. G. Tucker; Mr. Pymm was second with a small but well grown example of Erica Æmula; an extra prize being awarded to Messrs. E. S. Cole and Son, Bath, for a well grown and flowered Schubertia grandiflora.

Heaths were poor; they are a declining feature even in the West of England. Some very good gloxinias were staged for the season; Mr. G. Tucker was first, and Mr. S. Ager second. Begonias, single and double, very good; Mr. G. Tucker taking the first prizes in both classes with six finely grown and flowered specimens; Mr. G. Pymm was second with six single, and Messrs. W. J. Stokes and Sons, Hilperton Marsh, with six doubles.

Mr. H. Matthews was the only exhibitor of four orchids, taking the first prize with Phalænopsis Sanderiana, Dendrobium Schroederi, Ærides odorata, and Cattleya gigas. The best new or rare plant was a very good example of the white variegated Abutilon Swaitzi from Mr. Pymm.

Foliage plants were a good feature shown in collections of nine. Mr. H. Matthews was first; his chief plants were Kentia australis, Crotons Reidi, Weismanni, and Baron J. Rothschild, Theophrasta imperialis, &c. Messrs. E. Cole and Sons were second, having in their contribution a few fine palms. Ferns and mosses were shown in collections of fifteen, and there was a remarkably good competition, as many as five groups were staged. Mr. G. Tucker was first, Messrs. W. J. Stokes and Son second, and Mr. A. P. Stancomb third. It may be said the specimens were all good generally, though comprising nothing calling for special notice; Mr. Matthews had the best six caladiums, showing finely developed plants of leading varieties; Mr. G. Pymm had a close second. Coleus took the form of well-grown pyramids; Mr. Matthews was first, and Mr. Kiff, gardener to J. Kemp, Esq., Trowbridge, a very close second.

GROUPS OF PLANTS were a good feature, but to do them justice they should have a tent to themselves. Mr. Pymm was first, and Messrs. E. Cole and Sons second. Mr. Pymm made a bold group, having at the back palms, very fine Campanula pyramidalis, suitable foliage and flowering plants; Messrs. Cole and Sons also had a bright arrangement of cut flowers.

CUT FLOWERS.—Roses took a decided lead, Mr. J. Mattock, of Oxford, showing in very fine character, and it is long since we saw such very good roses staged at so advanced a period of the season. Mr. Mattock had the best twelve varieties, three trusses of each, having brilliant blooms of Madame Victor Verdier, Charles Lefebvre, Maréchal Niel, very fine in colour; Maman Cochet, Marie Van Houtte, Grand Mogul, Mrs. J. Laing, and Ernest Metz; Dr. Budd, Bath, was second, his leading blooms were Madame Hoste, Medea, Maman Cochet, Madame Victor Verdier, &c.; third, Mr. A. A. Walters, Bath. With thirty-six distinct varieties Mr. Mattock was again first, having fine examples of Her Majesty, Alfred Colomb, Mrs. J. Laing, Horace Vernet, H. Schultheis, Marchioness of Londonderry, Great Mogul, Fisher Holmes, Duchess of Bedford, L'Eclair, Madame Hoste, Princess of Wales, Kaiserin Aug. Victoria, &c.; second, Mr. Thomas Hobbs, Easton, Bristol. Mr. Mattock was also first with the best twenty-four and the best twelve blooms, chief among his blooms were Annie Wood, Mrs. J. Laing, Horace Vernet, Maman Cochet, L'Eclair, Maréchal Niel, Marie Van Houtte, &c.; Mr. A. A. Walters was second with twenty-four: and Dr. Budd third; Dr. Budd was second with twelve; and Mr. A. H. Grey, Bath, third. Mr. Mattock came in first with twenty-four teas, not less than twelve varieties, having in very fine character Maréchal Niel, Catherine Mermet, Anna Olivier, Madame Hoste, Princess of Wales, Maman Cochet, Luciola, &c.; second, Mr. C. T. Mattock, Headington; and Mr. A. H. Gray third. With twelve blooms also Mr. Mattock was first, and Dr. Budd second. With twenty-four dahlias, Mr. G. Humphries, Langley, Chippenham, was first; and Mr. J. Walker, Thame, second, though the latter, in our opinion, deserved the first prize, as his blooms were the freshest, brightest, and most perfect, an opinion in which both exhibitors coincided. Mr. Walker had finely-finished, though not quite full-sized blooms of S. Mortimer, Buttercup, Mr. J. Greaves, Florence Tranter, Nubian, Miss Cannell, George Wyatt, Arthur Rawlings, R. T. Rawlings, John Standish, &c. Messrs. J. Cray and Son, Frome, were first, and Mr. J. Lindsay, Frome, second, with twelve varieties. Mr. G. Humphries had the best twelve fancies, chief among them Hercules, Mrs. Saunders, Frank Pearce, Rev. J. B. M. Camm, Mabel, Dazzler, Comedian, Lottie Eckford, &c.; Mr. J. Walker was second. Mr. J. Burgess, Kingswood, was first with twelve bunches of single varieties, and Mr. Thos Carr second. With twelve bunches of pompons, Mr. J. Walker was first, and Messrs. Cray and Son second. Mr. George Humphries had the best twelve bunches of cactus varieties; Messrs. Cray and Sons were second.

Asters, though decidedly better than at Taunton, were not up to their usual mark, the Comet varieties being in the best character. Some very good hollyhocks were shown by Mr. Smith, of Kingswood. There were verbenas also, but they were very poor; sweet peas also, cut zonal pelargoniums, and very good carnations and picotees for the season. Mr. F. Hooper, Bath, was first in both classes. Cut flowers in twenty-four bunches were represented by stove and greenhouse plants of good character; Mr. H. Matthews was first, and Messrs. Stokes and Co., second. Gladioli were good, Mr. F. Hooper having the best twenty-four spikes, and for the dry season there were very good fancy pansies, Mr. F. Hooper also taking the first prize.

FRUIT.—The best collection of ten dishes of fruit came from Mr. W. Strugnell, The Gardens, Rood Ashton, and consisted of very good Alnwick Seedling and Muscat of Alexandria grapes, peaches, nectarines, plums, figs, &c. With six varieties Mr. Pymm was first; he had Black Hamburgh and Muscat of Alexandria grapes, peaches, nectarines, apples, and melons; Mr. Strugnell was second. A good smooth Cayenne pine won the first prize for Mr. C. Bull, Crediton. The best two bunches of black grapes were from Mr. A. Young, gardener to the Earl of Cork, Frome; Mr. J. Dole, Bristol, was second; in each case Gros Maroc was well shown. Mr. F. Smith, gardener to the Bishop of Salisbury, had the best two bunches of white grapes, other than Muscats, showing very good Buckland Sweet Water; Mr. J. Dole was second with the same. Mr. Smith had the best two bunches of Black Muscat, and Mr. Strugnell was second, both with Madresfield Court. Mr. Young was the only exhibitor of white Muscats, taking the first prize with two good bunches.

Melons were fully represented, and there were some good apricots, Moor Park predominating. Plums appeared to be generally wanting in ripeness. Cherries were represented by fine Morellos. The best dish of peaches was Violette Hative, from Mr. H. Clack, gardener to C. E. Colston, Esq., M.P., Roundway Park; Mr. A. J. Haynes being second with Barrington. Mr. Pymm had the best dish of nectarines, showing very fine Pineapple; Mr. Clack a close second with the same variety. Mr. Young had the best two dishes of dessert apples, having Beauty of Bath and Red Astrachan in excellent character; Mr. E. Fisher came second with Beauty of Bath and Irish Peach. Mr. G. Gerrish, Broughton Giffard, was first with two dishes of culinary apples, having very fine Emperor Alexander and Eclinville; Mr. E. Hall was second with Lord Suffield and Warner's King. Mr. Smith had the best two dishes of dessert pears, staging Souvenir de Congres and Bon Chretien; Mr. W. L. Mead was second with Jargonelle and another.

A very fine collection of bunches of garden roses was shown by Messrs. G. Cooling and Sons, of Bath; a thoroughly representative and highly meritorious exhibit.

ABINGDON HORTICULTURAL SOCIETY, August 18.

AFTER a lapse of a season, through lack of funds, this society held its twelfth show in the grounds of the Abbey House, the residence of E. J. Trendell, Esq., As far back as 1839 a floral society existed here, but after a chequered course it fell through. The present society was started as a cottagers' society, its earliest exhibitions being a kind of a political reunion, the funds for prizes and expenses being provided. The site of the show forms a portion of the once famed Abbey of Abingdon, and near the house may be seen what is termed "The Ruins," but which, in fact, is a representation of the old chapel which stood in another portion of the grounds, the stones which are much fretted and worn, having been brought to their present position. The chapel is roofless, and under one of the windows is a massive stone coffin, said to have held the remains of the founder.

The gardens were wonderfully bright, seventeen beds in geometric pattern being filled with pelargoniums, such as Henri Jacoby, Madame Crouse, and Souvenir d'Charles Turner, relieved by alternantheras in variety, Sedum glauca, and Echeveria glauca, mesembryanthemum, &c., with central plants of the variegated agave, blue gum, &c., the many vases of the walls being filled with Hydrangea hortensis, specimen fuchsias, petunias, and pelargoniums; the paths edged by blue tiles in cable pattern. Mr. J. Horsley is the gardener, and hot summers just suit him, as the land lies moist.

The schedule contained five divisions, with three classes open to all England; but the amount offered as prizes failed to attract more than two competitors for the three classes. For a dozen H.P. roses, in pairs, Mr. John Mattock took premier award for superior forms of Her Majesty, Charles Lefebvre, Marchioness of Londonderry, Eclair, A. K. Williams, Mrs. J. Laing, Grand Mogul, Ulrich Brunner, Abel Carriere, Madame S. M. Rodocanachi, Mrs. R. G. S. Crawford, and Horace Vernet, he being also premier for a dozen triplet teas, with grand blooms of Ernest Metz, Innocente Pirola, Madame Hoste, Catherine Mermet, Maréchal Niel (fine), The Bride, Marie Van Houtte, Souvenir de S. A. Prince, Princess of Wales, Miss Ethel Brownlow, and Anna Olivier; and as an extra he staged thirty bouquets in a dozen trusses each of tea-scented buttonhole roses, very tastefully mounted on black velvet. The first prize for two dozen dahlias was won by Mr. J. R. Tranter, Henley-on-Thames, who had some grand fancy forms and very bright colours, his selection being Mrs. Saunders, Plutarch, James Cocker, J. C. Read, Clara, Duchess of Albany, Crimson Globe, John Walker, Willie Garrett, Earl of Ravensworth, Hon. Mrs. P. Wyndham, R. T. Rawlings, Mrs. Gladstone, Mrs. J. Downie, Rebecca, James Vick, Shirley Hibberd, Matthew Campbell, John Henshaw, Pleasure, Florence Tranter, Dazzler, and Sunbeam.

The class for six plants was well filled, Mr. Aldworth, who secured the first prize with full-sized specimens of Brugmansia (Datura) Knighti, well flowered; Begonia Rex and B. metallica, Selaginella Mertensi, and a maidenhair fern; Mr. E. J. Trendell, was second, staging specimens of Dracæna indivisa, Acalypha muriaca, Lutania bor bonica, and a good Asplenium bulbiferum: Mr. Fawdry, gardener to G. Saxby, Esq., Northcourt House, occupied third place. In this section Miss Dodson, Lacie Court, and Hon. F. L. and Lady Mary Wood, The Abbey, staged a number of finely-bloomed fuchsias, agapanthus, ferns, &c., not for competition. For a pair of plants the Hon. F. L. Wood led with a large variegated agave and an agapanthus; Mr. Knight, gardener to A. E. Preston, Esq., Piccadilly, second, for Lilium auratum. The class for coleus was one of the best in the show, the plants dwarf-grown, fresh and bright, with a convex outline, G. Saxby, Esq., Mr. Ward, gardener to Mrs. E. Harris, Albert Park, and Mr. Knobes, gardener to Rev. W. Watson, The Vicarage, dividing the honours. Ferns contained no new forms, nephrolepsis, asplenium, davallia, pteris, and adiantum being generally staged. For six, Mr. J. Horsley led; and Mr. J. B. King was second for three; this last named had a good example of Todea superba. Begonias were not up to the mark, but fuchsias were above the average. Mr. F. Payton, Lombard Street, was first for three fuchsias, having good examples of Doel's Favourite, Mrs. Marshall, and Gustave Dorè.

A goodly collection of epergnes, &c., were arranged in the ladies' section. For an epergne for a dinner table Miss A. Humphreys led, with sweet peas, fern fronds, and panicles of gypsophila; Miss S. M. King second, with harpaliums, white sweet pea, begonias, &c., mixed with variegated ivy and vinca sprays. For a trio of vases Miss M. G. King took the award for arrangements of carnations, rose buds, Madame Crouse pelargoniums, and gypsophila; the best set of buttonholes were of pretty tea roses by Mrs. S. Holifield, Appleton. Mr. Payton led with show dahlias, medium size, but of spherical outline. Mr. A. G. Morris, gardener to F. C. Swindell, Kingston House, was premier for cactus forms; Mr. Knight second. Asters were generally under-sized, the best stand in the show being a dozen Comets; these were out of the running owing to the curious wording of the schedule Why quilled asters should be "German" and the remainder of the types "French" may become solved some day; the better wording of the two sections would be "quilled" "reflexed or incurved." A collection of eighteen varieties of scabious were staged by T. Tatham, Esq., which were much admired for their handsome development. Roses as shown by Mr. S. Holifield were popular kinds, only lacking a better style of mounting. There were some fine double zinnias, but the colours were limited; the bright eyed verbenas appeared to still command notice. Carnations of the yellow ground type were presented in numbers.

Fruit was excellent, and for a collection Mr. A. G. Morris was first with Alicante (wonderfully good for the period) and Foster's Seedling grapes, Sutton's Scarlet melon, July Gage plums, Moorpark apricots, and Royal George peaches; G. Saxby, Esq., second, with Beauty of Wordsley melon, Morello cherries, Moorpark apricots, Black Hamburgh and Foster's Seedling grapes and Alexandria Noblesse peaches; Mr. J. Horsley, third with a melon, apricots, Muscat of Alexandria and Black Hamburgh grapes, Alexandra Noblesse peaches and Humboldt nectarines. White grapes were generally Foster's Seedling, the awards going to Messrs. A. G. Morris and E. Aldworth; in the black grape class the order was reversed. Mr. Horsely, was first for peaches with fully ripe Alexandra Noblesse; Mr. J. Winter, gardener to E. L. Shepherd, Esq., Albert Park, second, with Royal George; Mr. Horsley, presenting the only fit dish of nectarines, Humboldt. The best melon was Hero of Lockinge, from Mr. Winter; the pears were Windsor and Jargonelle, the dessert apples being Irish Peach and Red Quarrenden. A very choice dish of red currants (Raby Castle), came from Mr. T. S. Simpson, the stalks of great length and berries large and brilliant. Plums were generally Orleans and River's Early Prolific.

Vegetables were a good feature though the number of exhibits were few. For four dishes of potatos in the members' class, Mr. A. G. Morris led with clean, large tubers of Chancellor, Satisfaction, Mr. Bresee, and Vicar of Laleham; while the best half dozen dishes in the cottagers' section came from Barnard West, Nuneham, who put up medium tubers but very shapely and bright: the varieties being Chancellor, Sutton's Seedling, Reading Russet, Edgecote Purple, Satisfaction, and Mr. Bresee. In the single dish classes, Mr. S. Abel, Bury Street, took several first prizes, his examples of Sutton's Satisfaction, and Chancellor being altogether good. The peas were generally Autocrat, and runner beans Ne Plus Ultra types. Autumn sown onions of the Tripoli and Giant Rocca class were generally weighty and well ripened, and the big forms of spring onions gave strong indications of belonging to the Ailsa Craig type. Short carrots are good, but the intermediate types appear to incline too much to the longer section. For Sutton and Sons' special class Mr. A. G. Morris led, putting up Sutton's New Red carrots, Satisfaction potatos, Ne Plus Ultra beans, Perfection tomatos, Ailsa Craig onions, and Autumn Mammoth cauliflowers; Messrs. Winter and Knobes, second and third.

BRIGHTON HORTICULTURAL SOCIETY, August 23 and 24.

THIS vigorous and admirably-managed society held its annual summer exhibition on the above dates under the most favourable climatic conditions. The exhibition was, as usual, held under the Dome and in the Corn Exchange, and in tents upon the lawn, and was fully equal to the average of the [illegible] exhibitions that have obtained for Brighton the reputation it enjoys as one of the principal centres of horticultural activity. The classes for specimen plants were not so satisfactorily filled as they have been on some previous occasions, but the falling off in this department was more than counterbalanced in other sections, more especially in those for cut flowers. The contributions to the leading classes for cut flowers were accommodated under the Dome, and the dahlias arranged along the front of the orchestra produced a brilliant effect, and afforded an excellent object lesson in the value of the cactus, single, and pompon varieties, for decorations on a large scale. Fruits, soft wooded plants, floral arrangements, and the miscellaneous cut flowers had a place in the spacious Corn Exchange, and the stove and greenhouse plants, groups, and vegetables were arranged in two large tents on the lawn. The arrangements were remarkable for their completeness, and reflected much credit upon the administrative abilities of the chairman, Mr. W. Balchin, and the secretary, Mr. J. Lewis.

SPECIMEN PLANTS were less numerous than at the exhibitions held during the past two or three years, but those contributed were fairly good. The premier award for six plants in bloom was made in favour of Mr. Offer, gardener to J. Warren, Esq., Handcross Park, Crawley, who had excellent examples of Lapageria rosea splendens, Allamanda Hendersoni, and Bougainvillea Sanderiana; Mr. E. Meachen was a capital second, his most noteworthy specimens being those of Allamanda Hendersoni and Stephanotis floribunda. Mr. Offer had a large and superbly-coloured example of Croton Weismanni in the class for a single specimen foliage plant, and obtained premier honours. Mr. Offer was first also for six exotic ferns, contributing specimens of large size and superbly finished, the most noteworthy being that of Davallia polyantha.

CUT FLOWERS were contributed in immense numbers, and constituted a feature at once interesting and attractive. Dahlias constituted an important part of the section devoted to cut flowers, and arranged along the front of the orchestra produced a brilliant effect. There were four entries in the great class for forty-eight show or fancy varieties, and the post of honour was occupied by Mr. S. Mortimer, Farnham, with superbly-developed blooms of Flag of Truce, J. T. West, Hercules, Henry Bond, Glow Worm, Kathleen, Henry Keith, Diadem, W. H. Williams, Mrs. Saunders, Mrs. Gladstone, Thomas Goodwin, Willie Garratt, Goldfinch, Duke of York, and other good varieties; Mr. F. W. Seale, Sevenoaks, was a good second with excellent blooms; Messrs. J. Cheal and Sons, Crawley, were third with blooms rather below the average in size, but exceedingly well finished; Mr. W. Peters, gardener to J. C. Hare, Esq., Holmhurst, St. Leonards, was fourth with well-developed blooms, which suffered somewhat from being staged on a light green stand. In competition for the prizes for twelve blooms of show and fancy varieties, Mr. T. J. Mitchell, gardener to Sir James Colquhoun, Bart., Hastings, Mr. H. J. Stenning, Tunbridge Wells, and Mr. T. Burtenshaw were awarded the prizes in the order of their names for blooms differing but little in relative merit. There were six competitors in the class for twelve varieties of cactus dahlias, six blooms of each, and the several collections produced a glorious display of colour. Mr. S. Mortimer was successful in obtaining premier honours, his blooms being large, fresh, finely-coloured, and effectively staged; Mr. J. Stredwick, St. Leonards, was a capital second with fairly-developed blooms, these including a new variety shown under the name of Magnificent, and having finely-formed flowers of a soft shade of light red; this had a first-class certificate conferred upon it by the judges; Mr. H. Shoesmith, Woking, was a close third with blooms of high quality. The successful exhibitors in the class for six varieties of cactus dahlias were Mr. Stenning, Mr. T. J. Mitchell, and Mr. J. Harper, Preston, all of whom had excellent collections. Pompon dahlias were admirably represented, and in the class for twelve varieties, ten blooms of each, Messrs. J. Cheal and Sons, Crawley, obtained premier honours with a collection of splendidly-finished blooms; Mr. J. Stredwick was second; and Mr. Seale third. Single dahlias were not less satisfactorily staged than were the blooms in the other sections, and in the principal class—that for twelve varieties, ten blooms of each—the post of honour was occupied by Messrs. J. Cheal and Sons, with blooms distinguished by their freshness and finish; Mr. Seale was a good second.

Collections of cut flowers of stove and greenhouse plants were, as is customary at Brighton, numerous and of a high order of merit. Mr. W. Archer, gardener to Mrs. Gibson, Hill House, Saffron Walden, obtained premier honours for twenty-four kinds with superb bouquets of Lapageria alba, Browallia elata, Euchris amazonica, Ixora Williamsi, Erica cerinthoides coronata, Allamanda grandiflora, and other good things. Mr. J. Davis, Cuckfield, was a capital second. Roses were well represented for so late in the season. Mr. W. Tayler, Hampton, and Mr. J. R. Box were first and second in the class for twenty-four varieties with medium-sized and fresh blooms, and Mr. G. W. Pipon, Uckfield, was a very close third with excellent blooms. For twelve teas, Mr. H. Harris, Horsham, Mr. G. W. Piper, and Mr. J. R. Box, Croydon, were the prizetakers in the order of their names with good blooms for the season. Gladioli were rather below the average of those staged at Brighton in past years, and it will suffice to say that Mr. J. Stenning and Mr. Peters were first and second respectively with neat spikes. Cut flowers of hardy perennials constituted a delightful and highly interesting feature. Mr. J. Charlton, Tunbridge Wells, was first with magnificent bouquets of Scabiosa caucasica, Helenium Biglowi, Crinum Powelli, Lilium auratum, L. speciosum, Rudbeckia Neumanni, Lathyrus latifolius albus, and other well-known hardy plants. Mr. W. Manton, Cuckfield, was second, and had a remarkably good collection. In the smaller class for twelve bunches, Mr. Mitchell was first with an admirable collection, and Mr. W. G. Anderson, Brighton, and Mr. Rapley, Withdeane, were second and third.

FRUIT.—The fruit classes were, as usual, well filled, and the majority of the entries in the numerous classes represented cultural skill of the highest order. Mr. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, was first in the class for three bunches of Muscat of Alexandria, with large shapely clusters, remarkable for the size and rich colour of the berries; Mr. W. Mitchell was second with clusters of medium size and superbly finished; Mr. W. Taylor, Tewkesbury Lodge, Forest Hill, was third with excellent bunches. For three bunches of white grapes other than Muscats, Mr. W. Taylor was first with magnificent examples of Buckland Sweetwater, Mr. W. Cheater was second, and Mr. T. Osman third. Two classes were provided for black grapes, and in that for Black Hamburgh Mr. W. Mitchell was first with splendidly coloured clusters, Mr. T. Osman was second, and Mr. J. Allan third. For black varieties other than Hamburghs Mr. W. Mitchell occupied the post of honour with superb examples of Gros Maroc, Mr. W. Taylor was a close second with Madresfield Court, and Mr. T. Osman third with Alicante. There was a keen contest for the prizes for melons, and for a pair Mr. F. W. Thomas, Polegate, was first with Hero of Lockinge and The Countess.

Peaches and nectarines were admirably shown, and for two dishes of peaches the Brighton Florists' Stores were first with Barrington and Violette Hâtive; Mr. G. Duncan, second, with Teton de Venus and Dymond. Mr. Mitchell staged remarkably fine fruit of Sea Eagle in the class for one dish of peaches, and was awarded the first prize. Nectarines were especially good, and splendidly finished examples of Downton secured the premier award for Mr. A. [illegible], Sevenoaks, in the class for a single dish. For two dishes Mr. F. Chatfield was first with excellent fruit of Pineapple and Elruge. Plums were well shown, and Mr. Dedman had the best four dishes, the varieties being Black Diamond, Washington, Victoria, and Purple Gage; Mr. Thomas, second.

The collections of fruit arranged with plants and cut flowers formed a very [illegible] feature, and the handsome silver cup presented by Mr. Councillor Stafford, [illegible] the first prize, was awarded to Mr. D. Gibson, Kingston-on-Thames.

DECORATIVE PLANTS.—The classes for these were mostly well filled, and in competition for the prizes for dracænas Mr. H. Garnett, Preston, obtained premier honours with well-finished and richly-coloured examples; Mr. J. Warren, Handcross, second. Crotons, grown in eight-inch pots, were highly meritorious, and Mr. H. Garnett was first with brightly-coloured examples, closely followed by Mr. Warren for second place. Gloxinias were considerably above the average, the collections from Mr. Boyling, Hurstpierpoint, and Mr. T. Fairs, Hassocks, who were first and second, were of great excellence. Zonal pelargoniums produced a bright display of colour. For four double varieties Mr. Meachen, Withdeane, was first with superbly-developed specimens: Mr. G. Miles, Brighton, second. Begonias made a bright display, and the first prize was awarded to Mr. E. Boyling.

GROUPS.—In the class for groups arranged in a semicircle occupying a space of 200 feet. Mr. G. Miles, Victoria Nurseries, Brighton, was first with a beautiful arrangement of crotons, caladiums, aralias, palms, &c. This group would have been perfect had it not been for the background being a little heavy. The second prize was awarded to Mr. Meachen, of Woodside, Withdeane, for a charming light arrangement. For a smaller group Mr. Turner took first with a pretty light arrangement; Mr. Sims being second. Groups of ferns were well shown, Mr. Adams, of Hornsey, near Lewes, coming in first.

VEGETABLES were well shown, especially potatos, carrots, and onions. The first prize for a collection of nine varieties was awarded to Mr. Gibson, of Kingston-on-Thames; Mr. H. Knight being a close second. For a collection of potatos Mr. Draycot, of Buxshall, Lingfield, was first; and Mr. Friend, of Rooks Nest, Godstone, was second. For a single dish of kidney potatos Mr. Burtenshaw was first, and Mr. H. Knight second, both with Duke of York. In the corresponding class for rounds, Mr. Mitchel, of Romsey, Hants, took first. Both dwarf and runner beans were well shown, in the former Magnum Bonum was prominent, in the latter, Best of All.

MISCELLANEOUS CONTRIBUTIONS were of much interest; Messrs. J. Veitch and Sons, of Chelsea, exhibited a large collection of flowering and ornamental-leaved plants and orchids, including many novelties. Mr. G. W. Piper, Uckfield, staged a large and tastefully arranged collection of tea roses; Messrs. H. Cannell and Sons, Swanley, presented a brilliant group of cannas; Mr. J. Charlton staged a fine collection of pompon and cactus dahlias. Messrs. Balchin and Son, Brighton and Hassocks, contributed a handsome collection of plants and cut-flowers. From Messrs. J. Cheal and Sons came an attractive table of plants, and Mr. J. Hudson exhibited a collection of new hybrid water lilies.

NATIONAL CARNATION AND PICOTEE SOCIETY (NORTHERN SECTION).

THE annual exhibition of this society was held at the Botanical Gardens, Manchester, on Saturday, August 13. Notwithstanding the somewhat unfavourable season, there was a good variety of bloom exhibited, although the exhibitors from the northern counties were not so well represented as usual, the bulk of the prizes going to the Midland growers. Some capital blooms were shown, the strongest sections being bizarres and flakes and picotees, while there was also a creditable collection of self colours and yellow grounds.

The arrangements for the show were carried out by a committee, of which Mr. T. Lord is secretary, and during the afternoon and evening there was a large attendance of the public.

In competition for the prizes for twelve carnations, bizarres and flakes, all dissimilar, Mr. R. Sydenham was first with George Melville, William Skirving, Seedlings (two) Master Fred, Rob Roy, J. S. Hedderley, Gordon Lewis, John Wormald, George Rudd, Seedling, and Mrs. Rowan. Mr. T. Lord occupied the second place with Bruce Findlay, Robert Houlgrave, Arline, Thaddeus, George, Mrs. T. Lord, Dan Godfrey, Robert Lord, Mrs. Shaw, Magpie, J. S. Hedderley, and Mrs. May.

The class for twelve picotees, white grounds, all dissimilar, was a good one. First, Mr. T. Lord, with seedling (four) Favourite, Thomas William, Mrs. Rodgers, Lena, John Smith, Brunette, Mrs. Gorton, and Mrs. Sharpe. Mr. R. Sydenham was second with Amy Robsart, Ganymede, Mrs. Gorton, Mrs. Payne, Mrs. Kingstone, Favourite, Muriel, Somerhill, Brunette, Mrs. Openshaw, Pride of Leyton, and Mrs. Beswick. For six carnations, Bizarres and Flakes, dissimilar, Mr. F. W. Goodfellow, Walsall, occupied the first place with a stand comprising Thaddeu, Charles Henwood, Martin Rowan, Sportsman, Robert Houlgrave, and Edward Rowan. Mr. A. R. Brown was a capital second with Robert Lord, Mrs. William Steele, Merton, Gordon Lewis, Medhurst's Seedling, and J. P. Sharp. Mr. F. W. Goodfellow obtained premier honours for six white ground picotees with Ganymede, Little Phil, Esther, Mrs. Gorton, Thomas William, and Brunette. Mr. C. Head, Hebden Bridge, second.

There was a good competition for the prizes for six selfs, and Mr. C.F. Thurston had the premier award made in his favour, his varieties being Duke of Orleans, Seagull, Miss A. Campbell (2), Sweetbriar, Mrs. E. Hambro (2), Exile (2), Mrs. James Douglas, and Emir. Mr. A. W. Jones, second, with Britannia (2), Seagull (2), Mrs. J. Douglas, Mrs. Mac Rae, Germania (2), Mrs. Colby Sharpin (2), Lady Hindley, and Gilda. Six selfs only.—Mr C. Head, first, with Exile (2), Miss A. Campbell, Nabob, Niphetos, and Mancunian; Mr. A. R. Brown, second, with Her Grace. Sweetbriar, Topsy, Regina, Germania, and Sadek. Twelve fancy or yellow ground carnations and picotees were admirably represented, and Mr. A. W. Jones, Birmingham, obtained premier honours with Voltaire (2), The Gift (2), Monark, Sport, The Wish, Eldorado (2), George Cruikshank, Wanderer, and May Queen. Messrs. Thomsons, Birmingham, were second, staging Voltair (2), Mr. Nigel, Golden Eagel, Monarch, Yellow Hammer, Perseus, The Gift, Mrs. Douglas, Xerxes, May Queen, and Ladas. For six fancy or yellow ground carnations and picotees, Mr. C. F. Thurstan was at the head of the competitors, staging The Gift, Voltaire, Golden Eagle, Mr. Nigel, Eldorado, and Yellow Hammer; Mr. H. G. Owen, second.

There was a strong competition in the classes for single blooms, and the awards were made as follows: Scarlet bizarres—Mr. R. Sydenham, first, with Robert Lord; Mr. T. Lord, second, with Robert Houlgrave. Crimson bizarres—Mr. T. Lord, first, with Bruce Findlay; Mr. R. Sydenham, second, with Master Fred. Pink and purple bizarres—Mr. R. Sydenham, first, with Sarah Payne; Mr. T. Lord, second, with Wm. Skirving. Scarlet flakes—Mr. W. Pemberton, first, with Sportsman; Mr. T. Lord, second, with Sportsman. Rose flakes—Messrs. Thomsons, first, with Mrs. Rowan; Mr. T. Lord, second, with Mrs. T. Lord. Purple flakes—Mr. Sydenham, first, with Gordon Lewis; Messrs. Thomsons, second, with Gordon Lewis. Heavy red picotees—Mr. T. Lord, first, with Brunette; Mr. A. R. Brown, second, with Ganymede. Light red picotees—Mr. T. Lord, first, with Thomas William; Mr. F. W. Goodfellow, second, with Thomas William. Heavy purple picotees—Mr. A. R. Brown, first, with Mrs. Openshaw; Mr. R. Sydenham, second, with Mrs. Openshaw. Light purple picotees—Mr. A. W. Jones, first and second, with Somerhill. Heavy rose, scarlet, or salmon picotees—Mr. C. F. Thurston, first, with Lady Louisa; Mr. R. Sydenham, second, with Mrs. Payne. Light rose, scarlet, or salmon picotees—Mr. T. Lord, first and second, with Favourite.

The premier prize for the best carnation in the whole exhibition was won by Mr. T. Lord, with Mrs. May, rose flake; and the premier prize for the best picotee was won by Mr. F. W. Goodfellow, with Mrs. Gorton, light-red picotee.

ANSWERS TO CORRESPONDENTS

Oil Stove for Greenhouse.—Colby, Harrogate: We do not advise oil stoves for heating, except in the case of small greenhouses and conservatories; but, unfortunately, you did not state the dimensions of your structure. We do not in this column recommend tradesmen of any kind, and, so, for a suitable oil stove, we must refer you to those makers who advertise in our columns. When writing to them, state the height, length, and width of your house; whether span, hip-roofed, or lean-to, and position; state also that you only require to have frost excluded, and whether the house has brick walls or wooden sides.

Nectarines Shrivelling.—W. R. C., Thelwall: Judging from the evidence you have afforded us, we should say that the shrivelling is due to dryness at the roots, while the mildew on the fruits is partially a result of the peculiar shrivelling of the skin and partially caused by the "muggy" atmospheric conditions to which you refer. See that the roots are well supplied with moisture, and take care that (especially as the fruits commence to ripen) abundance of air is allowed, and all plants below are removed so as to prevent a damp atmosphere. The water passing from the pot plants may not be sufficient to thoroughly moisten the border, but enough to moisten the atmosphere when no heat and little air are afforded.

Black Spot on Tomatos.—G.P., Thame, writes: "Mr. E. Beckett deserves our thanks for his article upon tomatos, published in a recent issue, but I should like some further information from him or any other large grower anent Black Spot on the fruit. In a house heated during spring and early summer I have tomatos planted out and badly affected with the spot, while in an unheated house two yards away, planted with tomatos, I have not had a single fruit diseased. Last year I picked the damaged fruit, as suggested by Mr. Beckett, but this season they have been left to ripen and then used for cooking, after a removal of the black area. I do not find the least difference in leaving diseased fruits on the plants; in fact, I have but comparatively few diseased fruits this year." We shall be glad to hear what others have to say concerning the infectious character of Black Spot.

Gerard on Potatos.—F. W. A., Bath: The full quotation you wish for from Gerard's "Herbal," of 1597, is as follows: "It groweth naturally in America where it was first discovered, as reporteth C. Clusius, since which time I have received rootes hereof from Virginia, otherwise called Norembega, which growe and prosper in my garden, as in their owne native countrie. The leaves thrust foorth of the ground in the beginning of May, the flowers bud foorth in August. The fruit is ripe in September. The Indians call this plant papus (meaning the rootes), by which name also the common potatoes [referring to the sweet potato] are called in those countries. We have the name proper unto it, mentioned in the title [*i.e.*, of Potatos of Virginia.] Because it hath not onely the shape and proportion of potatoes, but also the pleasant taste and vertues of the same, we may call it in English potatos of America, or Virginia. The temperature and vertues are referred to the common [sweet] potatoes; being likewise a foode, as also a meal, for pleasure, equall in goodnesse and wholesomnesse unto the same, being either rosted in the embers, or boiled and eaten with oile, vineger and pepper, or dressed any other way by the hand of some cunning in cookerie."

Selection of Tulips.—S. S. W., Bournemouth: The bulb catalogues are fast coming in now, so that it will be an easy matter for you to ascertain and compare prices, for almost all firms will post you a copy of their list on application. Bulbs of many kinds often fail to give the satisfaction they should, because they are not planted sufficiently early. Early-flowering tulips are of great value in the flower garden during the spring months. They will thrive in any well-drained soil, and the only points to which it is necessary to direct special attention are to plant early in the autumn, October being perhaps the best month, and to place the bulbs about five inches apart. In growing them for the conservatory, use five-inch pots, and put three bulbs in each. Van Thols may be forced in boxes or frames, and be potted up when coming into bloom. The best for forcing are Brilliant, red; Chrysolora, yellow; Duc Van Thol, scarlet, yellow, rose, and white; Joost van Vondel, crimson and white; Kaizer Kroon, scarlet and yellow; Ophir d'Or, gold; Pottebakker, scarlet; Proserpine, bright rose; Vermilion Brilliant, scarlet; and White Pottebakker. The best for the flower garden are: *Single.*—Artus, dark scarlet; Couronne Pourpre, purple; Crimson King, crimson; Duchess of York, cherry red and white; Tabiola, carnation flaked; Kaizer Kroon, La Reine, white and rose; Thomas Moore, orange; Vermilion Brilliant, and Yellow Prince. *Double.*—Couronne des Roses, carmine; Imperator rubrorum, bright scarlet; La Candeur, white; Rex rubrorum, scarlet; Tournesol, red; and Yellow Tournesol. *Parrot.*—Admiral de Constantinople, red and yellow; Large Yellow, Mark Graaf, yellow and scarlet; Monstre Rouge, rich crimson; the mixed selections are very effective. *Species.*—T. Clusiana, white and red; T. elegans, crimson; T. fulgens, violet crimson; T. Gesneriana, scarlet; T. Greigi, dark orange and black; T. macrospeila, red, black, and yellow; T. oculis solis, scarlet and violet; T. persica, yellow and crimson; T. retroflexa, red and yellow; and T. vitellina, yellow.

Names of Plants.—W. Y., Rugby: 1, Phlebodium aureum; 2, Asplenium Fabianum; 3, a Cratægus, and 4, an Anchusa—send in flower and fruit respectively.

G. G., Wandsworth: So far we have been unable to identify the oncidium you sent us. We shall be glad to have another specimen and also a leaf, if possible.

H. C., Hants: 1, Solidago canadensis; 2, Choisya ternata; 3, Kerria japonica fl. pl.; 4, Chrysanthemum maximum.

E. M., Hull: 1, An annual Linaria, florists' variety; 2, Diplopappus chrysophyllus.

W. R., Wimbledon: 1, Montbretia crocosmiæflora; 2, Diplopappus chrysophyllus; 3, Cladrastis amurensis.

S. M. C., Rutland: Yucca aloifolia.

C. P., Exeter: Veronica amplexicaulis.

F. R. J., Fulwell: 1, Erigeron speciosum; 2, Lilium tigrinum; 3, Solidago grandiflora; 4, Liatris spicata; 5, Kniphofia Tucki.

C. P. S., Retford: 1, Eulalia zebrina; 2, Campanula Mariesi; 3, Eryngium maritimum; 4, Epigæa repens.

OBITUARY.

MR. JOHN KNIGHT, for a considerable period superintendent of the private gardens at Hampton Court, died at his residence a few days since in his ninety-first year. Mr. Knight was appointed foreman of Frogmore Pleasure Grounds nearly seventy-three years ago, and for twenty years he was head gardener to the late Duchess of Kent. In 1861 he was transferred, by order of her Majesty and Prince Consort, from Frogmore to Hampton Court Palace, and until [illegible], when he retired upon a pension, he was superintendent of the Royal private gardens attached to the palace.

MRS. TAYLOR, the widow of the late George Taylor, of Stoke Newington, died, we regret to announce, at her residence at South Hampstead, on the 22nd inst., in her 84th year.

MARKETS.

Covent Garden.

THERE is a brisk demand for the ample supplies of fruit, while green vegetables are plentiful, good, and cheap. English apples, grapes, and tomatos find a ready sale at fair rates.

FRUIT.—English apples, 4s. to 8s. 6d. per bushel; Ports, 4s. to 6s. per case; pears, 3s. 6d. to 7s. per case; Dutch, 2s. to 2s. 6d. per molly; English grapes, 9d. to 1s. 6d.; Jersey, 8d. to 1s. per lb.; Denia, 5s. to 9s. per barrel; Spanish melons, 3s. 6d. to 7s. per case; green walnuts, 3s. to 4s. per bushel; lemons, 10s. to 18s. per case; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 5s. each; peaches, 1s. to 5s.; green figs, 9d. to 1s. 6d. per dozen; greengages, 9d. to 1s. 3d. per box, 4s. to 6s. 6d. per half-sieve; French plums, 3s. to 3s. 6d. per case, 3s. to 4s. 6d. per half-sieve; English tomatos, 3d. to 4½d.; Jersey, 2½d. to 3d. per lb.; Spanish, 9d. to 1s. per box; black currants, 5s. to 7s. per half-sieve; cobnuts, 3s. to 4s. per 12 lbs.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 8s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; asters, 2s. to 12s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; pansies, 1s. to 2s.; pelargoniums (scarlet), 3s. to 5s. per dozen bunches; stephanotis, 1s. to 2s.; lily of the valley, 6d. to 1s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—French beans and scarlet runners, 3s. to 4s. per bushel; peas, 1s. 6d. to 3s. per bushel; beetroots, 2s. 6d. to 4s.; cabbages, 3s. 6d. to 5s. per tally; mushrooms, 6s. to 8s. per 12 lbs.; turnips, 2s. 6d. to 3s. 6d.; carrots, 2s. to 3s.; parsley, 1s. 6d. to 2s.; leeks, 1s. 6d. to 2s.; mint, 2s. to 2s. 6d. per dozen bunches; cucumbers, 1s. 6d. to 3s.; endive, 1s. to 1s. 6d.; cauliflowers, 1s. to 2s. per dozen; celery, 12s. to 18s. per dozen rolls; lettuce, 9d. to 1s. per score; eschallots, 12s. per cwt.; vegetable marrows, 4s. to 5s. per tally; potatos, 60s. to 90s. per ton.

Borough Potato Market.

There are medium supplies and a moderate demand. Prices are not quotably altered. English Snowdrops, Early Puritans, and Beauty of Hebron, 3s. 6d. to 4s.; Sutton's Regents and Reading Giants, 3s. 6d. per cwt.

THE WEATHER DURING THE WEEK ENDING AUGUST 20, 1898.

The mean reading of the Barometer during the week at Greenwich was 29 88 inches, and that of the Thermometer 69°·5, the latter being 7°·7 above the week's average in the 50 years 1841–90. The direction of the wind was variable, the horizontal movement of the air being 1 per cent. above the week's average in the 16 years 1860–75. The duration of registered bright sunshine in the week was 61 hours. The measured rainfall amounted to 0·03 of an inch.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.
To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.
Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

Offices and Warehouses, **SOUTHWARK STREET, LONDON, S.E.**

THE "IVORINE WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

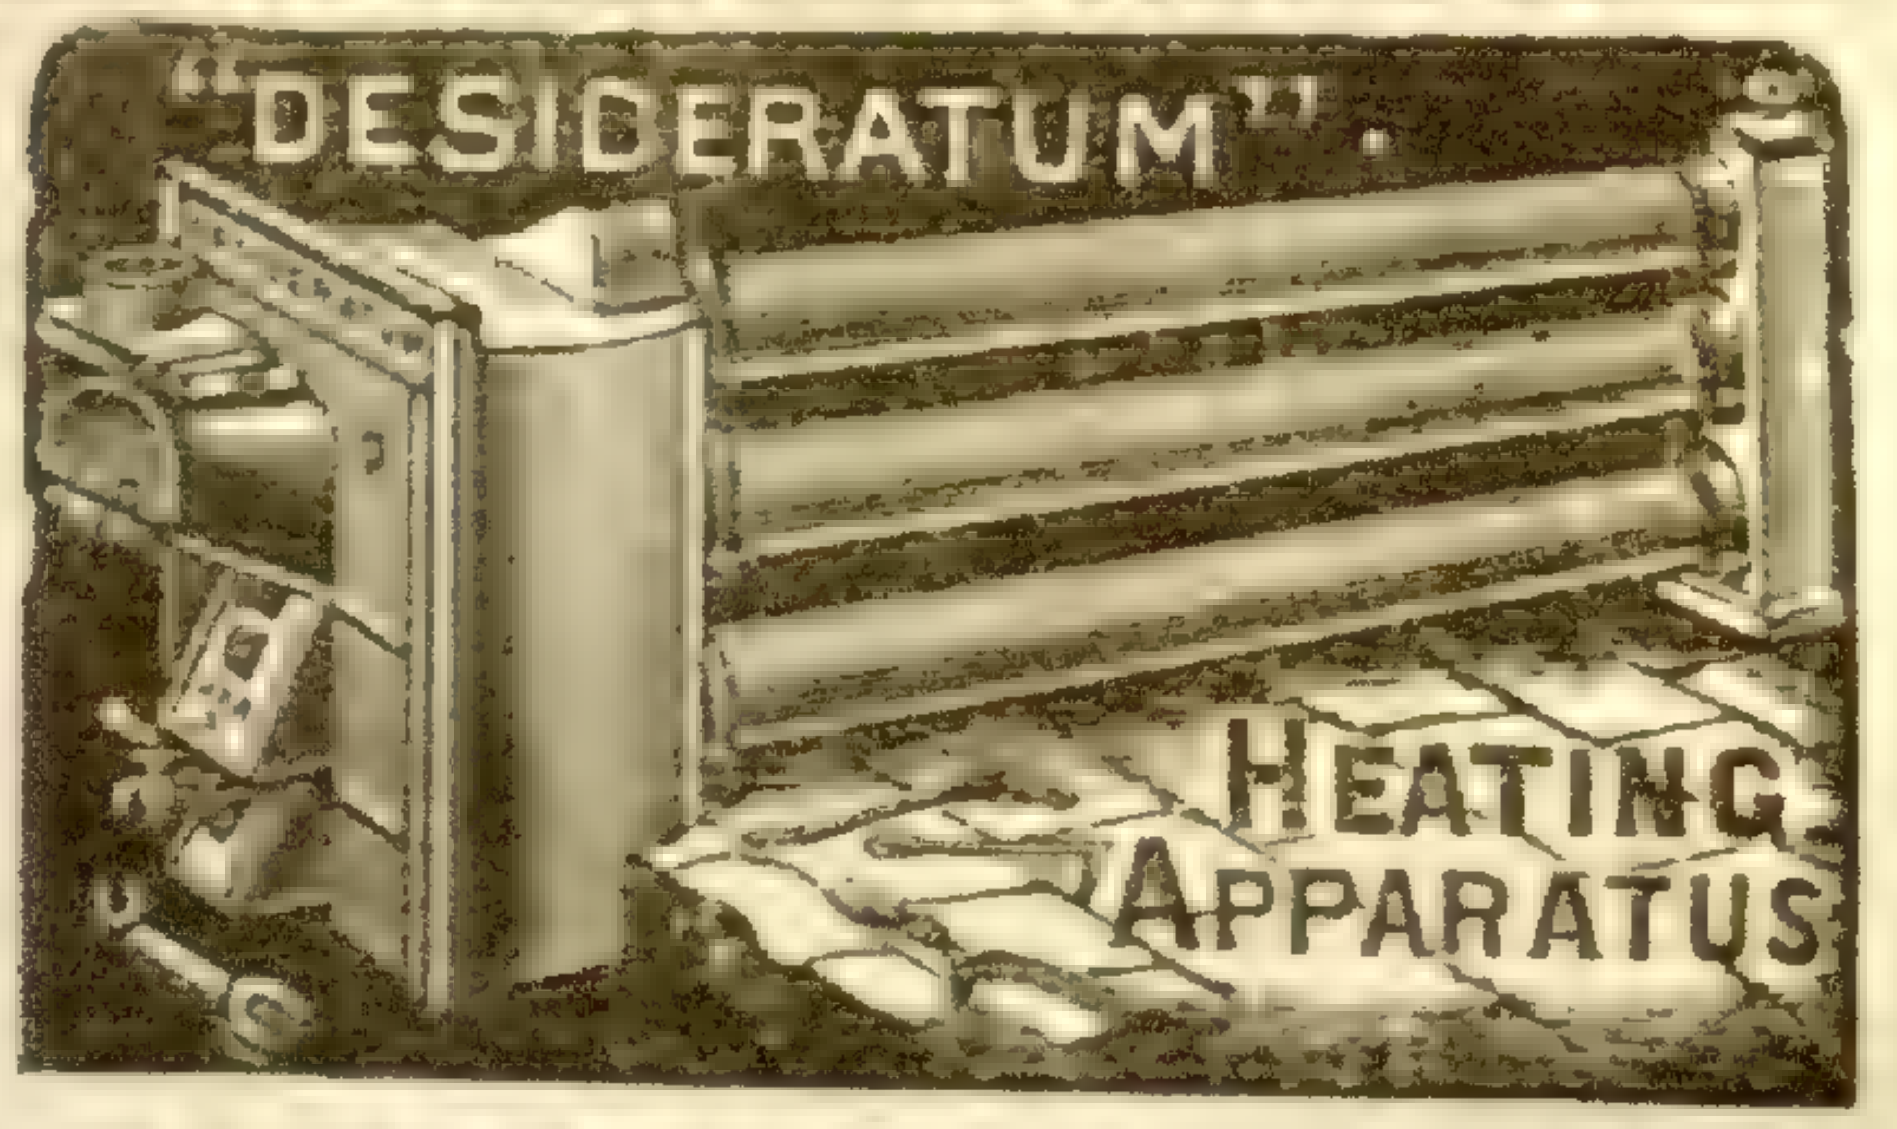
MEDALS AND HIGHEST AWARDS WHEREVER EXHIBITED.



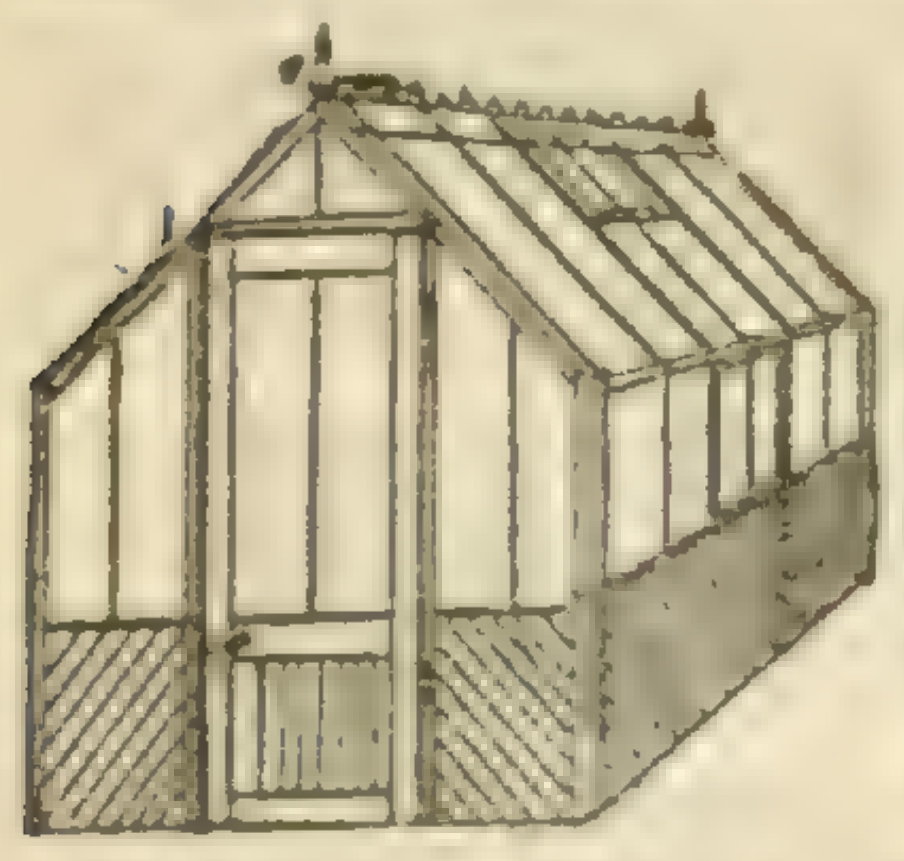
Supplied with various arrangements. Special Price List prepared for complete apparatus for Greenhouses 8 feet to 40 feet long. Estimates for larger Houses.

Works and Head Offices: STOURBRIDGE. London Branch: 35, Old Queen St., WESTMINSTER, S.W.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

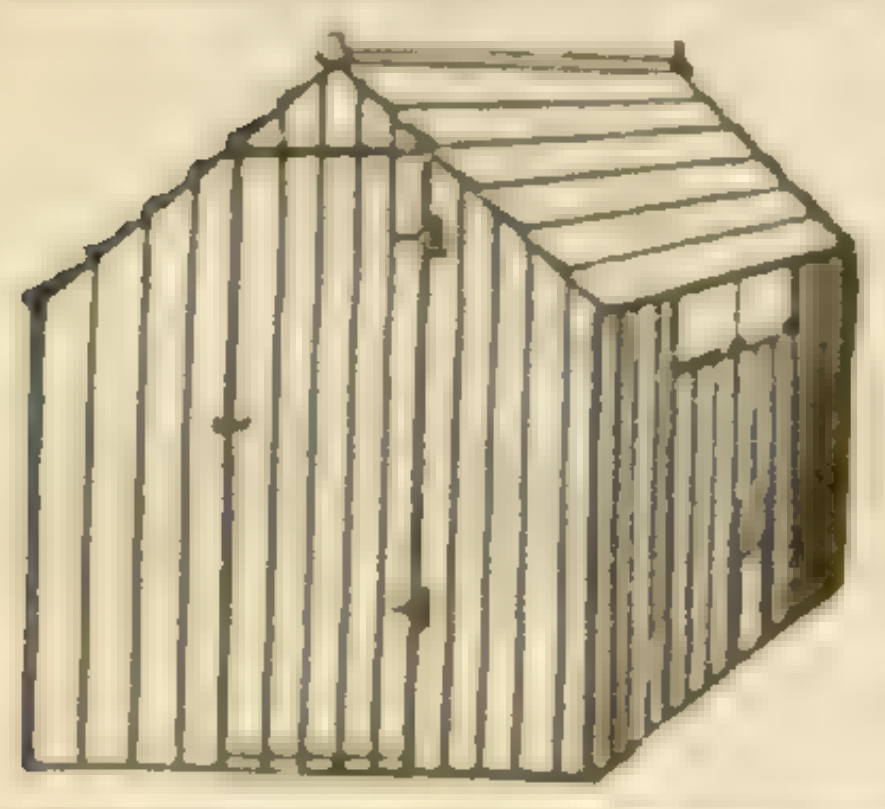


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more.

Speculate in a sample end, and set your doubts at rest



To hold.	Size.	Lean-to	Span.

PROTHEROE and MORRIS will SELL BY AUCTION, at their CENTRAL SALE ROOMS, 67 and 68, Cheapside, London, E.C., on the above dates, at Eleven o'clock each day, large consignments of named HYACINTHS, TULIPS, CROCUS, NARCISSUS, and other DUTCH BULBS, together with WHITE ROMAN HYACINTHS, and PAPER-WHITE NARCISSUS, received direct for unreserved Sale, and lotted to suit the Trade and other large buyers. Lots packed and forwarded to all parts.

The Auctioneers will be pleased to enter the names of intending purchasers on their Lists, who may desire a regular supply of Catalogues for their Autumn Sales.

On view mornings of Sale, and Catalogues had:

Bush Hill Park, Middlesex.

IMPORTANT SALE OF ORCHIDS, MONDAY, SEPT. 5, 1898, and GENERAL STOCK, TUESDAY, SEPT. 6, 1898.

MESSRS. PROTHEROE and MORRIS beg to announce that they have received instructions from Messrs. HUGH LOW and Co to SELL BY AUCTION at their PRINCIPAL NURSERIES, BUSH HILL PARK (near the Bush Hill Park Station of the G.E. Ry., Enfield Branch).

On MONDAY Next, SEPTEMBER 5th, a very important lot of some five or six thousand ORCHIDS.

On TUESDAY Next, SEPTEMBER 6th, an extensive stock of PALMS, STOVE and GREENHOUSE PLANTS, ROSES, &c.

The sale, which is made necessary by the near approaching termination of the lease of the Clapton Nursery, will commence each day at Eleven o'clock precisely. Catalogues free by post of the Auctioneers, 67 and 68, Cheapside, E.C.

Sidcup, Kent, S.E.

SEVENTEENTH GREAT ANNUAL TRADE SALE of WINTER-BLOOMING HEATHS, particularly well-grown, and beautifully set with flowers. Also CLIMBING ROSES, including some good pieces of Turner's Crimson Rambler, forming together one of the largest and best collections of plants ever offered by auction.

MESSRS. PROTHEROE and MORRIS will SELL BY AUCTION, on the PREMISES, THE LONGLANDS NURSERY, S.E., about 10 minutes' walk from the New Eltham (late Pope Street) Station, S.E.R., on WEDNESDAY next, SEPTEMBER 7th, at Eleven o'clock, by order of Messrs. GREGORY and EVANS, an enormous quantity of unusually well-grown plants, comprising:—

80,000	Winter-flowering Heaths.
10,000	Roses.
8,000	Solanums, well-berried.
4,000	Genistas.
6,000	Bouvardias.
1,000	Ficus.
3,000	Aspleniums, in 32's and 48's.
8,000	Pteris major, in 32's and 48's
5,000	Pteris Wimsetti and cristata.
2,000	Adiantum cuneatum, in 32's and 48's.
2,000	Adiantum decorum, in 48's.
1,000	Crotons.
1,000	Polypodium aurea, in 48's.
3,000	Kentias, in 60's.
1,000	Selaginellas, in 48's.
1,000	Double Primulas, in 48's.

Also an Immense Stock of Small Ferns and other Plants.

May now be viewed. Catalogues had on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C.

The Second Sale will take place on the Premises as usual on the FRIDAY in the Great Annual Trade Sale Week, viz., Friday, September 16th.

Dyson's Lane Nurseries, Upper Edmonton.

THIRTEENTH
GREAT ANNUAL UNRESERVED

TRADE SALE OF POT PLANTS.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. H. B. MAY to SELL BY AUCTION, on the PREMISES, as above, on MONDAY, SEPTEMBER 12, at Eleven o'clock punctually, upwards of 1,700 Lots of exceptionally well-grown PLANTS. The whole of the stock offered is in unusually fine condition, and to meet the growing demand larger quantities are offered, including a great number of novelties of sterling merit. The increasing patronage of the past few years is a sufficient guarantee that the Trade appreciate this Annual Sale. Special attention is called to:—

ROSES, which include large quantities of the best climbing sorts, with long, well-ripened growths; bush varieties include a grand lot of Bridesmaid, Belle Siebrecht, President Carnot, and others. Also TURNER'S CRIMSON RAMBLER.

BEGONIA GLOIRE DE LORRAINE in quantity, extra fine plants.

FERNS, including immense quantities of all the leading sorts, and many choice novelties.

PALMS, a splendid lot of Kentias and other useful sorts in various sizes.

TREE CARNATIONS, the newest and best sorts.

SOLANUMS, specially fine, forward, and well berried.

HYDRANGEAS, large stock of well-ripened plants for early forcing.

BOUVARDIAS, a very clean and healthy stock of all the best sorts.

LAPAGERIA ALBA, a large stock of healthy plants in various sizes.

ASPARAGUS, plumosus, Springeri, plumosus cristata (new) and others.

Crotons
Ficus elastica
Stephanotis
Erica hyemalis
Cyclamen
Ivies
Genistas
New Coleus
New Chrysanthemums
Clematis
Araucarias
Dracæmas
Aralias
Bamboos
Gardenias
Euphorbias
Poinsettias
Begonias
Fuchsias
Geraniums
Hydrangeas
Ampelopsis

And a great variety of other useful Flowering and Foliage Plants; also small Genistas, Heaths, &c., for growing on.

May be viewed. Catalogues had on the Premises; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Sales by Auction.

The Mill Lane Nursery, Cheshunt, Herts.

SATURDAY, SEPTEMBER 3, 1898.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

LOSS OF SOIL NITROGEN.

NITROGEN, even at the comparatively low prices that now rule for nitrate of soda and sulphate of ammonia, which are its two principal sources, is so costly a constituent of plant food that it is of primary importance cultivators should be fully acquainted not only with the methods of application and the effects upon crops, but with the losses that annually occur through the freedom with which nitrates are carried away by drainage water. The extreme solubility of nitrates, which are constantly being formed in the soil, has long been recognised by those who have devoted any considerable share of their attention to the scientific aspects of manuring, and cultivators who have been wise enough to combine science with practice are careful to so arrange their system of cropping as to prevent as far as possible the loss of soil nitrogen. How heavy these losses are under the ordinary conditions of soil management is very clearly shown in the records of the Rothamsted experiments. For upwards of half a century the rainfall at Rothamsted has been carefully recorded, and for nearly thirty years the drainage waters have been periodically measured and analysed, and the results obtained are of great practical importance. For the measurement of the latter three gauges, each with an area equal to one-thousandth of an acre, were provided, and these contain twenty, forty, and sixty inches depth of soil respectively. The soil has not been manured or cropped, but has been allowed to settle down naturally. The results of the analyses prove to demonstration the fact that water, in passing through the soil, carries with it an appreciable quantity of nitrogen. During the twenty years ending with [illegible] there was at Rothamsted an average annual loss per acre of [illegible] lb. through sixty inches, 30·83 lb. through forty inches, and 35·07 lb. through twenty inches of soil. The average of the three gauges is, therefore, 33 lb. per acre, a quantity equivalent to the amount of nitrogen contained in two cwt. of nitrate of soda. The results obtained in the four quinquennial periods of the past twenty years are of interest as showing that the average annual loss of nitrogen in the first quinqennial considerably exceeded the annual average for the twenty years, and that in the second and third quinquennials it was considerably less, and in the fourth quinquennial rather above the average. This is in some degree explained by the varying climatic conditions, for, as will be readily understood, the losses are much greater with an excess of rain and consequent increase in the flow of drainage waters. To wholly prevent the loss of soil nitrogen is, of course, impossible, but that much might be done to reduce it there can be no doubt. Where the land carries a crop through the winter, a considerable proportion of the nitrogen that in the case of unoccupied land would escape in the drainage water and be lost, is intercepted by the [illegible] utilized in plant nutrition. Hence the great value of catch [illegible] which find so much favour with farmers on light land. In the [illegible] is necessary to consider whether the advantages resulting from [illegible] pulverization of the land during the winter by frosts and [illegible] counterbalance or otherwise the loss of nitrogen, and this can [illegible] satisfactorily determined by those who have a full knowledge of [illegible] of the soil. It may, however, be stated that as a rule [illegible] soils should be dug over during the autumn or early in [illegible] more fully expose them to the action of the weather, while [illegible] from which the crop is taken towards the end of the summer [illegible] be sown with turnips or some other quick growing vegetables, to be [illegible] in towards the end of winter or early in the spring. The [illegible] and retain much of the nitrogen, and when buried [illegible] the soil and also add to the amount of humus, thus [illegible] the fertility of the land.

HEAT WAVES

[illegible] has been a great deal said and written lately about heat waves [illegible] with the unusually long spell of hot, dry weather under [illegible] the horticultural community especially, have been suffering. [illegible] however, can scarcely be justified, since, although the [illegible] may legitimately be applied to the infinitesimally small [illegible] part of the solar ray which conveys heat from its source [illegible] earth, it is misplaced in connexion with meteorological conditions conducive to abnormally hot weather. We might just as well talk of a rain wave or a fog wave when wet or foggy weather prevails, the fact being that spells of heat and cold, rain or fog, are all determined mainly by persistent aerial currents or their absence, and not to waves as popularly recognised. At this time of the year, given fair weather and southerly winds for any length of time, the earth's crust inevitably absorbs a vast amount of sun heat. The next result is a general drying of the surface, from which consequently much of the sunshine is reflected back into the air, warming it still more. Meanwhile in our insular climate the southerly breezes laden with water evaporated from the ocean, are not condensed on reaching the land as they would be under cooler conditions. Hence the rainfall is checked, and so, alas! are our capacities for perspiration, the air, hot as it is, being by no means so dry as it feels. This being so, the heat becomes oppressive, and man feels parched and dry, for the simple reason that his skin is not able to keep down the temperature by transpiration. In a Turkish bath we can stay for sometime with impunity in air heated above boiling point, but only so long as that air is dry, and so capable of taking up the copious evaporation from our bodies, which keeps our internal heat cooled down to 90 deg. Saturate that heated air with water and we should be in an atmosphere of steam which would parboil us immediately. Under Continental conditions of climate, where the air is drier, a much greater heat is easily borne with comparative comfort, and hence we see that, instead of a heat wave, if it were a wave at all, we should call it a wave of saturation. Let the wind shift to a dry quarter, and we may still register 129 deg. in the sun, and keep endurably cool. This is how it is that a shower on a hot day, welcome as it may be to vegetation, affords no relief to man, but, on the contrary, makes him feel the greater oppression, and this is how it is that when we do perspire our skins are clammy and moist, and even trickling, while under drier conditions of the air the moisture would evaporate immediately and insensibly, and thus, as in the Turkish bath, afford relief, though to all appearance it was non-existent. As regards vegetation, this condition of affairs is not so trying as to man, and accounts for the fact that despite the intense surface heat and long continued lack of rain, we have only to penetrate a few inches into the soil to find it moist and cool, so that all established plants, except very superficial rooters, are enabled to maintain existence, though naturally checked in development to a greater or less extent when the sun heat becomes excessive.

EXHIBITION SCHEDULES.

ONE of the most remarkable facts in connection with horticultural societies is the want of appreciation on the part of many of those responsible for their management, of the importance of clearness of expression in framing the conditions under which their prizes are offered for competition. This is no new thing, and we are unable to call to mind any season during the past thirty years in which our advice has not been sought on the all important question of the interpretation of exhibition regulations. The difficulties which annually arise through the ambiguity of the schedules became so great that a few years since the Council of the Royal Horticultural Society wisely undertook to prepare a code of judging with a view to remove some at least of them, and, as the result of the co-operation of the leading exhibitors and judges, a code was prepared of which it would be difficult to speak too highly. A large number of societies have taken advantage of the suggestions made, with the result that the annually recurring unpleasantness at exhibitions has been greatly reduced. But many societies continue in the course they have long followed, and from competitors at their exhibitions we receive complaints of their being deprived of prizes owing to the judges interpreting the regulations differently to themselves. In many instances we have, in reply, to say that the judges were right and the exhibitor wrong, but the latter is by no means invariably wrong. With a view to keep both exhibitor and judge in the proper course, we suggest that the statement as to numbers and kinds in each class should be so clear that they cannot be mistaken by those not skilled in solving difficult problems. The other day we had a case stated for our opinion, to this effect: "We offered prizes for twelve herbaceous plants grown in pots, and the judges awarded the first prize to a collection containing a caladium, a gloriosa, and a tuberous begonia. As the class was intended for hardy plants, the committee consider the collection should have been disqualified." We unhesitatingly replied that the judges were perfectly right in admitting the collection, and that they would have committed an act of injustice had they disqualified it. Caladiums, gloriosas a begonias are unquestionably herbaceous, inasmuch as their growth di down annually, and were, therefore, admissible. Judges have nothing do with the intentions of framers of schedules, except so far as they are expressed in the schedule, and in this case, if the committee had intended the class for hardy plants they should have said so ; and in all schedules exactly what is required should be stated. Many difficulties arise from the want of exactitude in the use of the terms "species" and "varieties, and these may be overcome by the use of the term "kind" in its proper sense. An interesting case occurred at Aberdeen the other day in which the exhibitor was disqualified, although we have no doubt he exhibited in strict accordance with the intentions of the framers of the schedule. The class was for "nine distinct varieties, but not more than two dishes of any species or kind of fruit," and as one exhibitor staged more than two dishes of peaches and nectarines his collection was disqualified, as peaches and nectarines are simply varieties of the same species, namely, Amygdalus persica. Had the term "kind" been used in its proper sense, no disqualification would, so far as we understand the case, have followed, representing as it does a race of fruits rather than any one species, and the peaches and nectarines, although varieties of the same species, form two races sufficiently distinct for exhibition purposes.

The Arctic Flora.—What we call the Arctic fauna and flora of to-day is apparently only the remnant of an assemblage of species varying in hardiness, which once extended from the Arctic circle almost to the Mediterranean. If climate and soil alone entered into the question, it is likely that the so-called Arctic flora might still maintain itself in many parts of Central Europe. This Arctic (or ancient European) flora includes many plants which are capable of withstanding extreme physical conditions. Some thrive both on peat and on sand, in bogs, and on loose gravel. They may range from sea-level to a height of several thousand feet. They can endure a summer glare which blisters the skin, and also the sharpest cold known upon this planet. Some can subsist on soil which contains no ordinary ingredient of plant food in appreciable quantity. Such plants survive in particular places, even in Britain, less because of peculiarly appropriate surroundings, or of anything which the microscope reveals, than because they can live where other plants perish. Ling, crowberry, and the rest are like the Eskimo, who dwell in the far north, not because they choose cold and hunger and gloom, but because there only can they escape the competition of more gifted races. The last defences of the old flora are now being broken down ; it is slowly giving way to the social grasses, the weeds of commerce, and the broad-leaved herbs of the meadow, pasture, and hedge-row. The scale has been turned, and this, Professor Miall, F.R.S., believes, has been accomplished not so much by climatic or geographical changes, as by the acts of man. Every lover of the moors would be glad to know that they bid fair to be handed down to our children and our children's children without diminution or impoverishment. The reclaiming of the moors is now checked, though not arrested, and some large tracts are reserved as open spaces. But the impoverishment of the moors goes on apace. A botanical exchange club has lately exterminated the yellow Gagea. Whenever a kingfisher shows itself, young men come from the towns eager to slay it in the name of science. No knowledge worth having is brought to us by such naturalists as these ; their collecting means mere destruction, or at most the compilation of some dismal list. If the selfish love of possessing takes hold of any man, let him gratify it by collecting postage stamps, and not make hay of our plants and mummies of our animals. The naturalist should aspire to study live Nature, and should make it his boast that he leaves as much behind him as he found.

Olearia Haasti.—Mr. J. Moore, the able head gardener at Ockenden, Cuckfield, sends us a fine spray of this beautiful New Zealand shrub, which he informs us was taken from a bush now about eight feet high and with a diameter equal to the height. The specimen in question occupies a prominent position at the end of a long herbaceous border, and for a period of nearly a month it was so densely flowered that hardly a leaf was visible. Mr. Moore believes, and we agree with him, that so beautiful a shrub should be more generally planted in gardens in which New Zealand plants are found to thrive than is at present the case.

Glover's Island, Richmond, is for sale, and the inhabitants of the fashionable borough are in great distress for fear that this pretty half-acre, situate in mid-stream a little beyond the Petersham Meadows, should be purchased by some advertising agency or for a soap works or other business, which would spoil the fine view now obtainable from Richmond Hill. The island is to be sold by auction on the 21st inst., and the Mayor of Richmond, Alderman Chancellor, is the auctioneer. Mr. Glover has offered the town the option of purchase until the 20th inst. at the reserve price of £4,000. It is possible that the town may purchase the island ; or, failing a grant from the Corporation, the townsfolk may subscribe the necessary amount. We think £4,000 an extravagant price for this half-acre lot, and regret that Mr. Glover, whose business as a boat builder owed much of its success to the beauty of the neighbourhood, should have placed a reserve of £4,000 upon a plot that he has now no further use for, owing to retirement, and which originally cost him about £100. It is a pity that corporations and county councils have not the legal authority to purchase, when for sale at a reasonable price, any land that it is necessary to preserve for the benefit of the general public.

Artificial Flower Odours.—A chemical industry, which has considerable interest for the horticulturist, was referred to by Dr. Symes at the Pharmaceutical Conference ; it is the production of synthetic ethers and odorous substances closely related to the odours of flowers, plants, and animal substances. With artificial musk and vanillin, pharmacists have been long familiar, as also with the amyl, butyl, and ethyl compounds resembling fruit flavours, but of more recent date they have heliotropine (heliotrope), ionine and iraldine (violet), cumarine (new-mown hay), terpineol (lilac), bergamiol or linaloyl acetate (bergamotte), nerolin (neroly), jasmin oil, anisic aldehyde (hawthorn), geranol (rose geranium), carvol (caraway oil), safrol (oil of sassafras), &c. So much has this industry grown, that not only are these products used for toilet soaps, but they also enter largely into the composition of the essences named after the flowers. They are more persistent than the natural odours, and it is said that the very popular essence of "Parma Violets" is, as a rule, quite innocent of the flowers, and is prepared from ionine mellowed down with small quantities of other extracts ; and this the public really prefer. To those, however, who are accustomed to handle delicate perfumes, there is not so much difficulty in distinguishing between the artificial and the real, and it still taxes the skill of the chemist and the art of the perfumer to obtain that subtle delicacy of fragrance manufactured and elaborated in Nature's own laboratory.

The Duke of Argyll's Friendship Trees, planted in the spacious grounds of Inverary Castle, are mementoes of distinguished visitors, consequently the garden is as interesting as the castle. There is a fine Cedar of Lebanon, commemorating a visit of Her Majesty ; Sir John Lawrence planted a Spanish chestnut in 1860 ; Dr. Guthrie one in 1863 ; Dr. Livingstone, in 1864 ; and Mr. Gladstone's Spanish chestnut was planted in 1865. The late Emperor Frederick of Germany planted a Wellingtonia (*Sequoia gigantea*) in 1863, and his consort a cypress. Earl Russell chose an oak tree to commemorate his visit. Lord Tennyson planted a Spanish chestnut and a cedar in 1857, and James Russell Lowell, on the occasion of his visit in 1880, planted a silver fir.

The Golden Wedding of Sir Edwin and Lady Saunders was celebrated on Wednesday last, and the event has created much interest in horticultural and medical circles, in both of which the venerable president of the National Chrysanthemum Society and Lady Saunders are so well known and highly esteemed.

Oak-gall Flies.—In speaking the other day at Cambridge on the surprises that await us in studying the life history of our commonest species, Sir John Lubbock referred to the cynips causing the galls as a proof of the correctness of his views upon this point. He said : "I will take one other case—the fly of the King Charles oak apple so familiar to every schoolboy. In this case the females are very common ; the eggs were known. But no one had ever seen a male. Hartig in 1843 knew twenty-eight species of cynips, but in twenty-eight years' collecting had never seen a male of any of them. Adler, however, made the remarkable discovery that the galls produced by these females are quite unlike the galls from which they were themselves reared, that these galls produced flies which had been referred to a distinct genus, and of which both males and females were known. Thus the gall flies from the King Charles oak apple (which are all females) creep down and produce galls on the root of the oak from which quite a dissimilar insect is produced, of which both sexes occur, and the female of which again produces the King Charles oak apple."

Rose Hybridisation continues, we are pleased to learn, to occupy the attention of Mr. Jackson Dawson, of the Arnold Arboretum, who gave us the Dawson rose. In referring to Mr. Dawson's work as a raiser of roses, an American contemporary observes : "The idea that hybrid roses could be made hardy by grafting on a hardy stock has been abandoned. Mr. Dawson now considers a new type necessary. This he is working for, and showing what cross breeding and selection will do, we need only look at Mr. Manda's hybrids and Mr. Dawson's with R. Wichuraiana. In choosing R. Wichuraiana and General Jacqueminot, two very distinct roses are brought together. Only an innate love for experiment could suggest such a proceeding. Some curious breaks, and some valuable ones, have come from these crosses. The indications are plain that, by following them up, infusing hybrid blood, and reverting occasionally for vigour, we shall have hybrids hardy enough to remain uninjured by any ordinary frost. There is a host to work with. Probably Crimson Rambler, in which we have remarkable colour and constitution, will help us to a new type of trellis roses. Some of Mr. Dawson's hybrids are already well known, and a few sent to England have been enthusiastically commented upon. The Dawson Wichuraiana-Jacqueminot, a climbing cluster rose with semi-double pink flowers, is a better trellis rose than the Crimson Rambler, though not equal to it in colour. Wichuraiana-rugosa is a delicate single rose with trailing habit—a splendid cover plant. Rugosa-Jacqueminot makes a fine bush with deep crimson flowers. Wichuraiana-Jacqueminot has produced two good double varieties almost equal to a hybrid in build of flower ; one is a delicate peach, the other deep pink ; both are of vigorous constitution. Numerous crosses were made this season, and some interesting information was gathered as to the manner of making them. If the flowers were left on the plants, the bees would get all the pollen before the operator, so they were brought under glass and ripened. A brush is considered wasteful, so the point of a knife is employed in collecting and applying the pollen. Boston Belle, an old rose of good constitution, was extensively used this season amongst these hybrids. Seedlings of Wichuraiana crossed by China roses will be watched with interest ; they are making pretty plants, all more or less creeping after the habit of the seed parent, but showing much variety in foliage, some being dark like the pollen parent.

The Queen's Tenantry at Osborne celebrated their Harvest Home on Saturday last, when Her Majesty entertained a party of about three hundred. Mr. Andrew Slater, the land steward, presided, and referred to the smooth and satisfactory way in which estate matters had proceeded during the past year, expressing pleasure at the presence of Her Majesty among them again. The toast of "The Queen" was honoured with enthusiasm, but that to the memory of the late Prince Consort was, as usual, received in silence. The healths of the Prince and Princess of Wales and the rest of the Royal Family followed. A p gramme of sports was subsequently carried out, and Her Majesty presented prizes, consisting of useful articles, to the successful competitors.

The Fruit Harvest in Cambridgeshire is not by any means so fine as the blossom of spring promised. Especially is the falling off of quantity seen in the Green Gage and other plum orchards, for where, in good years, ten tons of fruit were gathered, this season scarcely one ton can be obtained. The higher price obtained does not compensate for the loss of those advantages a plentiful year brings. Apples are a variable crop in the county, but bush fruits were good.

The Crowberry (*Empetrum nigrum*) is an interesting member of our moorland flora, and, as pointed out by Professor L. C. Miall, F.R.S., in his lecture at the London Institution, may be said to mimic the heaths, as a euphorbia mimics a cactus, or sarracenia a nepenthes. Similarity of habit has brought about similarity of structure. The crowberry, which is so like a true heath in its foliage and manner of growth, that even the botanists, who did not fail to remark that the flowers are altogether different, long tried to bring the crowberry and the heaths as near together in their systems as they could. The crowberry has the long, dry, wiry stems, the small, narrow, rolled, clustered, evergreen leaves of a true heath. The leaf-margins are turned back till they almost meet, and the narrow cleft between them is obstructed by close-set hairs, so that the transpiring surface is effectually sheltered. The crowberry is a peat-loving shrub, and is often found with ling and other heaths in the heart of the moor. The berries are a favourite food of birds, which help to disseminate the species. The crowberry has a wide distribution in the Arctic and Alpine regions of both the Old and the New World, and in Greenland the Eskimo use the berries as food and extract a spirit from them. The crowberry, in common with some other peat-loving shrubs or trees, has a peculiar root structure. The usual root hairs are wanting, and in their place we find a peculiar fungus growth, which invades the living tissues of the root, sometimes penetrating the cells. There is often a dense mycelial mantle of interwoven filaments, which covers all the finer roots. This looks like parisitism, but the fungus is apparently not a mere parasite, for the tree or shrub shows no sign of injury, but thrives all the better when the fungus is plentiful, and may refuse to grow at all if the fungus is removed. Rhododendron, ling, most heaths, bilberry, crowberry, broom, spurge-laurel, beech, and birch are among the plants which have a mycelial mantle. If the native soil which clings to the roots of any of these is completely removed, if the fine roots with the mycelial mantle are torn off in transplanting, or if peaty matter is witheld, the plant dies, or struggles on with great difficulty until the mycelial mantle is renewed. Such plants cannot, as a rule, be propagated by cuttings, unless special precautions are taken. Frank maintains that the mycelial mantle is the chief means of absorption from the peaty soil, and that the tree or shrub has come to depend upon it. The known facts render this interpretation probable, but thorough investigation is still required. In some cases at least, the plant can be gradually inured to the absence of a mycelial mantle. Professor Miall states that he has repeatedly planted the crowberry in a soil devoid of peat. It generally succumbs, but when it survives the first year, it maintains itself and slowly spreads. Microscopic examination shows that the roots of crowberry grown without peat contain no mycelial filaments, or very few. The special function of the fungus may be to reduce the peat to a form capable of absorption as food by green plants, and there can be no doubt that the fungus gains protection or some other distinct advantage from the partnership.

A Good Crop of Grapes.—From Mr. H. Godden, gardener to Mrs. Walker, Hillside House, Hythe, Kent, we have received a photograph of the interior of the Black Hamburgh house in the gardens under his charge. The photo graph is considerably above the average of those of vineries submitted to us, and very clearly shows that the vines are in the best possible condition and bearing a heavy crop of fruit, and also that the crop consists of finely-formed bunches remarkable for the large size of the berries.

The Hitchin Lavender Harvest of 1898 has been the best, both in quantity and quality, experienced for many seasons. In the winter of 1894-5 much damage was done to the plantations, but, with the assistance of more kindly winters of late, the damage was made good, and now the area under lavender is greater than ever. During the period of harvesting and distillation the town of Hitchin is deliciously scented with the pleasing odour produced by and from Lavendula vera.

Orange Blossoms cannot, according to Mr. U. Dammer, be obtained in Germany during the winter months in sufficient quantities for wedding decorations, and to meet the demand Staphylea colchica is forced as a substitute, providing abundance of white flowers which in appearance and fragrance so closely resemble the genuine article that the general public do not recognize the difference. It is said, also, that the flowers of Prunus chinensis are made to do duty for those of the myrtle. Staphylea colchica thrives very well in the open air, and blooms during May, some time before S. pinnata, the flowers of which are much like those of the lily of the valley.

Attar of Roses.—The production of attar of roses in Bulgaria during the [illegible] year amounts to 500,000 miskal, as compared with 600,000 miskal in 1897, and [illegible],000 miskal in 1896. In the latter year considerable difficulty was experienced by the distillers in disposing of their odorous product, which is now worth from three to four shillings per miskal.

The Irish Potato Crop shows a material diminution as compared with last year's crop, the decrease in the area being 12,304 acres.

Monsieur Cor, the French Consul at Hamburg, has received the decoration of an Officer of the Order Mérite Agricole in recognition of the services rendered to [illegible] at the Hamburg Exhibition in 1897. We have exceptional [illegible] in recording the honour conferred upon M. Cor, if only for the purpose of [illegible] the kindness received from him at the opening ceremony of that great gathering.

The Potato Crop.—According to the official returns the area under potatos in Great Britain is this year 524,591 acres. This is a material increase upon last year's area, but considerably less than the area under potatos in 1896 and 1895, and in fact of the whole of the years in the past decade with the exception of 1897 and 1894. The increase this year as compared with 1897 is 19,677 acres, and this extension of the area is no doubt due to the large increase in our imports of potatos since last harvest and the high prices that ruled until the lifting of this year's crop commenced. The largest area of potatos in Great Britain within the last thirty years was 627,691 acres in 1871, and the smallest, 502,719 acres, in 1876, the difference being 124,972 acres.

Florida Velvet Bean.—Under this name a leguminous plant has been prominently recommended in American journals as a forage plant and as admirably adapted for green crop manuring. Recently the beans have been offered for sale in this country; and, as frequent references have been made to Kew, it has been considered desirable to record in the current issue of the *Kew Bulletin* what is known of the plant and its capabilities. From the first it was conjectured that the seeds belonged to a plant very near the common purple-flowered Cowhage or Cow-itch plant of the tropics, Mucuna pruriens. The difficulty, in the absence of adequate specimens, in identifying it with this was the fact that in the Cow-itch plant the pods are densely covered with stinging hairs of a brownish colour. A plant so formidably armed, it was thought, could not safely be recommended for general cultivation. The name first given, Dolichos multiflorus (Dioclea Boykinii), was clearly wrong. In these circumstances we are glad to find that the plant has flowered and fruited in Queensland, and that Mr. F. M. Bailey, F.L.S., the Colonial Botanist, has identified it as Mucuna pruriens, var. utilis. In this variety of the Cow-itch plant the pods are apparently devoid of stinging hairs. It is probably M. utilis of Wall., described in the "Flora of British India" (vol. ii., p. 187), as "a cultivated variety" with velvety, not hairy, pods. This is figured in Wight's "Icones" (vol. i., t. 280). According to Watt's "Dictionary of the Economic Products of India," "the young tender pods are cooked and eaten as a vegetable." What may also prove to be the same plant, with jet black seeds, is cultivated as a rotation crop on sugar estates in Mauritius, under the name of "Pois Mascate." The accounts given by interested parties in America respecting the agricultural value of the Florida velvet bean must be received with caution. It is undoubtedly a rapid grower, and affords a large yield of nutritious forage. It bears an abundant crop of seed, and is, therefore, readily propagated. It may also, in common with many other leguminous plants, possess the power of obtaining its nitrogen from the atmosphere, and thus be admirably adapted for green crop manuring. How far it may be found superior in these respects to other plants it is impossible to say. As it is now being carefully tested in various parts of the tropics, it would be well to await reports which will, no doubt, be shortly issued on the subject.

Carthagena Oranges, with a very small proportion of lemons, were exported from Carthagena in 1897 to the extent of 6,083 tons, or 78,962 full-sized boxes; of this quantity, 5,913 tons came to Great Britain and 170 tons to France. This trade is largely on the increase, and Carthagena promises to become an important shipping port for this class of fruit from inland districts, unless the producers again find cheap transport to the Paris market. Carthagena also shipped about 200,000 kilos. of almonds, principally to France, in 1897.

The Flower of the Gods.—Disa grandiflora has of late been flowering freely and vigorously in the cool orchid house at the Royal Gardens, Kew. It is a beautiful orchid from the Table Mountains, but one that is not always cultivated with success. On many occasions we have published in these columns descriptions of the methods of cultivation that have proved successful in Edinburgh, in Kent, and elsewhere, and also interesting matter supplied by our Cape correspondent, Mr. W. Matthews, anent its habitat, together with accounts of several other beautiful members of the genus. On Tuesday next a paper is to be read upon the genus Disa by Mr. T. W. Birkinshaw, before the Royal Horticultural Society, at the Drill Hall, St. James' Street, Westminster. The lecture commences at three p.m.

The English Hop Crop.—The area devoted to the cultivation of hops in England continues to decrease, and this year 49,735 acres are devoted to hop cultivation, as compared with 59,535 acres in 1894. This is the fourth consecutive year in which a contraction of area has been recorded, though the diminution to the extent of 1,128 acres this year is less than that of 3,354 acres last year, or of 4,723 acres in 1896. The county losses include decreases of 720 acres in Kent, 345 acres in Sussex, 103 acres in Surrey, 43 acres in Hants, 24 acres in Worcester, and three acres in Salop; against these have to be placed gains of 109 acres in Hereford and one acre in Suffolk. The estimated yield for the current year is 8·08 cwt. per acre, this being the lowest since 1893, when the yield was 7·21 cwt. per acre. Accepting this estimate as correct this year's crop of hops will be the smallest that has been harvested since 1890.

Horticulture at the French Exhibition, 1900.—The buildings of the great exhibition to be held in Paris in 1900 will include a horticultural palace of large proportions and handsome elevation, from designs by M. Ch. Albert Gauthier, who will also have charge of the construction.

Lilium auratum, the Golden rayed Lily of Japan, is remarkably well managed by Mr. Wm. Jones, gardener to P. J. Bargs, Esq., Ellesmere Lodge, Snaresbrook, who has sent us a photograph of a specimen that has been in cultivation for six years and has improved each year. This year the bulbs produced eight growths, and an aggregate of forty-nine blooms, the strongest spike carrying fourteen flowers. Mr. Jones states that, after flowering, the specimen is gradually dried off, and then placed under a stage in a vinery; all the old soil is removed previous to repotting in November, and to the compost of loam, leaf-mould, peat, and sand, a little bone meal is added.

APPLES IN NORTHUMBERLAND.

THE season has again come round when we naturally consider the pros and cons of the several systems of growing fruit. Where there are large demands for fruit, one is compelled to adopt methods which are most productive. This trying season has again shown the advantage of growing the apple on the Paradise stock in this district. A large number of the dwarf bush trees are in the most perfect health that we could desire after this very dry season; many of them are bearing such splendid crops that we have been obliged to place stakes for their support. The fruit is holding on better than we expected five weeks since, when Nature usually thins the crop. This season has shown that the dwarf open bush form of tree is about the best to grow. Three years ago, when a frost on May 20th did so much damage to the apple blossom, the flowers on the orchard standard trees were largely destroyed, but we had eventually a splendid crop set on most of the dwarf bushes. We have now had bush trees at Alnwick for sixteen years, and are quite satisfied that it is the best style of tree for providing a crop in the worst of seasons. This I would especially emphasise is for gardens. Orchards should have trees on the free stock where there is plenty of room, but even in orchards the dwarfs could be planted between the standards to produce fruit the first ten years, while the bigger trees were becoming established.

The site for planting any and every fruit tree should be carefully prepared. Trees are a failure very frequently because this is not done. No one description can explain how this should be done, because of the variety of soils to be dealt with. The subsoil should be in a sweet condition, not sour through lack of drainage, for if it should be the trees will be injured by canker. We find that where there is a fairly dry clay under about fifteen inches of soil, the trees should be planted fairly high, with a little mound around them. In our dry, light, sandy soil, we are obliged to mix a compost of any good soil that can be spared with the staple, and we place a layer of clay three inches thick, twenty-two inches or so deep, and over the bottom of the hole, mixing some of it through the compost. This mixture has kept our trees in good bearing condition through a number of years. The roots fill this healthy compost, to which lime rubbish and hotbed manure are added, with a mass of roots that need much water and plant food to sustain the trees in fruit-bearing condition. Our practice has been to give 7 lbs. to the perch of a good artificial manure, rich in phosphates, potash, and nitrogen. This is done once only during the spring, when a light dressing of old hotbed manure is also dug in the borders. The exceptionally healthy condition of our trees this season is no doubt partly due to there being plenty of plant food for the roots, and partly to the effect of the application of that very fine insecticide, ½ lb. caustic soda and the same quantity of pearl ash to every five gallons of water, dissolved by pouring hot water on each separately, mixing, and then thoroughly syringing the trees with it during March before the buds begin to open. This strength is not for trees in leaf. One hears so many complaints of the destruction of the leaves by red spider and fly. This remedy for spider should be tested by anyone anxious to secure healthy trees. The trees noted as being so healthy were not so a few years ago, but were badly affected with red spider. They were syringed two or three years in succession, but being so clean they were not dressed last spring, and yet are exceptionally clean and healthy. The best specimens of our bush trees are trained low by cutting out the centre shoot when the trees are young, and training the branches as regularly as can be, and allowing the leading shoots about a foot or fifteen inches increase every year. We spur back all the side shoots at the winter pruning, and keep the branches wide apart, so that the sun and air may ripen the buds for the following season. Unless this is done crops of high class fruit cannot be grown year after year.

After all, a great point for success is to plant free-fruiting kinds. We have tried a large number of varieties, and some have not proved sufficiently constant in bearing. We also have many on trial of which we hope to speak another season. In private gardens a goodly number of varieties are useful, as all kinds do not crop well every year, but still several varieties are almost regular croppers. The earliest kitchen apple we gather is Red Calville, a red apple, and on either stock, a real good cropper, always safe to plant for early gathering. Of the Keswick Codlin type, Domino is the most constant heavy cropper that we have; during the last few years it has been heavily cropped, and is so now. Lord Grosvenor is another heavy cropper in orchard or garden; Grenadier is good, and Ecklenville Seedling, which I have often said should not be freely planted, is splendid this season. I would leave out Lord Suffield, as its constitution is not good in many places, but where it does succeed there is no apple that we can name superior to it, both in quality and crop, to be used from the middle of August to the middle of November. Duchess of Oldenburg is a small but useful variety. Royal Jubilee promises to be a first-rate early, though it is exceptionally late in flowering, the buds expanding when the most injurious frosts are usually past. None of the previous mentioned kinds are of use beyond the middle of November.

For use from that time to Christmas Stirling Castle is one of the most certain to crop, but does not make much wood even on the free stock; the fruits, however, hang like ropes of onions sometimes. Northern Dumpling is large and free, one of the most popular in Scotland and good here. Warner's King is fine for Christmas, but does not fruit so soon after planting as many kinds do, but when it comes of age it is splendid. Gascoyne's Scarlet is fine, so also is Bismarck.

For late use Lane's Prince Albert is one of the most certain croppers, and Bramley's Seedling one of the latest keepers, bearing heavy bunches of fruit. Newton's Wonder takes some five years to make a start, but after that is a regular cropper. New Northern Greening, Loddington, Dumelow's Seedling, and Alfriston, are all good and late kinds. This list may be trusted by those who have not sufficient experience to guide them, for the varieties are selected as a result of careful observation during many years. There are many other kinds doing well in this county, but the above are worthy of cultivation, even in a large way, with a certainty of success if good trees are carefully planted.

We cannot speak with the same emphasis respecting dessert fruits as with the kitchen sorts, but we are far more hopeful now than some years since that there are many kinds of apples which will bear freely on the Paradise stock here, and are useful for dessert even when grown without the protection of a wall. Irish Peach, Lady Sudeley, Worcester Pearman, and Red Astrachan are good; Schoolmaster is also said to be good. It is cropping well here, but we have not tasted the fruit yet. Scipton Shield is a free cropper, and we are assured that James Grieve is free and good. Mr. Gladstone crops freely, but is not of the highest flavour. In the northern counties the protection of a wall is needed for dessert apples. In the third week in August we gathered Beauty of Bath, nice fruit, and in the last week we had Lady Sudeley, beautiful from a south wall, finely coloured and large fruit. Worcester Pearmain will soon follow. Then we have Cox's Orange Pippin, the richest flavoured of apples, but not so heavy to crop as the Ribston, which is again splendid.

Alnwick Castle Gardens. GEORGE HARRIS.

ANTHERICUMS.

ALTHOUGH a fairly large genus, only a few species of anthericum, fortunately the most showy and hardy, are in culture, and constituting some of our most useful of perennials, being equally well adapted for beds, borders, for rockwork, or pot culture. To ensure success it is most important that all anthericums should be planted at a time when they are at rest, or seemingly so, this being soon after they have died down, and in the early part of autumn. They are not very particular either to soil or situation so far as most species are concerned, but such small-growing kinds as A. serotinum are best planted on the rockery only.

A. liliago (St. Bernard's Lily) has a fleshy root stock, whorl-shaped, similar to that of the asphodel and eremurus; the leaves are narrow, linear, and channelled, glaucous green, about a foot long. Stem about two feet high; flowers racemose, star-shaped, pure white, flowering in May and June. The plant is common in Central Europe, on dry hillsides usually, and in sunny positions.

A. liliago major (*Phalangium algeriense*) has leaves about eighteen inches long and half an inch in width, light glaucous green. Flowers large, star-shaped, pure white, stem wiry, two to three feet high; flowers produced in May. This is a very pretty Mediterranean plant, locally common in Algeria, where it is found among low-growing shrubs. It is perfectly hardy here, but not before it is thoroughly acclimatized after importation. Fortunately it is easily increased by division, so that there is always a good supply without resorting to importation. A. graminifolium (*A. ramosum*) has linear, grass-like leaves six to nine inches long and glaucous green; stem two feet high, much branched; flowers small and pure white, produced in July, and continuing often till November. Found growing on hillsides among low growing shrubs and grass in Central Europe.

A. liliastrum (Paradise lily) is also known under the name of *Paradisia liliastrum.* Its rootstock is fleshy and whorl-shaped; stem simple, eighteen inches high; flowers racemose, campanulate, large, and lily-like, pure white, and sweetly scented. The leaves are linear, a foot long, and about three-quarters of an inch in width; light green. A noble plant for gardens, and easily grown. A native of the Alps of Switzerland. A. liliastrum major is a taller growing, larger flowering form, from the Pyrenees. At one time this plant was fairly plentiful, but owing to collectors not only taking too many plants, but often destroying what they could not take away, in order, I suppose to defy competition, it is now not common. This form, like the type, is, however, easily increased, and I have never known of a failure, unless it were due to transplanting at the wrong time of the year. Plants should only be moved during the autumn, or early part of winter, unless grown in pots. Mr. Ware, of Tottenham, was the first to introduce this plant to cultivation.

A. Hookeri (*Chrysobactron Hookeri*) has a fleshy, whorl-shaped rootstock, of a brownish or bronze-yellow colour; leaves linear, fleshy, or succulent, one inch broad, and six to twelve inches long. Stem naked, three to five feet high; flowers racemose, bright golden yellow, star shaped, about half to one inch across. This does best in good rich soil, fairly moist, and half shady. It is from the Alps of New Zealand, and when well grown is a very showy and distinct plant. A. Rossi is not known to me, and is, I believe, not in culture at the present time.

A. serotinum (*Lloydia serotina*) is a very interesting and pretty but tiny plant, consisting of a semi-bulbous rootstock and a few linear, grassy-like radical leaves, which are usually six inches long; the cauline leaves are lanceolate, short, the upper bract-like. Flowers pure white, terminal, segments oval or elongated. This truly Arctic plant is, in the temperate part of Europe, only found where the northern flora still exists. It is said to be found on Snowdon, in Wales, and I have several times found it on the high Alps, also on the Brocken and the Giant Mountains, growing among grass in stony soil.

G. REUTHE.

White Cos Lettuce.—After having seen so many thousands of lettuces this season, partly owing to the drought and partly to bad strains, running off to flower prematurely, and bringing disappointment to the growers in all directions, it was a treat to see such grand heads or hearts as I saw a few days since in the gardens of Maiden Erleigh, Reading. Mr. Turton, who spoke in high praise of the variety, said that it was better than Superb White. I could but wish that our Surrey cottagers and allotment holders could obtain such a stock as that, as then they would have good lettuces to exhibit rather than rubbish, such as we have seen so generally this year. The variety is of the Paris White stock, and reminded me of one known as the Alexandra cos that was such a fine hearter and long-stander some twenty years since. It is of great service to know that during hot, dry summers, with good cultivation, such splendid long-standing lettuces may be had in plenty.—A. D.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

ONE thousand pounds a-year! Where is the man who still says there are no openings in our profession? Is the sum indicated a mere bagatelle in these days? I venture to prophecy that the appointment of Dr. Morris by the Colonial Secretary, to the superintendence of the botanical investigations in the West Indies, will have a result not anticipated by either of the two gentlemen. Hundreds of fathers, harassed by the old problem —"What shall we do with our boys?"—will read the paragraph with watering mouths, and straightway devote young Verdant to gardening. And then they will wait expectantly for another important colony, or set of colonies to get into difficulties, so that Verdant, now doctor or professor, may help them out.

IT may be a long time before another plum drops as juicy and well-flavoured as this. When it does, may there be another man ready to catch it, who is as earnest and competent as the Kew second in command. I have had some little intercourse with Dr. Morris, and I have observed in him, quiet self-command, sound mental equipment, and obvious sincerity of purpose. He is not a showy man, perhaps not even a brilliant one, but he is an excellent botanist and a sensible man of the world. £1,000 a-year is a good deal of money, but he is worth it.

IT is pleasant to find such swift corroboration of my recent remarks on the black currant mite. It is equally pleasant to be in such good company as that of Mr. T. F. Rivers. I daresay someone will be coming along very soon to declare that we are both wrong, but I beg to give the gentleman who does so fair warning in advance that he has a third party to reckon with in the fight. The bridge of culture will be held by no less a trio than Horatius Rivers, Herminius Lux, and Lartius Peter. (Being somewhat proud of this classical simile, I mentioned it to Peter, who remarked that, for his part, he'd rather handle a bit of blackthorn in a shindy than larch.) We do not believe any grand remedy for the evil is called for, either in the way of stocks or vaccination. We believe the bushes want growing. And even in the case of black currants perfectly free from the mite, feeding and knifing are beneficial.

Peas are an important garden crop, and we are all very much obliged to the Board of Agriculture for issuing a leaflet about them and their particular enemy, the thrips. If the Board could tell us how to have abundant crops in August and September, as we have them in June and July, it would be doing a national service. But the Board does not do this; it limits itself to telling us to spray our peas with soft soap and quassia if we can, and not to sow on the same spot the following year. So much for the estimable Board. But I believe I can mention something quite as efficacious against thrips as the spraying, and immeasurably better for the general health of the plants. Water at the roots. If by trench-sowing, mulching, and watering late peas can be kept moving freely they will succeed. If they can only make poor, pinched growth, owing to root dryness, they will fail, spraying or no spraying.

When Peter and I set out to prepare our ground for late peas it is understood on all hands that things are going to hum. We trench with no common trenching; we manure with no common manuring. This is how we go to work: Two spits are taken off and a dressing of manure is forked into the third; a coating is likewise laid on the top of it. The second spit is placed back, and likewise surmounted with a layer of manure. The top spit is left rough, and on two or three separate occasions in the winter is tumbled about and peppered with soot and burnt garden rubbish. House slops are poured on as opportunity offers. In February spinach and early turnips are sown. So thoroughly is the ground impregnated with fertile salts, that it will support quick growing crops like these without suffering exhaustion. When the peas are to be sown, shallow trenches are drawn, and a little decayed manure forked in. A man who cannot grow peas on this system cannot grow them at all. It gives wonderful results, not the least surprising being the fact that admittedly late sorts may be sown where in the ordinary way only earlies could be tried. For instance, none of our June-sown peas do better than Veitch's Perfection.

Peach culture is having a fair share of attention just now. What with Mr. Fish and Mr. Cook laying it on to each other vigorously, and Mr. Riddell giving us a solid article on general culture, we are having a gay time. I observe that the last-named indulges in a fling at the practice of growing vegetables on peach borders, the ground of his objection being injury to the surface roots. I wonder if he has ever seen Mr. Rivers' merry men at work repotting? They perpetrate atrocities on the roots which are calculated to make the casual visitor's hair rise as stout and stiff as the quills upon the fretful hedgehog which fell out of Mr. C. T. Druery's hands. And at every ejaculation of horror the reflective "T. F." quietly smiles. The surface roots are raked off in clusters. It looks barbarous, but it comes out all right. I think it quite likely that if more vegetables were grown on peach borders there would be fewer complaints of failure, for they would get stimulants which they do not receive now.

Fruit trees of various kinds will stand an immense amount of supposed maltreatment at the roots if they receive compensation in the form of food. Market men use the plough between raspberries regularly and get heavy crops, although many people contend that surface culture is fatal to the roots. For three years past we have taken a crop of early celery off one of our vine borders, and the vines are better than they ever were. They may suffer a little through the cultural operations employed in connection with the celery, but that is more than balanced by the benefit they derive from the various fluids which are applied to the other crop. Theoretically, no doubt, we are wrong, but if we get good celery and good grapes we are not without compensation.

I fear our respected friend "A. D." is a little put out. However, the subject is onions, and we expect a little warmth, even briny tears, in connection with this esculent. So acute are Mr. D.'s feelings about Ailsa Craig on the Surrey allotments that he is constrained to tell us about it twice in successive weeks in the MAGAZINE and once in another quarter. I hope he is now feeling better. Ailsa Craig is a very fine onion, and so is Cranston's Excelsior; but has anyone yet proved them to be good keepers when autumn-sown? It would be good news if they had. My experience is rather in the other direction, and I prefer Sutton's A 1 to either, although that even is not absolutely reliable. If "A. D." really wants to see the culture of Tripolis and Roccas abandoned by cottagers and growers generally let him persuade show committees to knock them out of schedules. Or let him induce judges to give up their preference for a ripe Rocca to an unripe Ailsa Craig in July or August. Most judges regard ripeness and "finish" as all-important with autumn-sown onions, and while they hold these views it is no use getting angry with the poor cottager.

LUX.

NOTES FROM EDINBURGH.

Calceolaria alba.

THIS is an old plant introduced from Chili more than fifty years ago, but almost lost to cultivation when lately re-introduced by Herr Max Leichtlin. It is a pretty perennial bush, with slender wiry stems and narrow linear leaves, that are two or more inches long, of a light green colour. The terminal erect panicles are about a foot long, the flowers being almost round and pure white. As a greenhouse decorative plant it is well adapted if due atttention is paid to pinching and a sturdy habit obtained. At Kew, this plant is said to grow to a height of five feet upon a wall, and if sufficiently hardy to withstand our climate, would form a most welcome addition to our shrubby herbaceous plants.

Episcia erythropus.

A plant of this is now in full flower here in the cool stove, associated with such plants as begonias. In habit it is dwarf, with long, arching, bright green leaves, the veins upon the under-surface being reddish in colour. The flowers are produced in great numbers in the axils of the leaves, the peduncles being about two inches long; the corolla is a pretty combination of pink and white, with yellow spots in the throat. This native of New Grenada thrives well in a compost of a light character, such as is usually in use for the order Gesneraceæ. It was introduced by the Messrs. Veitch a few years since.

Eucomis.

The members of this genus will be found most useful where a supply of plants for decorative purposes are in requisition. They are natives of the Cape and are said to be hardy in sheltered positions in the warmer parts of the kingdom; if planted rather deeply, and if in a rich soil, they grow very strong. For pot culture they are well adapted, throwing up from a rosette of long, spotted or striped foliage, tall spikes of flowers, from a foot to eighteen inches high. These are surmounted by a crown of small leaves, in the manner usual to pine-apples. The flowers are rather large, and of a greenish-white or yellow colour, and with purplish ovaries. Of the few species in cultivation, E. punctata, E. undulata, and E. regia, are perhaps the best known. Others are but seldom seen; all require a similar treatment, the principal factor of which is a very liberal amount of water during the growing period, and a season of rest during winter. They are all natives of South Africa, and are easily grown in a greenhouse from which frost is excluded.

Edinburgh. R. L. HARROW.

The Yellow Picotee.—The necessity for a more correct classification of the yellow-ground picotees was mentioned at the recent Midland Counties Exhibition. Mr. James Douglas made reasonable complaints that in the class for wire-edged yellow picotees flowers were awarded prizes which had streaky petals, and were not, therefore, wire-edged picotees; and he further stated that the time has come when some better classification should be taken in hand. Time was when there was a distinct section of wire-edged yellow-ground picotees, but they were, unhappily, so weak in constitution that it was with the greatest difficulty they could be induced to grow and bloom. They disappeared entirely, to be succeeded in later years by a new race of much stronger growth, and the group is multiplying with rapidity. But so many of the yellow picotees have small flakes and lines of colour along the petals that they cannot be classed as wire-edged picotees. Hence, then, the necessity for commencing a section of yellow-ground wire-edged picotees which shall bring them into line with the white-ground type. At the Midland Counties Carnation Show at Birmingham, there were classes for light wire-edge and heavy wire-edge picotees, but not a few of the blooms staged left something to be desired in the way of a greater concentration of colour on the petal edge only. The following were selected in the order of merit: Mrs. Douglas, Seraph, Mohican, and Ladas. To these may be added, as coming nearest to the type, Mrs. R. Sydenham, Mrs. Gooden, and Florrie Henwood. The heavy-edged varieties were Voltaire, Wanderer, and Eldorado. Taking the foregoing as illustrating the type, there is enough of material to commence with, and the sooner the attempt is made the better. If the committee of the National Carnation and Picotee Society hesitate to take this step, then the council of the Midland Society, which unites the northern and southern growers, may probably do so. The properties of the white-ground picotees should be required in the case of the yellow-grounds, excepting, of course, the tint of colour; and were this done, it would impart a great impetus to the production of new varieties. I hope that carnation exhibitors will ventilate the matter, especially as the Midland Society have originated distinct classes for light and heavy edge yellow picotees; and the contention of some at Birmingham was that flowers were admitted as edged yellow picotees which were not so in fact. The best time to discuss such a matter is immediately the carnation shows are over, and when the subject is likely to receive the greatest attention.—R. DEAN.

THE FRENCH TRUFFLE INDUSTRY.

THE truffle is such a curious plant that there is nothing extraordinary in its being enveloped in legends. It is simply a mushroom, developing in land at a depth varying from six to eight inches, and of a volume limited to the size of an ordinary apple or orange. Its origin has exercised the ingenuity of the ancient as well as of the modern worlds. Nicander alleged that truffles were formed from mud, modified by the earth's central heat, while Plutarch affirmed that their formation depended upon thunder. Phorphyry ranked them as children of the gods. Theophrastus laid down that the truffle was a vegetable raised from seed like other vegetables, while M. de Valsenes of our own days—two thousand years later—protests against that opinion. But no one denies the comestible value of the truffle, its delicate, almost strawberry perfume, and of its power—as Brillat-Savarin observed—to make ladies tender-hearted, and gentlemen amiable. In point of flavour, and delicacy of fragrance, the French Périgord truffle has no equal. It is really the queen of truffles, and made its first appearance in Paris towards the end of the fifteenth century. Its botanical name is Tuber melanosporum. Other parts of France cultivate truffles, and of different varieties; Italy raises many, and England not a few.

The truffle prefers a light soil, above all a calcareous one, and desires to be in proximity to oak or nut trees—it can also put up with beech and birch—and develops within the range of their rootlets. It does not like a too humid situation, nor a rich soil, nor a greater altitude than six hundred yards above the sea; a northern aspect is objectionable. A humid spring, followed by a warm, stormy, and dry summer, constitutes its ideal. No ailimentary substance suffers more readily from atmospheric variations than do truffles. The truffle heats or freezes quickly, and hence decomposes. It is also eccentric, for it delights to develop slowly away from other plants. In spring it is but the size of a small cherry, soft, and devoid of fragrance; in summer the tissue becomes more firm, grey veins set in, and the aroma arrives; by November or December, it possesses all its most valuable perfume. Towards the end of winter it turns black, parts with all its qualities, and decomposes. Heat also causes the truffle to lose its aroma and consistence. The Périgord truffle can be recognised by its brownish black or violet flesh, traversed by several white veins, shining and bordered with red; and its delicate perfume and agreeable flavour.

There are pigs and dogs that are employed to discover and unearth truffles; the pig—a sow especially, because much more intelligible—is preferred, it can also dig down deeper into the hardest soil, while a dog soon becomes tired of scratching the soil and bringing nothing to light, so leaves the work for the master to finish. Both dogs and pigs are carefully trained for truffle hunting in France. The peasant—a man or a young woman—sets off in the morning with the animal, which soon finds out the truffle bed by the perfume emitted. The peasant has a bag into which the truffles are dropped, and this has a side pocket containing small pieces of chese, bread, or glands, with which to reward the dog or pig as soon as a "black diamond" is discovered. Often squirrels are about the spot, for they also like the dainty esculent.

The peasant has a staff tipped with iron to dig out the exposed find. The sow being more docile, and possessing a finer nose or snout, can scent a concealed truffle forty yards away. Scenting the esculent, it makes direct for it, inserts her snout into the ground, and soon uncovers the prize. That done, the animal awaits its reward, generally an acorn or a piece of cheese. The pig commences to hunt for truffles when two years old, is in its prime at four years, and can continue that natural calling till aged twenty-five. A good pig has been known to indicate 40 lbs. weight of truffles in a rooting day, however, 12 lbs. weight forms the average of a good day's work. The kind of dog preferred to hunt up truffles as its game, is of small breed; it barks with delight whenever a fine truffle is laid bare and feels sad if the day is not lucrative. It occasionally happens that a "nugget truffle" is discovered weighing eight to sixteen ounces. The truffles are next sorted out into three sizes by being passed through osier sieves; often the classification is merely made by hand. The town of Apt, in the department of the Vancluse, is the great French market for truffles; the peasants bring there every Saturday morning during the season—which commences in November—a week's gathering, never in baskets, but in sacks or rolled up in cloths. The wholesale dealers in preserves arrive—from Carpentras especially—to purchase supplies and take away the produce in carts. After the local industries have been supplied, the exportation of truffles commences. Vancluse sells annually over four million francs' worth. A good deal of adulteration is practised in the industry, independent of mixings from the twenty varieties cultivated or sold. For instance, they are coated with earth to appear large, again, small and big ones are often pinned together. Frozen truffles are thawed, coated with earth, and bits of lead or stone included to add to their weight. Tubers are sold made of parings of true truffles, after being mixed with earth and moulded. Occasionally potatos are utilized, mere scraps of truffles added, and the mass covered over with brown earth.

The alimentary value of the truffle is very great, though doctors differ respecting its digestibility, but the latter can vary with individual temperament. Gouty persons ought to avoid truffles. During the cholera plague in Paris, in 1849, the physicians utilised decoctions and solutions of truffles. They were even made into snuff to combat retchings and diarrhœa. Analysis shows that there is much kinship in the composition of bed mushrooms and truffles. The latter contain seventy per cent. of water, cellulose, odoriferous principle, some volatile oil likely, acids, and salts; the truffle is rich in nitrogen, and contains phosphorous, potash, lime, iron, and sulphur. The percentage of these ingredients is high, even when their presence in the soil is very rare. The average wholesale price of truffles is 6 fr. to 13 fr. the kilogramme (2¼ lb.), but trays of first quality truffles have fetched 20 fr. a pound, and were sold without any difficulty. These are only the variety known as Tuber melanosporum, and raised in Dordogne. The total annual produce of truffles in France is estimated at 17,000 tons, representing a value of 21 million francs, and nine-tenths of the Périgord output are consumed in France, either in the fresh or preserved state; England and Belgium take the remainder. France imports a large quantity of truffles from Italy—which are the best after her own—and prepares them extensively for the English market.

Can truffières, or artificial truffle beds, be created? is a question of some interest. The answer is yes, and such exist in many places. The Agricultural Society of the Department of the Lot awards prizes at its shows to truffle growers. In the Vancluse, where the cultivation is extensive, 450 tons are annually exported. Waste and neglected lands have been successfully utilised in the cultivation of truffles, and the price of such land is now 4,000 fr. per acre. The Departments of the Lower Alps and the Lot produce 350 tons; Dordogne and the Drôme, 300 tons. Indeed, fifty-one out of the eighty-nine Departments now raise truffles. Of course, the quality varies with locality, so truffles are divided into three commercial categories; the first from Périgord, Angoumois, and Piedmont, the last from Normandy and the Seine.

In Dordogne and Ladouze, the Mayor, M. Maligne, lost the vines on his estate of two hundred acres from the phylloxera. He converted his land into a truffiere, and with great success. The average net profit of an acre of tubers is said to be 450 fr. The beds last for twenty-five or thirty years, or for ever, if attention be paid to the oaks; the culture exacts no manure, no labour. Truffles kill off all vegetation; when the latter shows it is a sure sign that the truffle bed is worn out. In the Vancluse, the two year old oaks—the white variety is the best—are planted one hundred and twenty inches asunder, and double that distance between the rows; or, the acorns can be sown in spring and the plants thinned out later. The truffle grows at the roots of several species of trees, but chiefly the white and green oak. The soil ought to be calcareous, somewhat sandy, porous, rich in humus, resting on a shallow permeable subsoil of stones and humus. Five years after the oaks are planted, the truffles will appear, and be recognized by the disappearance of all vegetation or weeds; they first show close to the trunks, and then extend laterally, so as to be always in touch with the range of the outspreading roots. The oaks ought to be pruned to resemble an inverted sugar loaf, for truffles must have plenty of air as well as light. Spores which fall on the soil produces the mycelium, or white threads known as spawn, and growers in addition scatter some earth from existing truffle grounds over the new beds; parings of truffles are also strewn. Truffles are gathered at various periods; for instance, the Perigord, from October to April; the summer varieties, from May till July; and the others from October to December.

EDWARD CONNER.

NEW TRAILING ROSES.

ROSA LUCIÆ—R. Wichuraiana of American gardens—is already becoming popular in this country for covering ground, for rooteries, &c., and some of the hybrids of which it has been one parent have been exhibited in London, one, Manda's Triumph, having been figured in our columns. Mr. W. A. Manda, who resides in South Orange, New Jersey, U.S.A., has been working with the popular very hardy trailing or climbing R. Wichuraiana as a seed parent since he started for himself at South Orange, and his set of hybrids sent out two years ago have had a deserved and wide popularity, but, says a correspondent to *Gardening* (Chicago), it is pre-eminently under the raiser's care that the merits of these beautiful creations can best be seen. He has tested them in every conceivable way, on dry hill sides, in the shade, their roots exposed to the winter, and Mr. Robert M. Gray forced a set of them at Julius Roehrs', and found them as free flowering as Crimson Rambler. With their fast multiplying colours and extreme floriferousness, their ease of propagation and consequent greater cheapness, it seems to me this class of roses are likely to run the azalea a hard race for the first place as florists' Easter flowers.

The new evergreen set are even more vigorous, but will not probably be in the hands of the trade before next year. Many of you may, however, wish to know what they are like. They are R. Wichuraiana crossed with Perle des Jardins, Meteor, American Beauty, and other forcing roses. To Mr. Manda's surprise, I daresay, they retained their foliage outdoors last winter. They are most luxuriant growers, evidently hardy, and worthy of the most extended trial wherever covering plants are desired. To my mind the most beautiful are two crosses of the Perle, Gardenæflora, with beautiful yellow buds, and expanded flowers like Gardenia Fortunei, and Jersey Beauty, a single white flower expanding to three inches across, with big clusters of golden yellow stamens studded over beautiful masses of rich and shining green foliage; it will take the place of the Cherokee rose northward. Evergreen Gem is another dense grower of this set, and besides these are several as yet unnamed, such as a cross of Meteor with fine, full, double, light pink flowers. The Beauty crosses had scarcely arrived at a condition for me to talk about, but I would say to florists that they should watch these roses, for I believe they will prove to be among the most useful acquisitions for a wide section of country that we have seen in recent years, and for the class of customers who desire roses for training on walls, or covering bare ground, they should prove of great value.

Parsnips.—In a large competition with these roots at the Shrewsbury show recently, Mr. R. Tye seemed to be the only exhibitor of that new selection, and evidently a very excellent one, known as Sutton's Tender and True. Generally in all the classes in the show the roots were far too long, and not relatively clothed with flesh. The ideal parsnip with so many persons seems to be found in plenty of bone, but very little marrow. In the parsnip, however, the marrow is looked for outside, rather than within the bone. Many roots ranged from two feet to two and a-half feet in length, and but about nine inches of the whole were edible. The Tender and True, however, is less long and relatively much more fleshed. The roots staged were very handsome, smooth and white, had shoulders almost as rounded and tapering to stoutness lower down, as beets usually show. That is not at all a characteristic of the old Hollow Crown variety, which is the one usually grown for exhibition. Mr. Fyfe, of Lockinge Park, showed Tender and True last year and easily took first place with it.—A. D.

ECONOMIC PLANTS OF CENTRAL AFRICA.

THE annual report on the British Central Africa Protectorate just issued by the Foreign Office, contains some interesting notes on the exotic economic trees and shrubs cultivated in the Residency Ground, Zomba, by the Government Botanist (Mr. J. Mabon), who says: The collection of exotic plants grown at Zomba possessing economic value is not at present very extensive, but it is being steadily added to. The Coffee-disease Regulations in force prevent plants or seeds being imported from several tropical centres where we could obtain many valuable things, and the long journey from England hinders us from obtaining plants in Wardian cases from the Kew establishment or any of the large nurseries, except the consignment is taken in hand by some officer of the Protectorate, or the like, who is making the voyage out and sees it safely through. The authorities at Kew, having such unusual opportunities for distributing seeds, frequently forward valuable material to us, and many of the items mentioned in the accompanying list emanated from Kew, either as seeds or plants. The list as it stands forms an interesting record of the cultural possibilities in the climate of the Shiré Highlands. There are but few countries where one can see such an essentially cool and northern type of vegetation as Lawson's cypress (which bears seeds in enormous quantities) growing alongside such an essentially tropical type as the gutta percha of Malaya (*Dichopsis gutta*). Although it is true the latter does not reach its proper degree of development, yet it is perfectly healthy, and it points to the fact that in the lower and warmer region on the Shiré River it would be a valuable culture.

Many of the items mentioned are only represented by one plant, and many of them are not old enough to have reached the fruiting period. Some of the introductions grow with surprising vigour. For instance, eucalyptus, the seeds of which were sown about six years ago, are now over sixty feet high, and would yield very capable timber if required. The well-known blue gum (*Eucalyptus globulus*) is not, however, a success here, but it seldom is in these latitudes below the 5,000 feet level. Still there remains numerous equally good, and even better, members of this useful genus which we can cultivate with success. Mauritius hemp (*Furcræa gigantea*) and sisal hemp (*Agave rigida var. sisalana*) grow with great freedom, and while it would scarcely pay to cultivate these valuable fibres at present for the European market, yet if any textile industries arise locally there can soon be plenty of raw material at hand to supply them. Seeds of the celebrated China grass (*Boehmeria nivea*), a fibre very much in demand now, have been ordered, and it is intended to demontrate that it is a profitable culture that might be grown in Nyassaland with the object of exportation to the European markets. Arnatto (*Bixa orellana*) fruits with great profusion; the seeds are used in the arts as a dye and as colouring agent for butter; the supply at present, however, from colonies like the West African, exceeds the demand.

Fruits are of a very important culture in all tropical countries, and the indications point to the Shire Highlands being suitable for raising the fruits of many diverse countries. The mango (Mangifera indica) grows with much luxuriance, but as all the existing plants at Zomba have been introduced recently they have not yet reached the fruiting stage. One tree is expected to yield some fruit this year. The same applies to oranges, avocado pear, and guavas, although at present one tree of the latter is maturing fruits. (On the Buchanan Estate, close to the residency, oranges bear with great profusion, and up till recently peaches were a great success there.) The granadilla (Passiflora quadrangularis) fruits freely, and the fig (Fircus Carica) seems quite at home. The grape vine grows well, and is a recent introduction; we expect to see it fruiting next year. Bananas, it need hardly be remarked, bear with great abundance. Up to the present this is practically the only fruit the native grows.

Exotic timber trees are very promising. The red cedar (*Juniperus virginiana*) and West India cedar (*Cedrela odorata*) do extremely well, and are important in view of the expected development of the tobacco industry, as they supply material from which first-rate cigar boxes can be manufactnred. Kauri pine (*Dammara australis*), a timber of great value and utility, promises to become a great success here, for seedlings planted a year ago have reached over three feet in height. Mahogany does very well. The good offices of Kew have been requested in obtaining for us a large quantity of seeds in order that we can grow it on a considerable scale and distribute it over the Protectorate. The splendid Mlanje cedar (*Widdringtonia Whytei*) grows with unexampled vigour at Zomba, which is at least 3,000 feet lower than its native habitat. It is very interesting to find it doing so well here, and points to the fact that in time the hills of Nyassaland above the 3,000 feet level can be successfully forested with this excellent timber. Seeds from the trees at Mlanje have been widely distributed among Government officers, missionaries, and planters in the Protectorate, as well as to various parts of Southern Africa.

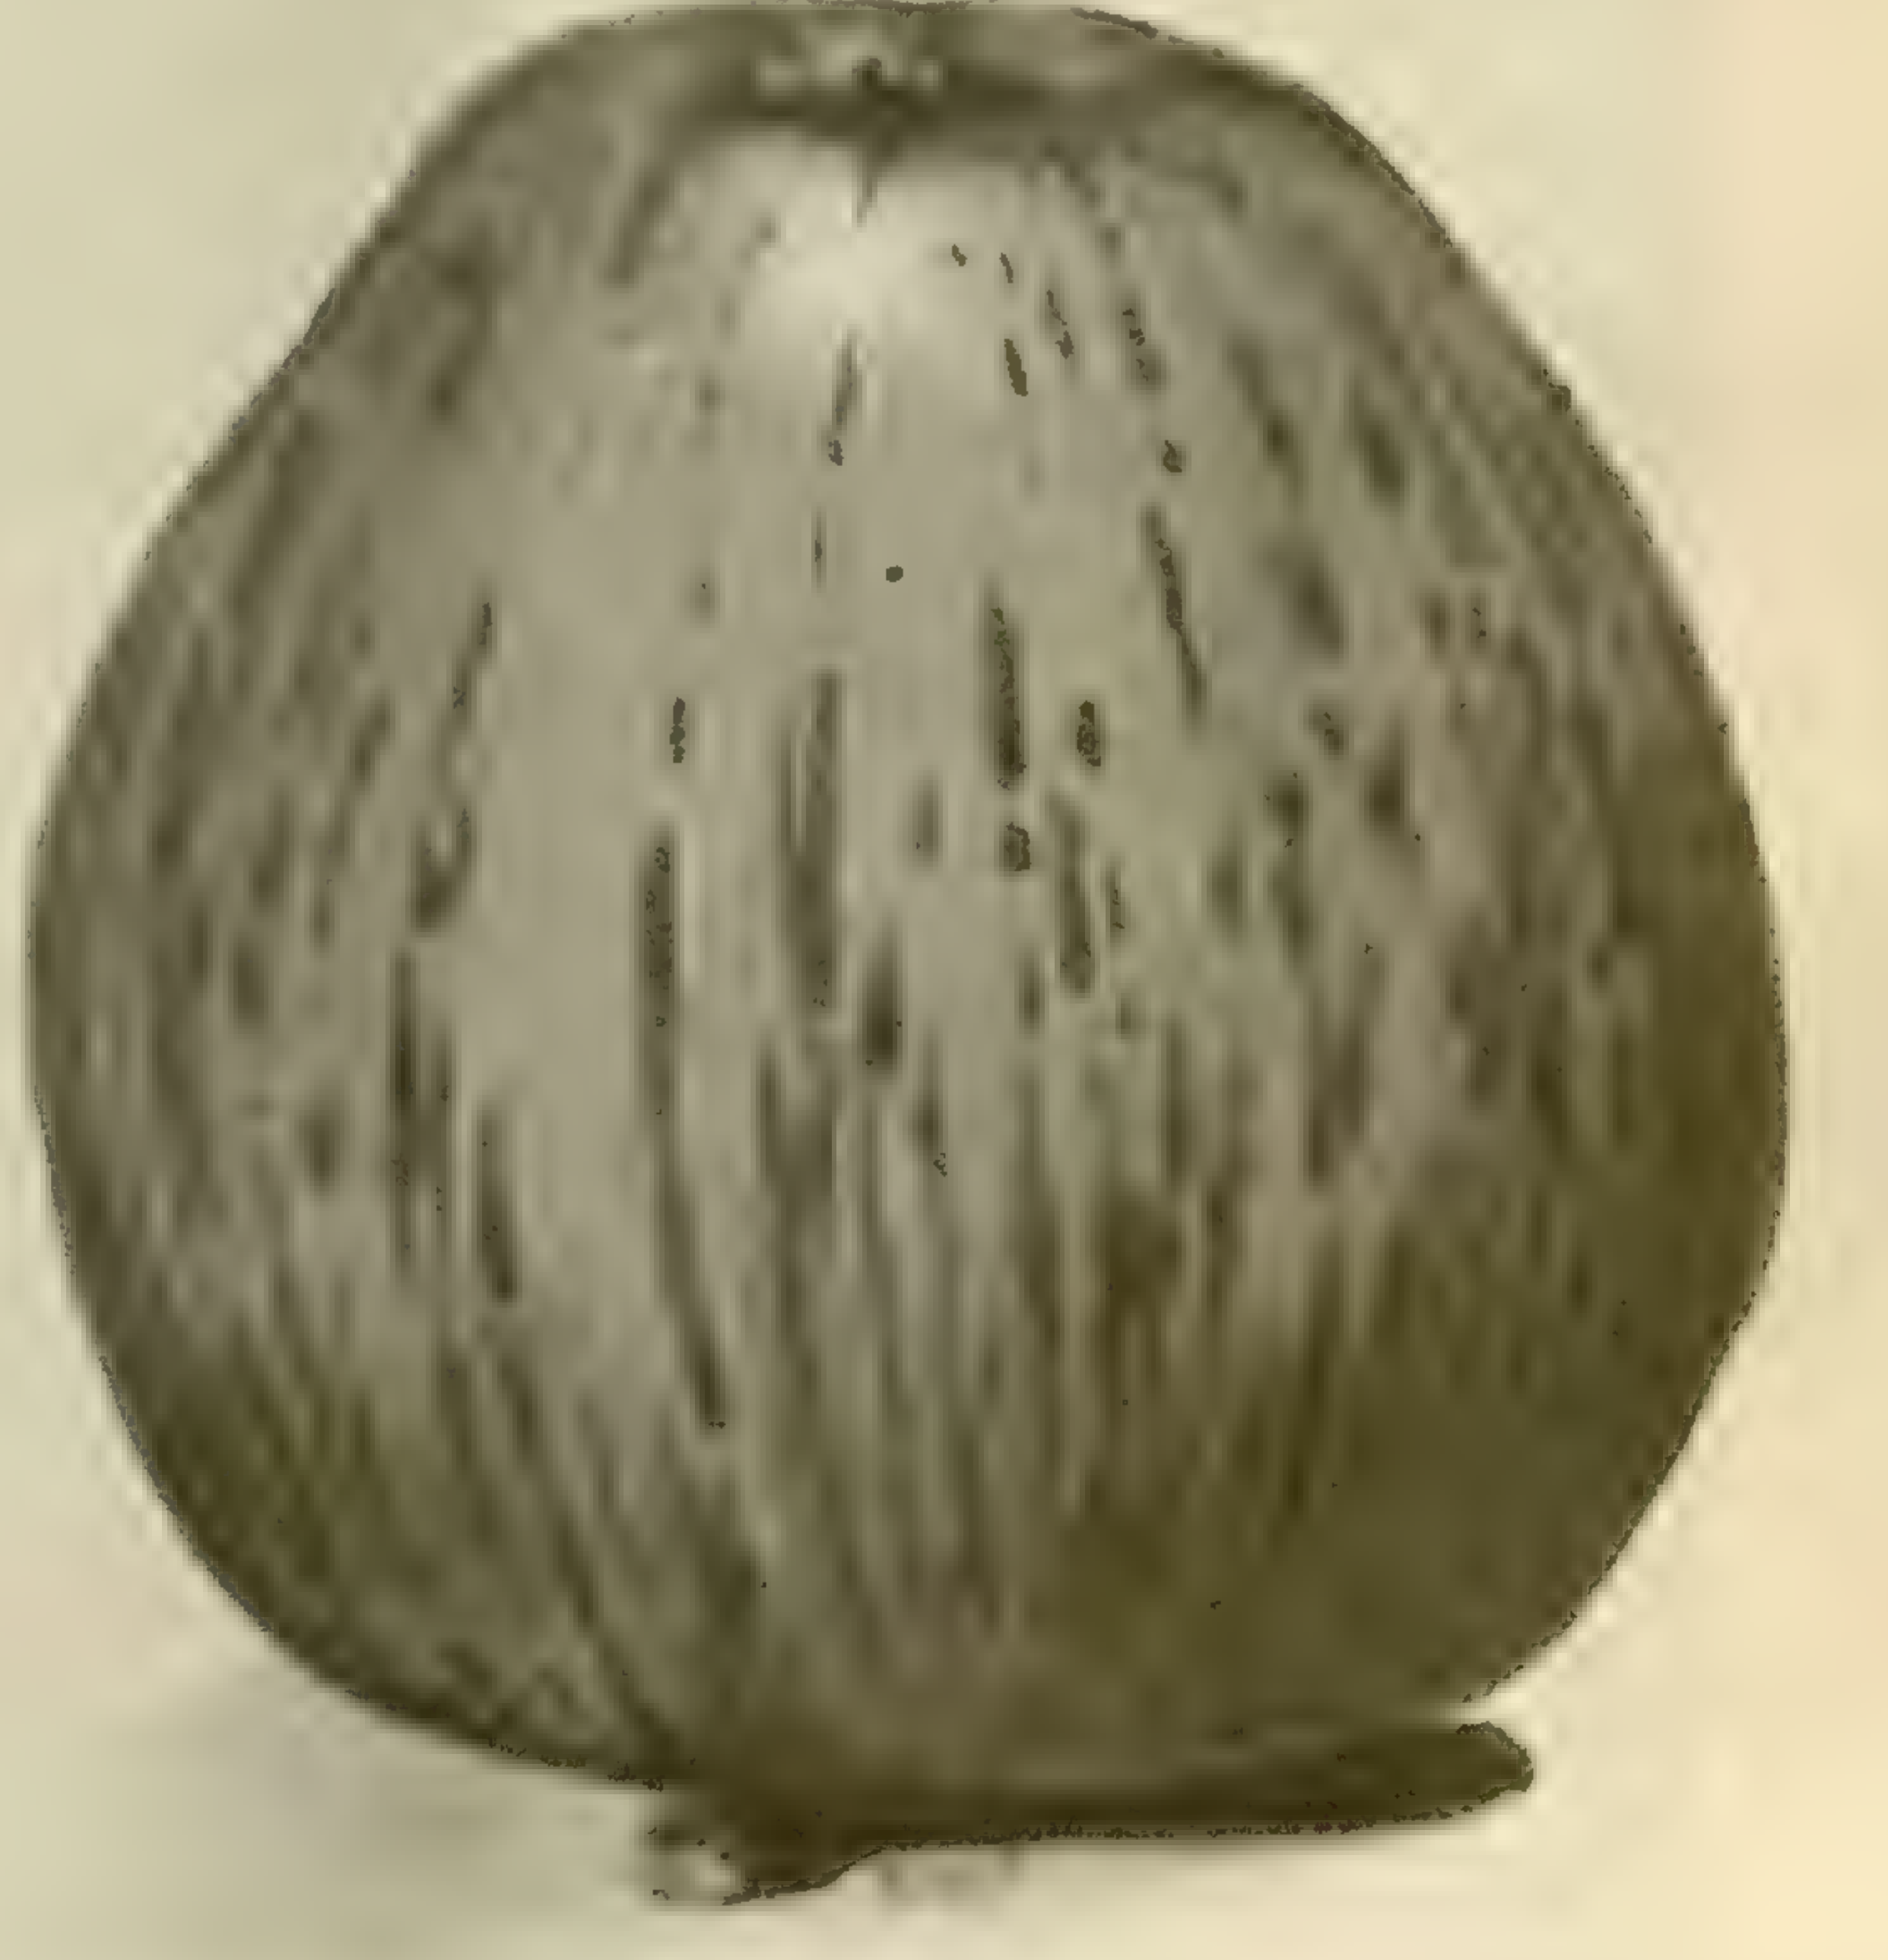
NOTES FROM THE CAPE.

In a letter, dated the end of July, just received from a correspondent who is travelling at the Cape for the benefit of his health, the following remarks, which will be of interest to horticulturists, occur: "The scenery of Durban and the locality is magnificent, and I can imagine none more beautiful in the world. The flora, too, is grand. The begonias average five feet in height and the bougainvilleas twenty feet, and in bloom all the year round, the latter being one glorious mass of purple. Coleus and many extraordinary foliage plants and ferns exist in apparently endless variety. The common canna is a weed, and all the latest florists' varieties flourish and are very popular here. Then just now (the end of July) the citrus family is in full fruit, and at early morning time the air is sweet with the scent of ripe oranges, to be replaced shortly by the orange blossoms. Oranges are now falling off the trees in thousands and rotting on the ground. Then there are the sweet lemons, naartjes, limes, and lemons. The sweet lemon is unknown in England. It is somewhat larger than the ordinary lemon—the same shape, but the colour is orange, and the flavour that of a lemon with all the sourness eliminated. The naartje is the Tangerine orange. The mango is in flower, and the glowing blossoms of the hibiscus are to be seen in every garden. Roses, too, are plentiful, and if one wishes to make a bouquet one has but to walk a few yards, and Asparagus plumosus nanus can be found growing wild. Pine-apples are almost as cheap as oranges in England, and bananas are ten a penny. Altogether it is a beautiful country for flowers and fruit, but the terrible humid heat tells on all with weak chests unmercifully. Though a little tco hot in the day, it is cool at night, and it is not desirable to be out after five o'clock, by which hour it is pitch dark. Yet in the early morning you will see people with blue noses rubbing their hands to keep them warm."

WM. NORMAN BROWN, F.R.H.S.

NEW DESSERT APPLE, LANGLEY PIPPIN.

DESSERT apples are so highly appreciated by a large section of the community towards the end of the summer that varieties ripening during August and September are of special value, and any important addition to the somewhat meagre list of early apples is assured a hearty welcome. Therefore it is not surprising the fine variety presented to public notice by Messrs. J. Veitch and Sons at the second of the two August meetings of the Royal Horticultural Society under the name of Langley Pippin should have created much interest and obtained recognition from the Fruit Committee. This vatiety, as recorded in the issue of the GARDENERS' MAGAZINE of the 27th ult., originated from a cross between Cox's Orange Pippin and Mr. Gladstone, and it is of interest to add to the information given on page 554 that the former was the pollen and the latter the seed-parent, and, further, that the influence of the pollen-parent is strikingly manifest. The fruit is of medium size, as indicated by the accompanying illustration, roundish, inclining to conical, the skin pale yellow, brighter on the side next the sun, where there is a highly-coloured cheek composed of scarlet streaks and crimson mottlings; the eye is open, with long segments set in a shallow and slightly plaited depression; the stalk short and fleshy and obliquely inserted in a slight cavity. The flesh is whitish, tender, and with a pleasant crisp flavour



APPLE, LANGLEY PIPPIN.

The fruit has probably ripened this year under the influence of the recent hot weather, rather earlier than it otherwise would have done; but whether this be the case or not the variety is unquestionably a valuable addition to the early dessert apples, for it combines productiveness with its other good qualities.

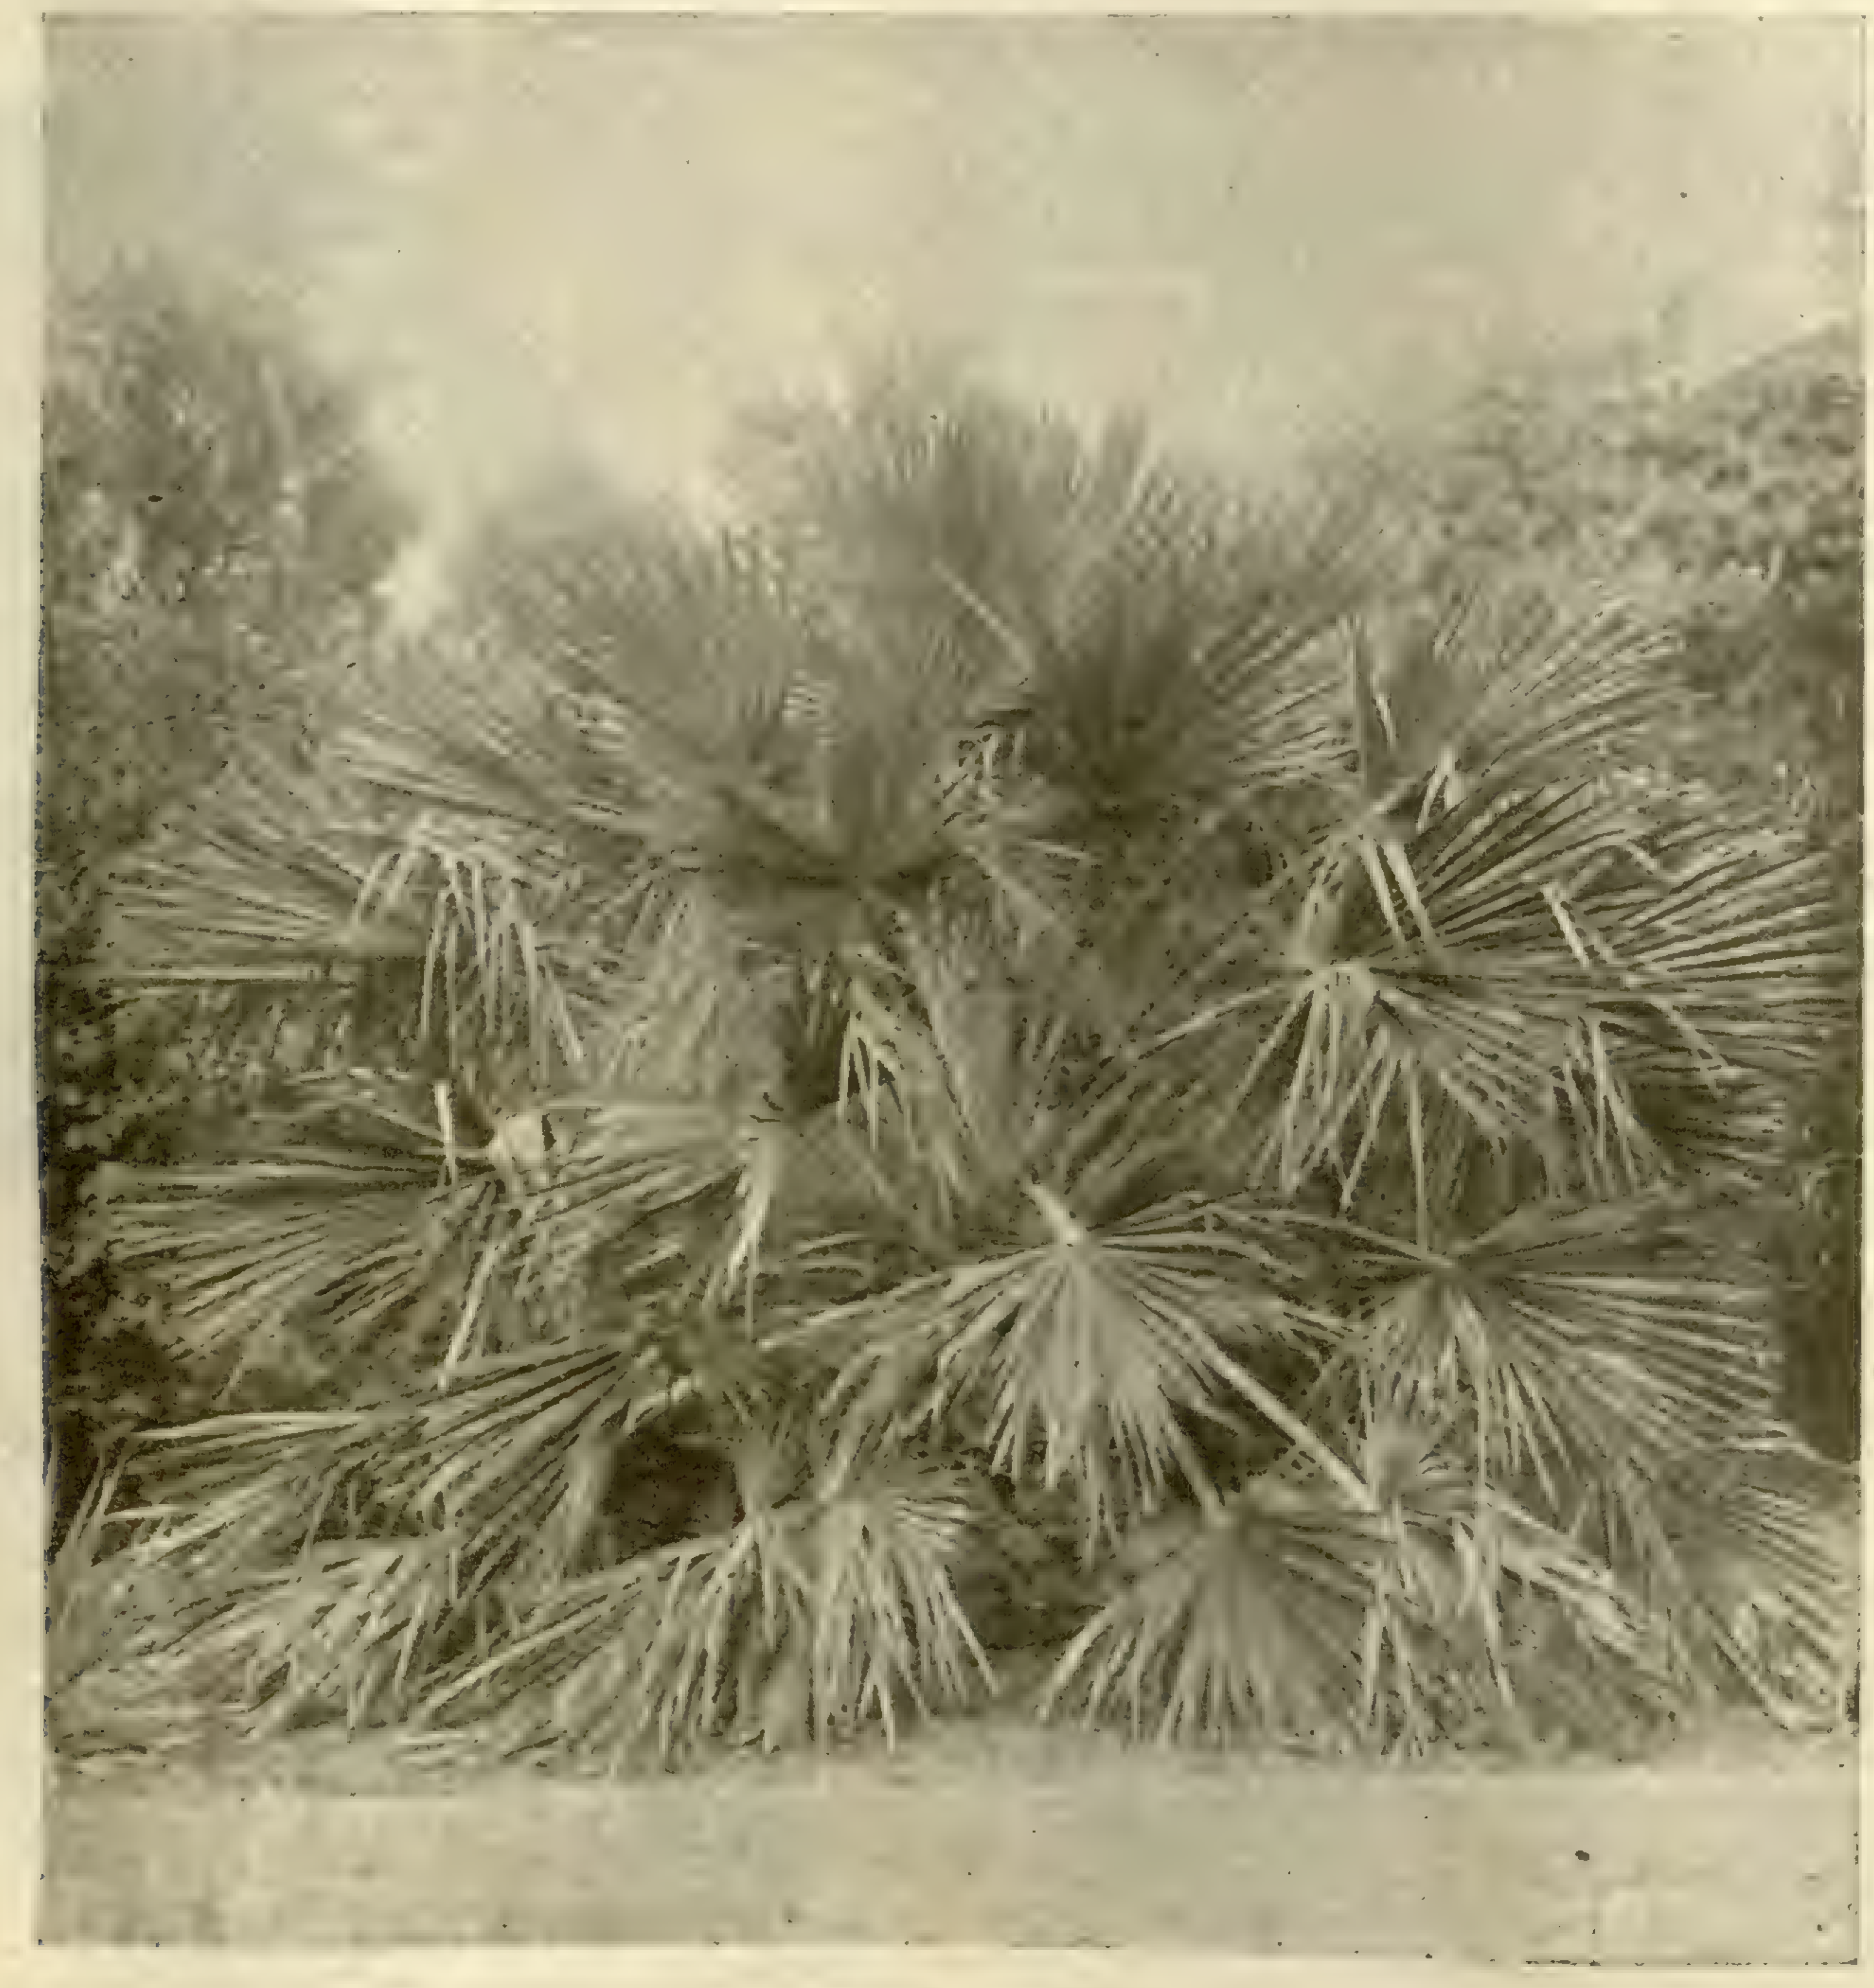
Cross Fertilisation of Fruits.—Cross fertilisation is effected, as every gardener knows, by the action of the pollen of one plant upon the stigma of another. The nature of this action is, said Mr. J. Cranmer, in an address to the Irish Gardeners' Association, highly curious. Pollen consists of minute hollow balls or bodies; their cavity is filled with fluid, in which swim particles of a figure varying from spherical to oblong and having an apparently spontaneous motion. The stigma is composed of a very lax tissue, the intercellular passage of which has a greater diameter than the moving particles of the pollen. When a grain of pollen comes in contact with the stigma it bursts and discharges its contents among the lax tissue upon which it has fallen. The moving particles descend through the tissue of the style until one or more of them finds its way, by routes specially designed by Nature for this service, unto a little opening in the integuments of the ovulum, or young seed. Once deposited there the particles swell, increase gradually in size, separate into radical and cotyledons, and finally become the embryo, that part which is to give birth, when the seed is sown, to a new individual. Such being the mode in which the pollen influences the stigma, and subsequently the seed, a practical consequence of greater importance necessarily follows, viz., that in all cases of cross fertilisation the new variety will take chiefly after its pollen or male parent, and that at the same time it will acquire some of the peculiarities of the seed parent; thus, in Coe's Golden Drop plum, the pollen parent was the yellow Magnum Bonum, the seed parent the Greengage. The limits within which experiments of this kind must be confined are, however, narrow. It seems that cross fertilisation will not at all, or very rarely, occur between different species, unless these species are nearly related to each other. We have no hybrids raised between the apple and the pear, or the quince and the pear, or the plum and cherry, or the gooseberry and currant. On the other hand, new varieties, obtained by the intermixture of two pre-existing varieties, are not less prolific, but, on the contrary, often more so than either. It is, therefore, to the combination of the most valuable existing varieties of fruit that gardeners should trust for the improvement of their stock. By this operation the pears that are ripe in spring have been rendered as delicious and as fertile as those of the autumn. There is no kind of fruit, however delicious, that may not be deteriorated, or however worthless that may not be ameliorated, by particular modes of management; so that, after a given variety shall have been created, its merits may still be either elicited or destroyed by the cultivator.

ERYTHEA EDULIS.

Among the numerous handsome fan-leaved palms, the members of the genus Erythea take a foremost place for their beauty; only one species, however, is at all frequently met with under cultivation in European gardens, viz., Erythea edulis, also known as Brahea edulis. The genus is confined to Southern California, and the species figured in the present issue is a native of the island of Guadalupe. In this country E. edulis can be successfully cultivated in a greenhouse or warm conservatory, and when it has attained some size the large, plicate, filiferous leaves are especially handsome and greatly admired. The sheaths, and also the inflorescence are peculiarly and distinctly tomentose. Under the influence of the genial South Californian climate, this palm attains a height of fully thirty feet, with an elegant trunk from a foot to eighteen inches in diameter. When a specimen has attained a flowering size, it blooms regularly each year towards the end of March, the somewhat insignificant flowers being scattered along the branches of a large drooping panicle. Clusters of ripe fruit have been known to weigh fifty pounds.

The generic title is a fanciful one, and adapted from Grecian mythology, for Erythea was one of the Hesperides who guarded the garden of golden apples in the west. The application was, however, a good one, for California is always associated in one's mind with gold, and during later years it has, indeed, become a garden of golden fruit—oranges, lemons and apples. The specific title refers to the edible character of the fruit. This palm has now become quite acclimatized in the south of France and all along the Riviera. Our illustration represents a specimen in the garden of M. Hippolyte Dellor, at Hyères; it stands about twelve feet high, and has a trunk over thirty inches in diameter at the base. The largest fronds stand out horizontally from the trunk, and are some three-and-a-half to four feet long, and about a yard across. This specimen was planted out in 1886.

Wild Flowers and their Colouring.—Taking the natural order of the Compositæ, it will be found that out of forty-five different species twenty-five are yellow, nine are purple, six are white, and two are blue, of our wild flowers, these last being the chicory and cornflower. In the next largest order, the Umbelliferæ, out of thirty-six species twenty-four are white, three are yellow, one is blue, and the remainder are greenish or pinky-white. In the Cruciferæ, out of twenty-six species fourteen are white, seven are yellow, one is yellow, and one white and yellow. Dyer's Wood, now very seldom found, is yellow. In the Labiatæ the colours vary very much—white Dead Nettle, yellow Archangel, lilac mints, purple thyme and betony, rose Hemp Nettle, blue Skull-cap, and violet Prunella or Self-heal. In the Rosaceæ will be found white, yellow, pink, rose, red, purple, and green—only one, the Isnardia, having this last colour. In the Leguminosæ there is considerable variety, including yellow, purple, white, rose, and pink. Summing up, it might be said that spring paints the fields and hedgerows with yellow, blue, and white; summer, with yellow and pink; and autumn, with purple, scarlet, and gold.—W. N. B.



ERYTHEA EDULIS.

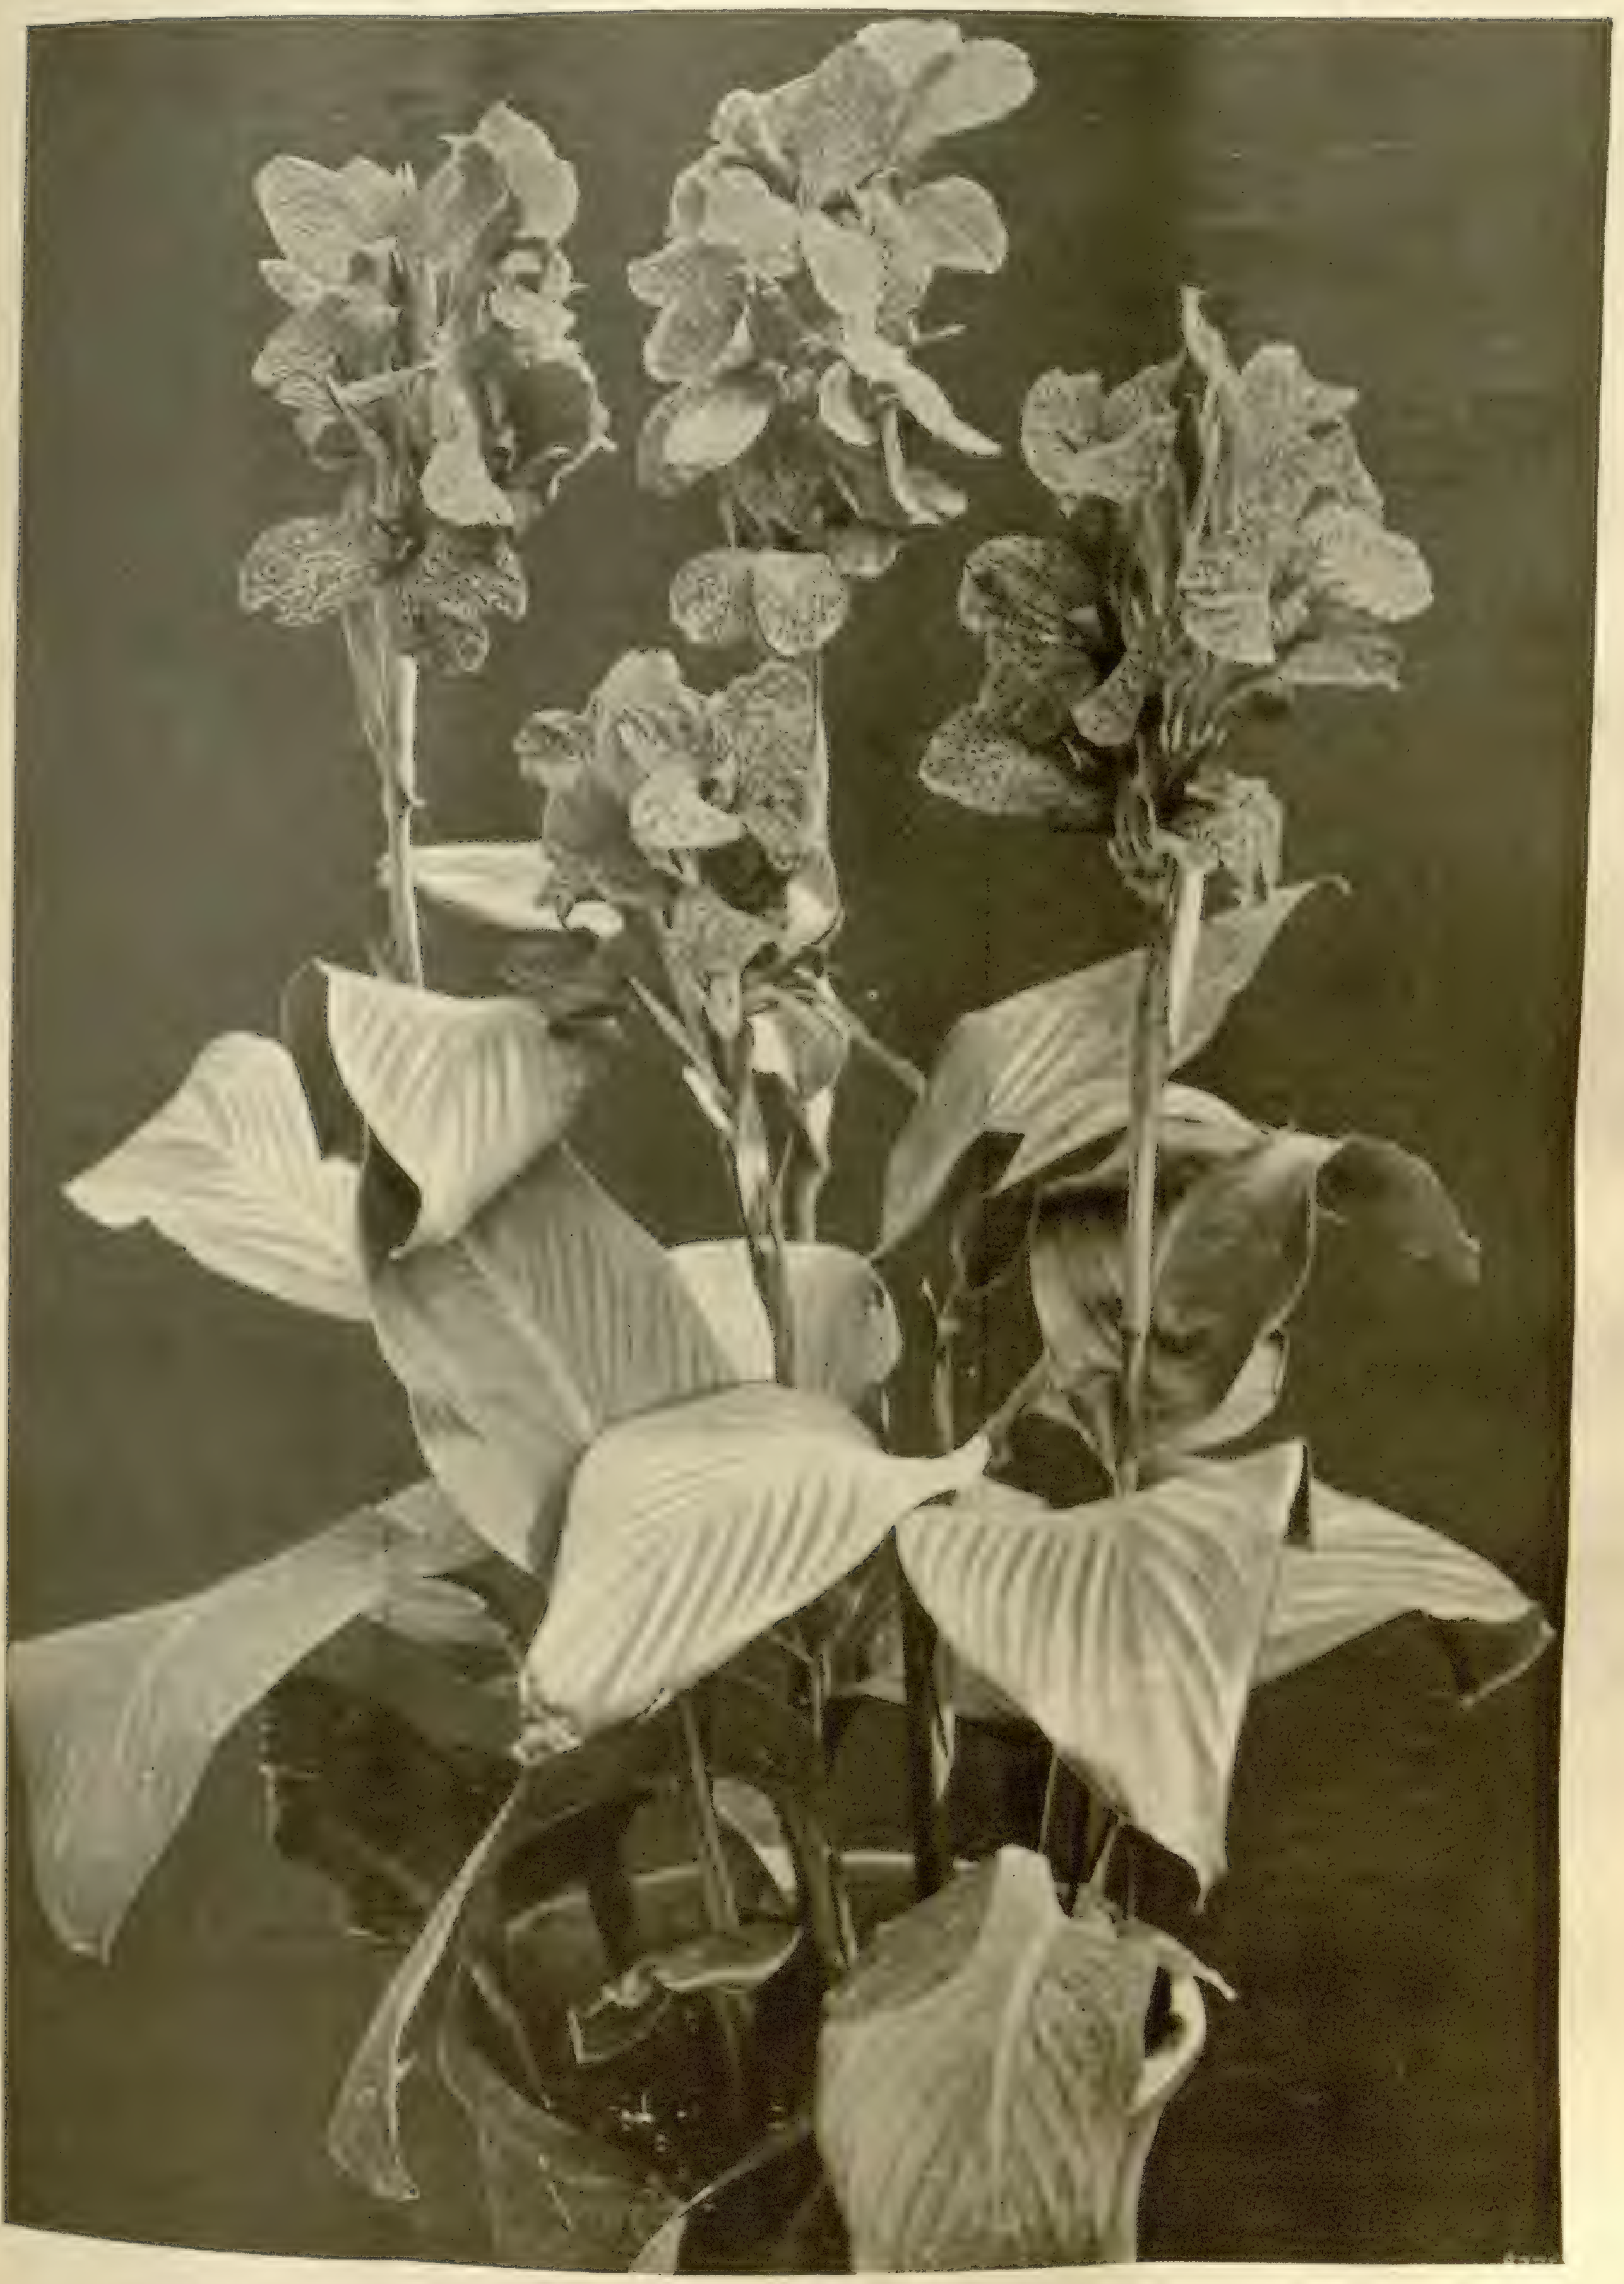
CANNAS AT CHISWICK.

The large flowering cannas have now thoroughly taken up a position in the round of subjects that a horticulturist of any pretensions cultivates for the decoration of the home, the conservatory, or the greenhouse. The large number of varieties that have of late been raised and introduced can readily be divided into two groups, one remarkable for dwarf habit, compact spikes and brilliant flowers, and known as the Crozy cannas; and the other set conspicuous for their strong growth, bold, handsome foliage, and long spikes of exceptionally large flowers that have a vivid colouring, very broad rounded segments—reminding one of the Kæmpfer iris—but rather more fugitive than the dwarfer set. This set is now recognised as the Italia group, as Italia was the first of the series sent out by Messrs. Dammann and Co., Naples.

Those who contemplate adding a few more varieties to those they already possess, or who intend to commence the cultivation of cannas at the earliest opportunity, should, if possible, view the collection in the gardens of the Royal Horticultural Society at Chiswick. Here there are about ninety varieties, besides a goodly number of unnamed seedlings raised in the establishment; almost all the named sorts are represented by two specimens carrying from three to eight or ten growths each, so that there is a fine display, which does credit to the superintendent, Mr. S. T. Wright, and his able assistants. These large specimens are mostly growing in ten or twelve inch pots, and it is noteworthy that they have been potted low, with ample space between the surface of the soil and the top of the pot to allow of an abundant supply of water, stimulants, or top-dressing, as necessary. The structure is an airy greenhouse, but, of course, the plants are kept warmer and the atmosphere more moist when growth commences than now. All varieties are subjected to precisely the same treatment, and there is no coddling, consequently the differences of height and habit are easily recognised, as also are the colours of flowers and foliage. The leafage is very diverse when a little close inspection is made; some leaves are almost erect and pointed, others are rounder, broader, and more horizontal. Some are deep purple in colour, others are purple with green stripes; some are dull green, and others pale green or glaucous green; then, also, there is a distinct margin to the leaves of some sorts, this being whitish-green in some instances and dark purple in others. The height also varies, from two and a-half feet up to six feet, so that there is plenty of variety to suit all tastes. A good selection is as follows:

Mrs. Fairman Rogers is a beautiful variety, dwarf in habit, and with medium-sized green leaves. The spike is most compact, and composed of handsome, broad-segmented flowers, four segments being almost equally developed, so that a quite rounded flower is produced. The colour is rich rosy-scarlet, heavily shaded and suffused with bright scarlet. There is a picotee edge of gold and yellow markings at the base.

Stadtrath Heinrich has very large purplish stems and foliage; the



CANNA COMTESSE DE VARTOUX FLORENCE. (Flowers bright yellow, spotted with scarlet.)

spikes are much branched, and the broad-segmented, full flowers are of a rich crimson-scarlet colour.

Koningen Charlotte cannot be omitted, for it is very dwarf in habit, and produces substantial spikes of exceedingly brilliant flowers that have a large, irregular, vivid blood-red central area to its yellow segments. Very many persons consider this variety to be too crudely coloured, and certainly the combination is more brilliant than beautiful.

Madame Crozy continues to be one of the best of cannas, both by reason of its dwarf habit and its vivid blood-red flowers. Sometimes this colour extends over the whole of the broad and rounded segments, but sometimes there is a wire-edge of bright yellow, while the base of the segment is shaded or spotted with yellow.

L. E. Bally is particularly telling; it has pale green leafage, and grows about three and a-half feet high. The spike is good, and the flowers stand out well upon it; the segments are moderately broad, clear, and soft golden yellow, profusely spotted with dull scarlet. A very fine canna.

Hofgartendirector Lauche is a bold variety with shorter and broader foliage than most; it is from three to three and a-half feet high, and has fine sturdy spikes of orange-scarlet flowers, these segments being margined with yellow and spotted at the base with yellow; the latter colour extending to the extreme base of the segment.

Hofgartendirector Wendland is a somewhat small-leaved, green foliaged variety, very free, and of medium height; the spikes are large, and as the centre spike fades, side ones push out so that a display is continued over a long period. The blooms are nearly five inches across, fairly substantial, of a brilliant vermilion-scarlet hue with an irregular golden margin, and golden markings at the bases of the segments.

Tuevia grows about four feet high, and has clear green foliage. The flowering stem is tall, and carries very large blooms, with drooping and somewhat flimsy segments, the outer and longer ones being soft primrose-yellow, and the inner ones bright yellow.

Franz Buchner is very gay; dwarf, and of good habit. Spikes full of flowers, more substantial than in many varieties; the segments are broad and rounded, rich apricot margined with yellow, yellow at the base, and spotted faintly all over with soft scarlet.

Antoine Barton is very handsome, its habit of growth being good, while the soft green leaves are margined with very pale green. The spikes are very sturdy, and secondary side spikes are plentiful. The flowers appear quite close together, and are about four inches across; the segments round and broad, pale yellow at the base, shading to gold at the apex, and freely and regularly marked all over with vermilion. The fourth and elongated segment has larger and deeper spots.

Comtesse de Vartoux Florence has an especially good habit, growing about two and a-half feet above the pot; the compact spikes are large, and carry an abundance of very bright and attractive blooms. The ground colour is golden-yellow, but somewhat paler at the base; the whole area of the segments is very freely spotted with vermilion-scarlet, the small spots often touching each other. This beautiful variety is figured in the present issue, the reproduction being from a photograph of one of the Chiswick plants, taken specially for the GARDENERS' MAGAZINE. Four large spikes were in flower together.

Egandale has handsome purple foliage with darker purple veins. It grows about three to three and a-half feet high, and bears large branched spikes of rich rosy-crimson flowers that are extremely effective in the bench, though not over fine individually.

Souv. de President Carnot is rather too tall a grower to become really popular, as it rises to a height of five feet. The leafage is large, dull green, with prominent purple ribs and margin. The spike is good, and [illegible] flowers of good size and fairly substantial for a canna; in colour they are of a lovely soft orange-scarlet shade all over.

Doyen Jean Liabaud is dwarf and compact, with full spikes of large blooms. The segments are broad and rounded, pale yellow at base and centre, but brighter elsewhere; the whole surface is marked with irregular spots of orange that produce a curious blurry effect.

T. D. Eisele is of medium height, and has dark green foliage margined with purple. The flowers are very compact, and more rounded than any others we have seen. With the exception of a little dull yellow shading at the base of the fourth and smallest segment, the flower is self-coloured and of a rich soft crimson-scarlet shade. The segments recurve slightly and prettily at the apex.

Alphonse Bouvier is a moderate grower with neat green foliage and [illegible] stems. The flowers are of medium size and fairly substantial; a [illegible] variety, coloured rich crimson-scarlet.

Comte de Bouchard is after the style of Comtesse de Vartoux Florence, but taller, and the yellow ground colour is scarcely so bright.

Garteninspector Massias is a very gay variety, dwarf in habit, but with somewhat small flowers; the segments are intense and vivid vermilion shaded with deep scarlet and bordered with gold; in some [illegible] the richer colour is divided by a band of gold. The reverse of the segments is also very brilliant.

Mr. Francis Gos, dwarf in habit, and with broad green leafage; flowers of good size, and of soft but distinct shade of orange-scarlet that [illegible] apparent.

[illegible] has purple stems and foliage, surmounted by branching [illegible] of large apricot coloured flowers.

Edward Mieg is a very dwarf habited canna, with a full spike of [illegible] self-coloured flowers; the shade is best described as very [illegible] scarlet with a rosy suffusion.

[illegible] is a tall, bold grower, with the broad handsome and somewhat [illegible] flowers that characterise its set. Some of the large outer segments are nearly three inches broad, and these have a large irregular [illegible] area of bright rosy-scarlet surrounded by a broad yellow margin. The two central segments are vivid scarlet, edged and marked with golden yellow. It is a pity these fine flowers are so fleeting.

Italia is a wonderful canna of bold habit and rather tall, and it has [illegible] blooms, in which five segments show a remarkable development in breadth and length. Each bloom measures about six inches across, the segments being fully two inches across. The three longer segments are pale yellow, heavily suffused and veined with golden-yellow, and marked in the centre with blood-red. The smaller segments are almost wholly covered with vermilion or blood-red.

Pandora is a strong grower, and has rich purple foliage and stems. The spike is large, and the flowers are from five to six inches across, deep rosy-scarlet, with a heavy suffusion of orange-scarlet, this being brightest at the margins. The small central segments are marked with dull yellow.

Bavaria is a tall grower, the topmost flower on a spike being about five feet above the ground. The habit of the plant is very close and erect, leaves and stems pale green. The spike is of fair size, but the flowers are immense, measuring four to five inches across, with fine, well-developed, broad and rounded segments of a rich canary-yellow, heavily marked over the basal half with scarlet. The front segment is heavily marked all over with scarlet.

Heria is another tall grower of the Italia section. Its blooms are very large, and the outer segments are rich yellow, with the base and centre covered with scarlet and blood-red, the colour looking as though splashed on. The inner and smaller pair of segments are almost wholly of a vivid blood-red colour.

CANTERBURY BELLS IN POTS.

To produce handsome flowering plants of Canterbury Bells in June and July, one must prepare the previous season, otherwise few plants are grown more simply and look more charming for house or conservatory decoration. Many lovers of hardy plants may not agree with my recommending Canterbury Bells as pot plants, but of late years there have been some splendid additions both in colour and form to the sections; the Calycanthema section is a beautiful one, and well worth pot culture, as few subjects are more showy in their season. For years I have paid special attention to the simple belled forms of Campanula pyramidalis, and these are equally beautiful, and probably more useful, as they last longer than the Canterbury Bells; but we have room for both for furnishing. I find Canterbury Bells are much admired at the season named, and those who saw the fine group at the Royal Horticultural Society's July meeting, sent by Messrs. J. Veitch and Sons, know what can be done to make the Canterbury Bells useful as pot plants. Of course, these plants can readily be grown and flowered in one year; we have done it in less by sowing under glass, but I would advise sowing in April or May for next season's flowering. Many do not grow the specimens in pots until they are a fair size, lifting them from open borders. By this method it is well to give more time, and I have seen specimens grown in the open for two seasons to obtain branching plants before they flowered. Pot culture, however, is more suitable for decorations, and by this method one may obtain more shapely examples.

We sow seed in May or June to produce flowering plants the next year, but those sown in the open and potted up, say, in August or September, will make shapely plants by next March, and may then be given a shift. Some may ask, why not sow in the open and allow the plants to remain till spring, then lift and pot up? This is an excellent mode of culture where labour is scarce, and a large pot is not objected too, for, in lifting at the season named, unless there is a good ball of soil, the plants will lose all their lower leaves, and at times will fail to flower freely. I like pot culture from the start for various reasons, the chief being that we then have compact plants that will stand a good deal of knocking about and flowers earlier, the latter being a gain, as Canterbury Bells when a mass of flower early in the summer are valuable for house decoration. Raised from seed sown in boxes in May, and placed in frames, the plants will be ready to prick out in a few weeks, and it is well to sow thinly, for the seedlings have a tendency to damp badly when sown thickly or given too much moisture. It is also advisable to keep the seedlings near the glass, and to prick off in a small stage; we place the seedlings in boxes, when large enough to handle, about two inches apart; they then lift nicely for potting into forty-eight pots at the early part of August, and are then stood close together on a hard coal ash base to keep out worms, and housed in a cold frame, or plunged up to the rims in ashes through the winter; the frames are best, as the plants do not like much moisture. In April we shift them into seven-inch pots for flowering, and stand them in rows, affording ample space to prevent the loss of bottom leaves. Given these attentions they make a compact pyramidal growth, and as soon as they have filled the pots with roots they may be given liquid manure freely. At this stage they take large quantities of water, and it saves labour if the plants are plunged after the final potting, but greater care is needed in the watering for a short time at the start. We have, when needing many plants, potted up from open borders, but prefer the pot culture from the initial stage.

In October, when housed in cold frames, the plants are placed in their distinct colours, this being noted at sowing time. Many beautiful shades of colour may be obtained by hybridizing; we have some of a pretty rose colour, which have a large cup-and-saucer-like corolla; this formation is also common in the blue and purple types; the mauve forms are very beautiful, as are also the pure whites. In the older section there are excellent double-flowered varieties, with the same colours as noted above. I find the rose and mauve varieties are the most tender when in a young state, the blue kinds being the strongest of all; but every colour may be obtained readily if given attention in the seedling stage. As regards soil, we pot in a firm manner in loam, with a portion of bone meal at the spring potting, and some fine old mortar at the autumn shift, the latter acting in two ways, as it gives better drainage in winter and assists in building up a sturdy growth for the summer flowering.

G. WYTHES.

Syon Gardens.

WORK FOR THE WEEK.

COOL ORCHIDS.

THE occupants of the cool houses enjoy the cool, dewy nights that usually prevail during this season, and at no time during the year do cool orchids grow more freely than at the present; to give the plants every opportunity of deriving benefit from the cool night air the ventilators should be left wide open. Should cold, cutting winds occur, such as we experience here occasionally, more care must be exercised with regard to ventilation. Slugs are usually a nuisance at this period, being very fond of eating the tender roots and flower spikes; they should be carefully sought for at night, and also trapped with lettuce leaves. Odontoglossum ramosissimum, O. Edwardi, O. Uro Skinneri, Oncidium undulatum, and O. macranthum are now pushing up their flower spikes, so a little cotton wool, placed around the base of the spikes, will help to protect them from slugs, as the pests find a great difficulty in crossing the woolly surface. The pretty and distinct Oncidium incurvum is now in flower, and it lasts a long time in perfection, but the spike should only be allowed to remain on the plants a reasonable length of time; after flowering, the plants should be kept fairly dry for some time, but not allowed to shrivel. Any plants of Odontoglossum Œrstedi that are in need of new receptacles should now be attended to, as root action is about to commence; well-drained shallow pans should be used, and a compost of equal parts of peat and moss will suffice for rooting material. It must be remembered that this odontoglossum thrives much better under a drier treatment than most species.

Plants of the charming Miltonia vexillaria will now be in a sufficiently advanced state of growth to admit of any being repotted or top-dressed that require it; but before this operation is commenced the plants should be carefully examined to make sure they are perfectly free from insects, as the little yellow thrips often conceal themselves right down in the interior of the young growths, and it is almost impossible to eradicate these pests with brush or sponge; the best method, we find, of destroying these insects is to dip or wash the young growths in some safe insecticide, afterwards rinsing them well in some tepid soft water. X L. All liquid insecticide is very effective, at the rate of one part to twenty parts of water. Repotting should only be done in cases where they have overgrown their receptacles, or the material is in a sour condition; these should be carefully taken out and all the old material possible removed, without injury to the living roots, and all decayed roots cut away. Pots or pans of a suitable size should be filled to about three quarters of their depth with clean drainage, upon which should be placed a layer of clean moss, the old living roots should then be carefully laid over the drainage, and a compost of equal parts peat and moss, with a small quantity of finely-broken crocks and charcoal intermixed, should be worked in amongst them, mounding the plants up somewhat from the edge of the pot. After potting water must be sparingly afforded through a fine rose; when the new growths commence to root freely and have a good hold on the compost, the water must be gradually increased, but during the winter months the plants should be kept rather dry; the temperature of the cool house will suit them until the nights become chilly, when they should be removed to the intermediate house.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

BULBS of various kinds play a most important part in affording both cut bloom and plants for decorative purposes, from November until late spring. Few are more useful than the Roman hyacinth, especially as they force so freely, and with ordinary care their pure white, sweet-scented spikes may be obtained before midwinter. The great secret, however, in forcing these and other bulbs successfully is to have them well rooted before they are placed into heat. No time must now be lost in securing all the early kinds at least, and have them either potted or planted in shallow boxes. About five bulbs of Roman hyacinths, or any of the early tulips, placed in forty-eight sized pots come in useful for furnishing baskets, vases, and side stages of the conservatory; but when they are grown chiefly to be used for cutting, a saving of room and labour will be found in growing them in shallow boxes. These should be about thirty inches long, nine inches broad, and three inches deep, so that they can be arranged on shelves near the glass to give substance to the flowers as they unfold during the sunless days of November. Ordinary rich, light soil will grow most bulbs satisfactorily, though a more carefully prepared compost should be used for later kinds, especially hyacinths and other things intended for exhibition. It is best to prepare a good heap of compost at once, as the same will be found suitable for all kinds. The staple should be good rich loam, to which add one fourth partially decayed leaves or spent mushroom-bed manure, a six-inch potful of crushed bones, and half that amount of soot to each barrowful, together with a good sprinkling of sharp sand. If this can be got together in an open shed, turned over several times, and kept covered with mats to retain moisture, the right material will be in readiness whenever it is required to pot up the different sections. Unless it be some of the large growing narcissi or liliums, pots six inches in diameter will be found the most convenient size, as these generally fit into the vases used in dwelling rooms, and allow for the surface being mossed over neatly. Supposing all the early section is potted up at once a suitable position must be selected to plunge them until they are sufficiently rooted for placing in the forcing pit. It is a mistake to select a cold, damp spot, such as the foot of a north wall, as here root action is retarded; far better arrange the pots, or boxes, on a hard bed of ashes, in a warm, sunny corner, where, with the soil kept in a suitable condition, the formation of roots is greatly assisted. If there is a danger of worms working through the drainage into the pots, sprinkle the site well with soot, before the pots are arranged. The pots themselves may be plunged in fine ashes, but we do not recommend covering them with the same material, and would rather use cocoanut fibre, fine sand, or sifted leaf mould. Neither of these should be used too thickly to ward off the warmth from the sun, the covering is merely used to retain a uniform moisture in the compost the bulbs are placed in, and for the most part they will be removed to cold frames before severe frosts set in. If there is a danger of rats or mice getting to the bulbs fine meshed wire netting should be used to keep them at bay.

The sooner the whole stock of bulbs required for winter and spring use can be obtained the better, as they lose their plumpness, after being exposed too long. Lilium Harrisi bulbs promise to be very fine this season, and care should be taken that they are not damaged in unpacking, or in potting them up. These should not be allowed to remain in the packing case a day longer than is necessary, as they are apt to become heated. Only last season a case of bulbs was delayed in transit, and owing to the fibre they were packed in being moist, they had become quite warm in the centre, and roots and top growth had become matted together, which resulted not only in unnecessary trouble in unpacking, but the bulbs themselves were considerably weakened, and after they were potted, had to be kept rather close and shaded until the blanched growth had gained both strength and colour. I mention this as a hint to those who may be unfortunate enough to receive bulbs in such a condition this autumn. A good stock of freesias should be grown wherever there is a demand for sweet scented flowers. The bulbs are cheap and are easily forced. Place them rather thickly in medium size pots, but like other bulbs, make no attempt to force them until they have made plenty of roots, and a couple of inches of top growth in a cold frame, they are then in a safe condition for placing on shelves near the glass in a warm pit when each bulb will throw up a strong spike. The season is with us when pelargoniums of the fancy section will need attention. The plants having been thoroughly ripened off in a sunny spot, may be pruned hard back. Some of the tops may be made into cuttings and rooted in a cold frame if it is required to increase the stock. The plants may be arranged close together in a cold frame; withhold water at the roots for a time, but moisten them overhead, and close the lights before the sun has passed off each afternoon. The old stems will then produce numerous shoots, which may be thinned out, when about an inch long. The plants too, will then be in a suitable condition for shaking out, cutting back some of the straggling roots and repotting into smaller pots.—R. PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

IN the southern districts most of the late potatos will by this time be ready for lifting, therefore this work should be taken in hand without delay, for after such a long spell of hot, dry weather we may expect a quantity of rain when a change takes place, and should this be so many of the tubers would no doubt become diseased if allowed to remain in the ground. It is not yet too late to make a sowing of turnips for pulling in spring, but the sooner the seed is got into the ground the more chances there are of a crop. The quick-growing varieties should be chosen as these are usually the most hardy. Winter spinach, too, should now be sown. That which is put into the ground now will usually give a supply late in spring as it is not so liable to run to seed should there be dry weather during March and April. Winter spinach is rather a trying crop in some districts, particularly when sown too soon, as a rapid growth is made during the mild weather in autumn, which proves too sappy to withstand the early frost, the consequence being total failure at the time when most required. Young plants should be thinned to a distance of about six inches, and when sufficient growth has been made to permit of them being used every other plant should be drawn for the kitchen so as to give the others more room to develop.

The unusual hot, dry weather has been very trying for late peas, so much so in the south-east that unless watering has been attended to they will be a total failure. With us the sun-heat during the past fortnight has on most days been recorded on the thermometer as 118 or 120 degrees, while in the shade it has been from 85 to 92 degrees; with such weather, there is little wonder at the difficulty experienced in persuading plants to grow, particularly such moisture-loving subjects as peas. Where due consideration was given to the selection of varieties and attention paid to watering, the plants have made a good growth, and are now showing bloom; to enable them to fill the pods copious waterings must be afforded, and the foliage moistened of an evening to prevent mildew. All of the brassicas will need an abundance of moisture to keep them growing, therefore do not fail to pay particular attention to this or failure will be the result. With such hot weather one is apt to forget that the autumn is fast approaching, and that we may in the course of a few weeks have sufficient frost to cut down tender plants, when a stop will be put to many of our tender vegetables. Peas and dwarf beans should be sown in pits where protection can be afforded, as by so doing the supply will be prolonged. Continue to plant out lettuce and endive, and make another sowing towards the middle of the month of onions, cauliflower, lettuce, and other salads. —H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

Except in those gardens where the glass accommodation is quite equal to the requirements, and there is no need to utilise vineries for plant growing, the great aim during the present month will be to ripen up the late-keeping grapes so that they may be ready for cutting by the end of the month, when chrysanthemums, and the many other things grown for winter decoration, will have to be brought under cover. Unless grapes are well finished on the vines before the end of September they will hardly be found satisfactory to the consumer when their time comes for consumption. This applies more particularly to white Muscats, and to bring these up thoroughly fire heat in the autumn is generally found necessary. The grower should not rest satisfied until his grapes have assumed the deep amber tint so gratifying to connoisseurs; unless this stage is reached the flesh will be watery and insipid later on. The necessary fire-heat should be carefully applied, letting it range fairly high during the daytime, and reducing it towards evening and through the night. Late black grapes are also greatly improved in flavour by the judicious application of fire-heat, under the genial influence of which such grapes as Gros Colman lose the muddy flavour which they acquire under cooler treatment, and become quite passable grapes in quality. Another matter which will require consideration in finishing-up grapes is the condition of the border as to moisture, many growers fearing to give sufficient water to their inside borders in the autumn from a wholesome dread of decayed berries; but when the watering is carried out early on a fine day the surface becomes sufficiently dry before night to prevent any undue amount of evaporation. Dry borders not only lead to shrivelled berries, but they are really bad for the vines themselves. The dry state of our inside borders during the autumn and winter is totally opposed to the natural conditions of things, and much to be deprecated.

Careful firing to keep up temperatures in the pine-houses or pits will now be necessary, as it is unwise to depend much on the heat produced by the plunging materials and linings now that the nights grow longer and cooler. Close up the houses quite early in the afternoon, while there is sufficient sun heat to raise the temperature, and mat up the pits at night. These little attentions will appreciably reduce the coal bill. Ripening fruits should be kept warm, rather dry at the roots, and in a very light position close to the glass. If possible, they should be grouped by themselves. To plants carrying fruits in an advanced stage of swelling, liquid manure should be given as frequently as it becomes necessary to water them, so that they may swell away quickly, and attain size before the supply of liquid of any kind will need to be greatly curtailed, as it will be ere many weeks have passed. Bananas showing fruits or growing strongly will enjoy liberal supplies of water, and, in the case of the former, it should take the form of liquid manure applied at a fairly high temperature. Give the plants the nearest possible approach to tropical treatment all round, then there need be no fear that sooner or later good bunches of fruits will be produced, and that they will not perish in their incipient stages. Strawberries potted off and stood thickly in batches some weeks ago should now be thinned to a convenient distance apart, and if stood in square blocks, a row should be left out here and there to allow room for walking between them, so that each plant may be easily examined as to its need for water. They should now take water freely, and never be allowed to become dry, as this, and the subsequent watering to bring them round again, tends to break up the crowns. On the other hand, over-watering does much harm, indeed, newly-potted plants rarely recover from an overdose of water, and may just be thrown away if such a thing occurs.—J. C. TALLACK, *Livermere Park Gardens.*

EXHIBITIONS AND MEETINGS.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

Annual Show.

The annual show of this society was held in the Duthie Park, Aberdeen, and the weather during the whole three days was simply ideal. A word of praise is due to Mr. Harper, the custodian of the park, for the beautiful spectacle he provided for the numerous visitors. The arrangements made by Mr. J. B. Rennet, secretary of the society, were of the most perfect order. Three large marquees were devoted to the various exhibits, one being for pot plants, another for cut flowers and fruit, and a third for vegetables. The exhibition showed an improvement on that of last year, but there was a slight falling off in vegetables. On the other hand, there was an increase both in numbers and quality of the entries for fruit and cut flowers.

Cut Flowers.

Here there was a splendid display, especially in herbaceous plants. Dahlias, however, were disappointing, which the backwardness of the season easily accounts for. A most creditable display was witnessed in carnations, asters, and marigolds. The professionals, as was to be expected, were a long way ahead of the other classes of exhibitors. This position of matters was especially noticeable in roses. where Messrs. D. and W. Croll, Dundee, had first for H.P.'s, and won second prize for teas. Messrs. Adam and Craigmile, Rubislaw, Aberdeen, were first for teas and second for H.P.'s. There is not the slightest doubt that had the latter firm shown their H.P.'s in a fresher condition, the Messrs. Croll would have had to take a less honourable place. The blooms they showed were exceedingly fine, but decidedly marred through being too long cut. Mr. John Smellie, Busby, was first with a fine show of cactus dahlias. The bouquets shown were of very fair quality, Mr. John Robertson, Ferryhill House, taking premier honours with a mixed bouquet; while Mr. Robert Kiloh, Woodlands, Cults, was first for sprays and also for buttonhole bouquets. We have seen much better model gardens at this show in previous years, but Mr. James Lennie, The Lodge, Bannermill, had certainly the best. Sweet peas were specially represented, and very fine in quality, Mr. Alexander Grigor, Fairfield, being first. In the professional class for stocks, Mr. Robert Kiloh, Woodlands, was first, for twelve spikes, with a splendid display; while Mr. A. Reid, Durris, was first, with a very fine turnout of six bunches of stove and greenhouse flowering plants. The entries for cut geranium trusses were few, but Mr. William Ogg, Morken, deservedly carried first honours with a splendid lot; while Mr. James McDonald, Balgownie Lodge, was first for twenty bunches of cut flowers from the hardy flower garden. Pompon dahlias were good, but there were few entries for show dahlias, Mr. Robert Kiloh, Woodlands, being first for the former, and Mr. George Milne, Cluny Castle, for the last-named. There was a good average display in the professional class for roses, although teas and H.P.'s. were not so big. Mr. George McLennon, Fetteresso Castle, was first for twenty-four roses, while Mr. William Coutts, Ellon, was first for twelve. Mr. G. Roy, Dalhebity, carried off the chief honours for six teas.

Pot Plants.

These formed a very strong section, both professionals and amateurs being represented by some magnificent specimens. The blue ribbon of the show for the group of plants arranged for effect on the ground in a circle of ten feet diameter, went to Mr. John Proctor, Devanha House, Aberdeen, for a magnificent collection most artistically arranged, consisting of crotons, dracænas, palms, screw pines, amaryllis, colosias, clerodendrons, begonias, orange trees, and orchids. Mr. Proctor's was the only entry, but the verdict of competent judges was that this group was the finest ever seen in Aberdeen. The first prize for the best six specimen stove or greenhouse plants, distinct, three flowering, three foliage, not otherwise provided for in the schedule, went to the same gentleman. The entry was composed of Anthurium Veitchi, Dasylirion acrotrichum, Eucharis amazonica, Hæmanthus Lindeni, and Ixora Williamsi. We must congratulate Sir William Henderson, of Devanha, for the splendid displays made by his gardener, Mr. Proctor. For the best specimen plant in flower, Mr. A. Howie, Drumtochty Castle Gardens, won the Society's silver medal for a grand specimen of Disa grandiflora superba, an orchid for which he was offered £15; and the same competitor was also first for two orchids, distinct, with Cattleya Harrisoniæ, and Disa grandiflora superba. There was only one entry for the best specimen foliage plant, but it was a grand one, and Mr. James McDonald, Balgownie Lodge, thoroughly merited the first prize. In all the other sections of the same division there was a grand show. Pelargoniums, both tricolor and bronze, were very fine, while hardy chrysanthemums, though few, were also a splendid display, as were specimen geraniums in pots from amateurs and professionals. Petunias were also a strong class, and ferns fairly good; while pelargoniums, considering it was late in the season, were very good. Begonias were a splendid class, Mr. Ogg, gardener at Morken House, taking premier honours in both classes for doubles and singles. Liliums were also very good; and among a good show of gloxinias Mr. Ogg again came to the front. Among other gardeners who distinguished themselves in this section were Mr. Alex. Grigor, Fairfield; Mr. Alex. Robb, [illegible] Park; Mr. G. Leslie, Bonnymuir; and Mr. G. Maitland, Woodside.

Fruit.

In this department the entries were more numerous than last year, and the quality was distinctly better. The leading honour in this section—the teapot for the best collection, nine dishes, distinct varieties, but not more than two dishes of any species or kind of fruit—went to Mr. Andrew Reid, Durris House, for a splendid collection, consisting of melons, grapes, peaches, nectarines, cherries, and figs. The judges were inclined to the collection sent in by Mr. Hutton, Usan House, Montrose, but it was held that nectarines and peaches were of the same species, and he was accordingly disqualified. For the collection of hardy fruit, six dishes, Mr. Alexander Milne, Queen's Road, Aberdeen, was first with a splendid display. This gentleman was also first for the collection of strawberries. Mr. Harper, Perth, was first for cherries, while Mr. A. Hutton, Usan House, secured premier honours for raspberries. The last-named gentleman was also deservedly awarded chief honours for peaches and apples; while Mr. Reid, Durris House, took a similar place for melons. Mr. A. Howie, Drumtochty House, was to the front with splendid collections of nectarines, pears, and tomatos; while Mr. Grant, Crimonmogate, was also first for one dish of pears. There was splendid competition among the grapes, Mr. A. Hutton being first for four bunches, distinct; Mr. Reid being a good second. For two bunches, distinct, Mr. [illegible] M. Stuart, Eden, Banff, was first, Mr. Reid again taking second honours; and the same gentlemen retained these positions for one bunch of white.

Vegetables.

This was the poorest section of the show. Potatos were weaker than they have been at Aberdeen for some years. For the best collection of vegetables, arranged in a box four feet by three feet, outside measurements, and comprising eight varieties—namely, peas, cabbage, cauliflower, potato, turnip, carrot, onion, and parsley—open to gentlemen's gardeners only, Mr. James Grant, Rothienorman, was first; while Mr. Thomas Middleton, Monymusk House, was a capital second. For the collection open to gardeners only, Mr. A. Paterson, Ruthrieston, was first. Among the other prizewinners worthy of mention in this section were: Mr. A. Middleton, Woodside; Mr. A. Howie, Fordoun; Mr. W. Harper, Perth; Mr. W. Milne, Midmar; Mr. T. Gall, Hobshill; Mr. W. Milne, Corsindae House, Midmar; Mr. Frank Kinnaird, Broomhill; Mr. John Brown, Delgaty Castle; and Mr. W. Lawson, Oakbank School.

Non-Competitive.

There were some magnificent entries, for exhibition only, made by nurserymen and seedsmen. Messrs. Ben Reid and Co. exhibited a beautiful collection of plants and flowers, including ornamental conifers in pots, herbaceous flowers, gladioli, and carnations. Messrs. James Cocker and Sons, Aberdeen, had a grand lot of herbaceous flowers, roses, pot plants, bulbs, &c., beautifully grouped in a spacious marquee. Messrs. W. Smith and Son, nurserymen and seedsmen, Aberdeen, had also a prominent display in the marquee in which the plants were exhibited. The floral work displayed was very artistic, the table on which the designs were shown being flanked with handsome mirrors, tastefully draped with velvet and plush. The Ichthemic Guano Company, Ipswich, exhibited their large octagon stand, and around its base was a beautiful collection of fifty different varieties of sweet peas, sent by Mr. H. Eckford, of Wem, Shropshire.

SANDY AND DISTRICT HORTICULTURAL SOCIETY.

There is no diminution whatever in the popular appreciation of the Sandy Flower Show, for the thirtieth annual exhibition appeared to be more fully attended than ever. The day was brilliantly fine, the throng of visitors enormous for so small a place and so scattered a district. It is probably the most comprehensive schedule of prizes offered. There are two hundred and thirty-eight classes in what is known as the horticultural departments, but they include a few for needlework. There is one for stuffed animals, birds, or fishes; two for examples of home carving; sixteen for honey, butter, eggs, loaves of bread, and trussed poultry; and there are one hundred and forty-six further classes for dogs, poultry, pigeons, rabbits, cats, and cage birds. There is something of almost everything to interest the country people, and a large number of tents are required to house the various exhibits.

Some large specimen plants are indispensable to Sandy, and so are good cut flowers, therefore certain classes in which good prizes are offered are open to all comers. Mr. James Cypher is always an exhibitor at Sandy, and on this occasion he was an easy first with ten stove and greenhouse plants in flower, having fine examples of Clerodendron Balfourianum, Phenæcoma prolifera Barnesi, Allamanda Hendersoni, Ixora Duffi, a fine example carrying excellent trusses, Bougainvillea Sanderiana in capital condition, with Ericas Austiniana, Marnockiana, Aitoniana, and Irbyana. Mr. W. Finch, Coventry, was second, his leading plants being Ixora Williamsi and I. Fraseri, Allamanda grandiflora, and Ericas Marnockiana and Aitoniana. Mr. Redman, St. Neot's, was third. In the class for twelve zonal pelargoniums, Mr. T. Lockie, The Gardens, Diddington Hall, St. Neot's, was first with well-grown and flowered bright specimens. Then there was an open class for table plants, and also for a group of plants arranged in a space not exceeding fifty square feet; Mr. Empson, gardener to Mrs. Wingfield, Ampthill, was first with a very pleasing arrangement, palms, crotons, orchids, pitcher plants, abutilons, nerines, &c., being well disposed in a finished group. Mrs. Axtell, Woodbury Hall, was second; and Mr. W. Finch, third.

In the amateurs' division Mr. Empson was first with six fine foliage plants having in excellent condition Kentia Belmoreana, Dracæna Sanderiana (a fine piece), and D. australis variegata, Croton Weismanni, Heliconia illustris, and one other; Mrs. Axtell was second. There were classes for six stove and greenhouse plants. Coleus, represented by good coloured and well-grown bushes; begonias, achimenes, balsams, &c., with specimen foliage and flowering plants. The four cockscombs shown by Mr. T. Lockie were marvels of good culture. They were uniform in size and appearance, and measured from end to end nearly two feet, and in width fifteen inches. They were of the purple-tinted type. Mrs. Axtell came second, also with very good specimens.

Some excellent cut flowers were shown in the open classes. Messrs. Harkness and Sons, Hitchin, had the best forty-eight cut roses, staging some very good blooms indeed for the season of the year, viz., Mrs. J. Laing, Charles Lefebvre, Maréchal Niel, John S. Mill, Madame J. Cointet, Ulrich Brunner, Star of Waltham, Horace Vernet, Madame J. Litre, Maman Cochet, &c.; second, Mr. J. Mattock, Headington, Oxford; third, Messrs. G. and W. Burch, Peterborough. With eighteen tea-scented roses, Mr. J. Mattock was first, having a very creditable lot of blooms, chief among them being Maman Cochet, Maréchal Niel, Catherine Mermet, Souvenir d'Elise Vardon, Comtesse de Nadaillac, &c.; Messrs. Harkness and Son were second with good examples of the same varieties.

Messrs. Harkness and Son were first with twenty-four spikes of gladioli, a fine lot including some highly promising seedlings of their own raising; Mr. C. Bright, Huntingdon, was second; and Mr. W. Bowise, Cambridge, third. Some very good dahlias were shown. Messrs. Keynes, Williams, and Co., Salisbury, were first with twenty-four varieties, having in fine character Dr. Keynes (a model in form), Buttercup, John Walker, Mrs. Glasscock, W. Keith, J. Hickling, Arthur Ocock, &c.; Mr. John Walker was second; and Mr. S. Mortimer, third, both with very good flowers, but the latter's blooms were a little undersized. Messrs. Keynes and Co. had the best twelve fancy dahlias, very good even blooms; chief among them Emin Pasha, Gaiety, Duchess of Albany, Mrs. Saunders, Geo. Barnes, Peacock, Mrs. John Downie, &c.; Mr. George Humphries was second with smaller but neat blooms; and Mr. J. Walker, third. Mr. C. Bright was first with twelve pompon varieties of dahlias in bunches; and Mr. G. Humphries was second. The first prizes should have gone to this collection, as they were small, even, and bright, Mr. Bright's flowers being over large and uneven. Mr. J. Walker, who was third, should have been second.

A rare box of twelve bunches of cactus dahlias came from Messrs. Keynes and Co., and formed one of the most attractive features of the show; it also included some highly promising new varieties. The leading bunches were Wallace, Viscountess Sherbrooke, Countess of Lonsdale, Keynes' White, the best bunch of this variety we had yet seen; Stella, Harmony, Charles Woodbridge, and Night; Mr. C. Bright was second; and Mr. J. Walker, third. With twelve bunches of single varieties, Mr. T. W. Girdlestone, Sunningdale, was first, with a perfect stand of small-sized even flowers that served to set up a standard of what single dahlias should be. The leading varieties were Puck, Violet Forbes, Princess Pepilo, Ruy Blas, Ganem, Naomi Tighe, Folly, and others; Mr. J. Walker, second. Mr. Girdlestone obtained three certificates of merit.

A remarkable feature was the open class for twenty-four bunches of herbaceous and bulbous flowers; and it brought two very fine exhibits, one from Messrs.

Harkness and Sons, who were placed first, and the other from Messrs. Laxton Bros., Bedford, who were placed second. The latter somewhat discounted the value of an imposing collection by staging seven bunches of herbaceous phloxes. Gaillardias, lilies, Iceland poppies, Chrysanthemum latifolium, helianthus, coreopsis, Scabiosa caucasica, Asclepias tuberosa, Anemone japonica alba, montbretias, &c., made up the collections. In the amateurs' classes some very creditable bunches were also staged.

In the amateurs' division Mr. R. Burgin, of St. Neot's, was the principal prize-winner with dahlias. There were many classes for cut flowers; too many to be particularized. A tent devoted to table decorations was an attractive one for the fair sex, the principal feature being arranged dinner tables. There was a large number of entries, and generally they were executed in excellent taste. Miss Ethel Pearson, Sandy, was first, the flowers employed, annual xeranthemums and Scabiosa caucasica; a simple but highly tasteful arrangement. Mr. Maddison, St. Neot's, was second, and Miss Logsden, Hitchin, third.

The only collection of fruit in eight kinds came from Mr. Empson, who had Alicante and Foster's Seedling grapes, Bellegarde peaches, Hardwicke nectarines, pears, etc. Mr. T. Lockie had the best six dishes of fruit; Mr. R. Carter, grower to Mrs. Axtell, was second. There were classes for grapes, peaches, nectarines, cherries, apples, and pears; good fruit on the whole being staged.

Vegetables were very fine, as might be expected in the very heart of such a market gardening district.

A remarkably attractive collection of charming garden roses in bunches from Mr. Mattock was a good feature, and a fine collection of plants from Messrs. W. Cutbush and Sons, Highgate, was staged. The pretty pink Chironia baccifera was included.

ROYAL OXFORDSHIRE HORTICULTURAL SOCIETY,

August 23.

On Tuesday, by permission of the Radcliffe Observer (Dr. Rambaut), the Royal Oxfordshire Horticultural Society held its second show for the year at the Observatory, and thus completed its sixty-ninth year. The grounds are spacious, well enclosed, and possess a number of ornamental trees which afford shelter and shade. Two tents, seventy feet by forty feet, sufficed to stage the plants, blooms, and fruit, the bulk of the vegetables being staged on tables in the shady walk adjoining the Infirmary. Entries were not equal to the average of an August exhibition, but any lack in quantity was balanced by general good quality in the bulk of the classes.

The display was augmented by the following extra productions, viz.: A very large collection of herbaceous perennials, &c., from Mr. H. Deverill, Banbury, whose showy exhibit secured a very high commendation. Mr. Perry, Banbury, also put up some novelties in the way of garden flowers and also an Irish harp of choice blooms, the strings being the white heads of Achillea millefolia. Mr. H. M. Turner put up a dozen bottles of run honey; and Mr. J. Baker, Aston Street, exhibited a basket of ripe blackberries, demonstrating how the size and colour of the wild bramble may be improved by garden culture.

In the plant classes there were any number of good things, and, if we except some non-placed fuchsias, the quality was decidedly good. For six stove and greenhouse varieties Mr. Jacob, Witney, was the only exhibitor, his three foliage plants being palms and a cycad, the flowering specimens were Bougainvillea Sanderiana, Statice profusa, and Anthurium Scherzerianum. The single specimens were generally full-sized; for a stove plant, Mr. Mattock put up an orchid, Lælia purpurata, and Mr. Anstiss a well-flowered Hoya carnosa; for foliage, Mr. Jacob was first for a towering, spreading Kentia Forsteriana; Mrs. Hartley second with an immense bush of the highly-coloured croton, Baroness Rothschild. For greenhouse, Mr. Mattock had a columnal pyramid of fuchsia, Doel's Favourite, scarlet tube and petals, purple corolla, a very fine plant densely bloomed; Mr Jacob second, with Statice profusa. The best amateur's plant was a giant Phormium tenax (New Zealand flax), exhibited by Mr. Cross, who was also first with a large blue African lily (*Agapanthus umbellatus*); the best greenhouse plant came from Miss Greswell, who put up a very fine bush of fuchsia, Lady Haytesbury, waxy white tube and sepals, rosy-purple corolla. The premier hardy plant in flower was a large piece of Statice incana, and a very large bush of the pale blue Plumbago capensis came from the representatives of the late Mr. E. Thorne. Coleus with their high coloured foliage were nice plants all through; and the groups of begonias were very showy amid a setting of small ferns. The hardy ferns in twelve varieties were a nice distinct collection; and the very large specimen greenhouse ferns of Mr. Johnson's were well worthy of the post of honour conferred. Fuchsias, as exhibited by Mr. J. Bates, sen., and Miss Greswell, were nicely grown and well-flowered, and zonal geraniums, though a limited competition, were excellent. Cut flowers occupied a considerable range of tabling; the show dahlias, though fewer than usual, were very attractive. Mr. Walker, Thame, was the only exhibitor of 24 varieties; his stand containing a well balanced collection of blooms. Mr. Walker was also first for a dozen triplets of single dahlias, and also cactus forms; the best dozen sets of pompon dahlias came from Cross Ways garden, the individual blooms like so many rosettes from white to darkest maroon. Double zinnias were generally large flowers of bright colours, but the asters scarcely touched the high water mark of quality usual at the Oxford August show. Roses from Headington were equal to mid-season blooms, all bright, clean, and shapely. Herbaceous phloxes have seemed to enjoy the warm temperature of late, and the annual variety known as P. Drummondi was exhibited in many pretty forms. Hardy perennials always make a fine show, and when well posed, as at these shows, prove wonderfully attractive; Mr. Johnson's premier collection contained phlox, rudbeckia, helianthus, scabiosa, everlasting pea, montbretia, gaillardia, coreopsis, and carnations.

Fruit was tempting, but some of the out-door varieties were not ripe, notably the plums. The grapes were very nicely finished, the white forms being Muscat of Alexandria and Buckland Sweetwater, Black Hamburgh and Alicante, some of the latter being very fine; peaches were Grose Mignonne, Princess Royal, and Alexandra Noblesse; nectarines Lord Napier and Pine Apple; dessert plums Jefferson's and July Gage; pears Windsor and Jargonelle; culinary plums Magnum Bonum, Victoria, and Orleans; dessert apples Irish Peach, Red Astrachan, and Quarrenden; cooking apples Warner's King, Ecklinville Seeding, and Grenadier.

Vegetables numbered nearly 400 exhibits, nearly one half being the contribution of cottagers. As a whole roots were larger than could have been expected; cauliflowers were present in three tiny heads, celery was fair, but peas and beans had reached a goodly size; with the latter Mr. Holton headed the list in the gardeners' class, Mr. Newman in the amateurs', and James Simmons in the cottagers' for runner beans of great length. Potatos were represented by about 1,100 tubers, all fairly clean and shapely, the following varieties being principal winners: Sutton's Satisfaction, Snowdrop, Coles' Favourite, Mr. Bresee, Vicar of Laleham, and Reading Giant.

THE KINGSWOOD HORTICULTURAL SOCIETY, August 24.

This is also known as the West Gloucestershire Horticultural Society, and is probably the principal exhibition of the kind held in the Bristol district. Many of the miners, shoemakers, and other artisans who inhabit this portion of the county are keen florists, and grow very good things, having a keen appreciation of what constitutes quality.

As is usual in such societies, a number of classes are thrown open to all comers, with the result that a fine display is secured. Handsome prizes are offered for sixteen specimen plants, ten in flower and six in foliage. Mr. James Cypher brought a very fine lot, and took the first prize with Kentia Forsteriana, K. Belmoreana, and K. australis, Latania borbonica, and two fine crotons forming the background; in front of these such fine flowering subjects as Bougainvillea Sanderiana, Statice profusa, Ixora Duffi, Erica Austiniana, and Aitoniana Barnesi, Statice intermedia, Allamanda nobilis, &c.; second, Mr. W. Vause, Leamington, who had fine pieces of Cycas circinalis, Latania borbonica, good crotons, and flowering specimens, chief among them Allamanda nobilis and Erica Austiniana. The best group of plants filling a space of one hundred feet also came from Mr. Cypher, and the second prize went to Mr. W. Vause.

Some good tuberous-rooted begonias were staged. The best eight single varieties came from Mr. J. Rogers, a local grower, and they were well done; Mr. G. Tucker, Hilperton, Trowbridge, was a good second. With four varieties of singles the first prize was also awarded to Mr. J. Rogers. The double varieties were equally good. Mr. C. Cornish, gardener to F. J. Farr, Esq., was first; and Mr. R. Denton, gardener to the Rev. R. Fawsett, second, both showing in good form. The best six specimen zonal pelargoniums came from Mr. W. J. Mould, Bath, and Mr. E. W. Towell, gardener to Mrs. G. Coles, was second. Mr. G. Tucker had the best eight exotic ferns, staging some good adiantums and others; Messrs. R. Pulman and Son, Bristol, were second.

Kingswood may be said to be largely a cut-flower show. Roses were a good feature, Dr. Budd, of Bath, showing in fine character. He was first with twenty-four varieties, three blooms of each, a somewhat heavy demand at this season of the year. He had good representatives of Comtesse de Nadaillac, Caroline Testout, The Bride, Perle des Jardins, Maman Cochet, Hon. Edith Gifford, Maréchal Niel, Mrs. J. Laing, Marie Van Houtte, &c.; second, Mr. A. A. Walters, Kensington Nurseries, Bath. With twelve varieties, (three blooms of each, Mr. Thomas Hobbs, St. Mark's Road, Bristol, was first, with clean, bright blooms of Mrs. J. Laing, Comte de Raimbaud, Horace Vernet, Charles Lefebvre, Duchess of Bedford, and others; Dr. Budd was second.

The best twenty-four dahlias came from Mr. W. J. Treseder, nurseryman, Cardiff, with some good blooms, chief among them being Dr. Keynes, Prince Bismarck, J. Hickling, Earl of Ravensworth, Colonist, John Ashby, Willie Garratt, Mrs. J. Downie, &c.; second, Mr. G. Humphries, nurseryman, Chippenham. With twelve fancy dahlias Mr. Humphries was first with a good stand, having in character Mrs. Saunders, Comedian, George Barnes, Frank Pearce, Dazzler, Lottie Eckford, &c.; Mr. W. Treseder second. Mr. J. Burgess had the best twelve bunches of single varieties, a little large in size, but fresh and well-balanced; Mr. Treseder was second. The latter was first with six bunches of cactus, showing this type in finished character; Mr. Humphries second.

The best twenty-four blooms of quilled asters—a heavy quantity to supply in such a season—came from Mr. C. H. Vickery, Bath, and they were much better in quality than could have been expected; and first also with twenty-four of the flat-petalled type. Mr. F. Hooper was second, with quilled; and Mr. G. Humphries second, with flat-petalled. Phlox Drummondi, shown in twelve bunches, were very pretty indeed, and they have quite driven the verbenas out of the field. Mr. Smith, Kingswood, had the best twelve spikes of herbaceous phloxes; Mr. F. Hooper was second.

Cut blooms of begonias, both double and single, were shown in good character, Mr. J. Rogers taking the first prizes with twelve double and also with twelve single. Hardy flowers in bunches of twelve were a leading feature, Mr. W. Smith taking the first prize with bold examples of Harpalium regidum, Senecio pulcher (very fine), White Everlasting pea (a very fine large-flowered variety), Campanula pyramidalis, &c.; Messrs. J. Stokes and Son, Frome, were second.

In the amateurs' division for six stove and greenhouse plants, Mr. W. Rye, was first with a good collection. Chief among the specimens were Bougainvillea glabra, Ixora regina, Allamanda nobilis, and Statice profusa; second, Mrs. G. Coles, with similar subjects. Captain Belford also had the best six exotic ferns, which included Davallia Fijiensis, Todeas superba, and pellucida, &c; Mrs. R. Palmer was second. Captain Belford was first with six foliaged plants, having good crotons and palms; Mrs. G. Coles coming second.

The show of fruit was a good one. The best eight dishes came from Mr. W. Strugnell, The Gardens, Rood Ashton, Trowbridge, who had Madresfield Court and Muscat of Alexandria grapes, Sea Eagle peaches, Pineapple nectarines, apricots, plums, &c.; second, Mr. W. Allan, gardener to W. Marsh, Esq., who had Gros Maroc and Muscat of Alexandria grapes, peaches, nectarines, &c. The best two bunches of black grapes were Hamburghs, from Mr. T. Williams, gardener to the Rev. T. Greaves; Mr. J. Trewhill, gardener to G. C. Tudway, Esq., was second, with the same. The best two bunches of white grapes were Buckland Sweetwater, from Mr. J. Marshall, gardener to J. Dole, Esq.; the Rev. T. Greaves was second, with Muscat of Alexandria. The best dish of culinary apples was Peasgood's Nonsuch, from Messrs. R. Palmer and Son; Mr. E. Hall came second, with Lord Suffield. Mr. George Garroway had the best dish of dessert apples, showing Irish Peach; Mr. Hall was second, with Red Quarrenden. The best dessert pear was Jargonelle; the second best, Doyenne Boussouch. A silver cup, offered for eight dishes of fruit, was also won by Mr. Strugnell; second, Mr. Wallen, with a good collection.

Vegetables were numerously shown in the open and amateur classes, clean and bright. The competition was very keen in some of them.

THAME FLOWER SHOW, August 25.

It is very probable that scarcely any one of the founders of the Thame Horticultural Society was present on Thursday to inspect the fiftieth exhibition held in the spacious pleasure field attached to Howard House School. The society was formed in 1848.

To aid the display, Mr. John Walker staged a very showy bank of hydrangeas, liliums, cactus and pompon dahlias, mixed with zonal geraniums and ferns. Mr. H. Pearce staged some nice orchids, including Cattleya Mendeli, C. Gaskelliana, Oncidium sphacelatum, Odontoglossum crispum, and Cypripedium Lawrencianum. The only other "extra" was three dozen tomatos from Mr. W. Smith, Crown Garden, Crendon, each fruit weighing from sixteen to twenty ounces; and it was stated that the vines from which these leviathans had been cut had each produced eight pounds of equally well-coloured fruit.

In the competition Mr. Johnson, Garsington Nurseries, was a large and successful exhibitor, his group for effect, single and double zonals, exotic and hardy [illegible] well merited the premier cards bestowed on them. The single specimens were—for greenhouse Mr. Johnson exhibited an immense specimen of the West Indian fern Nephrolepsis exaltata; Mr. Anstiss second with Hoya carnosa; while in the amateurs' section, a cream and green coleus was first, and an asparagus second. In the cut flower section, the dinner-table vases were very tasty, the first award going to a dwarf centre-piece and two side glasses filled with carnations and grasses; the second to taller pieces in which coreopsis, carnations, montbretia, plumbago, and gypsophila were deftly posed; the next best being an arrangement of sweet peas and gypsophila. The groups of six bouquets were good, the premier set being the work of a floral artist. The show of dahlias represented the cream of popular forms; Mr. Anstiss's first prize twenty-four were a well-balanced collection, his best being Thomas Anstiss, Mrs. Morgan, Grand Sultan, Colonist, Duke of Fife, Goldsmith, Hon. P. Wyndham, Henry Walton, James Crocker, Rev. J. B. M. Camm, David Saunders, Muriel Hobbs, Mrs. Anstiss, Gwendoline, Mrs. Foreman, T. J. Saltmarsh, Majestic, and Prince of Denmark; in the second prize collection there were several fine back-row blooms. Mr. Anstiss's twelve fancy dahlias contained some charming specimens.

Devices in flowers or vegetable substance have always been a feature at Thame show, and some of those who were experts in ancient days have passed away; still, the premier design on this occasion lacked nothing in artistic finish. The first prize subject chosen was "Where are you going, my pretty maid?"; the representation being a picture of Swiss scenery, with the hills and a cottage; oak bark slightly coloured with dark green mosses filling the hollows. The milkmaid, with her pail and stool, defiant and much annoyed, is in the act of making way for the impertinent squire to pass along the edge of a rush-fringed brook. The dresses were of George III. period, and formed of the petals of simple garden flowers, laid on plastic clay, the features needing the aid of ochreous tints. The milkmaid's dress was of white phlox with pink spots, the short overskirt, formed of blue clematis edged with double white geraniums, being gracefully lifted on one side to allow the squire to pass; around her shoulders was a white crossover of convolvulus, while a tiny rosebud (Homere) was fastened as a brooch. The squire's scarlet coat (nasturtium) had large pocket lappels and cuffs, his vest being of yellow sunflowers, and neckcloth of blue clematis; his cocked hat of purple maroon hollyhocks, stockings of the same; with breeches of the silvery foliage of Stachys lanata, whose silky tomentum would pass for plush. Mrs. Lightfoot secured the award for this design.

The show of fruit was not large, but there were a few choice exhibits in competition. There was only one collection of six dishes, which comprised a nice melon, peaches, apricots, gooseberries, red currants, and white grapes. The best peaches were Hales' Early and Alexandra Noblesse. Vegetables were a good all-round lot, the roots having attained a remarkable size for such a dry season. The carrot classes appear difficult to determine, as some good short kinds appear too much like intermediate, and the intermediate run close on the heels of the long forms. Onions were large and well ripened, the heaviest being those of Ailsa Craig type. Potatos were good, some of the kidney forms being of a wonderful size and handsome.

SHIRLEY GARDENERS' ASSOCIATION.

THE recent monthly meeting of this society was held at the Parish Room, Shirley, Southampton, when Mr. W. F. Mayoss presided over a rather small attendance of the members. J. H. Aldridge, Esq., M.D., gave a very useful and interesting lecture on "Farm and Garden Insects and Their Relation to Flowers and Fruit." The lecture was illustrated with lantern slides representing each insect dealt with, and added very much to the interest taken by the members, as it enabled them to trace out the life history of some of the most injurious pests. Mr. R. Beck assisted the lecturer with a number of beetles representing a stage of some of the above insects dealt with, and in a few remarks he made he contrasted the difference in the conduct of the American Bureau of Agriculture and our own Government Agricultural Department. A hearty vote of thanks was accorded the doctor at the close of the lecture, and votes of thanks were also given to the exhibitors and to the chairman.

MARKETS.

Covent Garden.

THERE are moderate supplies of fruit and a steady demand throughout. Vegetables continue to be plentiful, though peas and other kinds have shortened, owing to the dry weather.

FRUIT.—English apples, 3s. 6d. to 8s. 6d. per bushel; Ports, 4s. to 6s. per case; English grapes, 10d. to 2s. 6d. per lb.; Jersey, 9d. to 1s. 3d.; Belgium, 6d. per lb.; Denia, 5s. 6d to 8s. 6d. per barrel; plums, 2s. 6d. to 5s. per half-sieve; lemons, 10s. to 20s. per case; English melons, 9d. to 1s. 3d. each; Spanish, 4s. to 7s. per case; bananas, 5s. to 9s. per bunch; pineapples, 1s. 6d to 5s. each; French pears, 3s. 6d. to 7s. 6d. per case; Dutch, 2s. to 2s. 6d. per molly; greengages, 9d. to 1s. per box, 4s. to 7s. per half-sieve; green figs, 9d. to 1s. 6d.; peaches, 1s. to 6s.; nectarines, 2s. to 6s. per dozen; pickling walnuts, 4s. per bushel; cobnuts, 2s. 6d. to 3s. per 12 lbs.; English tomatos, 3d. to 4d.; Jersey, 2d. to 2½d. per lb.; French, 2s. to 3s. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 8s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; asters, 2s. to 12s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; pansies, 1s. to 2s.; pelargoniums (scarlet), 3s. to 5s. per dozen bunches; stephanotis, 1s. to 2s.; lily of the valley, 1s. to 1s. 6d.; white gladiolus, 6d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Mushrooms, 4s. to 5s.; garlic, 3s. to 4s. per 12 lbs.; English onions, 2s. to 3s. per dozen bunches; Valencia, 4s. 6d. to 6s.; Ports, 5s. to 6d. per case; eschallots, 10s. to 12s. per cwt.; celery, 10s. to 15s. per dozen rolls; turnips, 2s. to 3s.; carrots, 2s. to 2s. 6d.; mint, 2s. to 2s. 6d.; parsley, 1s. 6d. to 2s.; leeks, 1s. 6d. to 2s. per dozen bunches; endive, 1s. to 1s. 4d.; cucumbers, 1s. to 3s. 6d; cauliflowers, 1s. 6d. to 2s. 6d. per dozen; lettuce, 9d. to 1s. per score; cabbages, 4s. to [illegible]; beetroots, 2s. to 3s.; vegetable marrows, 3s. to 5s. per tally; peas, 2s. to 3s.; French beans, 3s. to 4s.; scarlet runners, 2s. 6d. to 3s. 6d. per bushel; potatos, [illegible] per ton.

Borough Potato Market.

Harvesting has been the cause of short supplies of potatos, but the present is a dull season and prices have not altered much. Beauty of Hebron, and Snowdrops, 4s. to 4s. 6d.; White Hebrons, Early Puritans, Sutton's Early Regents, Reading Giants, and Imperators, 3s. 6d. to 4s.; Black Lands, 3s. to 3s. 3d.

EAT, DRINK, AND BE MERRY.—That is all very well, and no doubt, in moderation, [illegible] and merriment are very good things. But can any one of us—even the best of [illegible] to be invariably moderate? No, indeed! We are all apt at times to go just a [illegible], and then come headaches and regrets. At such times we can appreciate a [illegible] who will stand by us and put us right; and such a friend we invariably find in [illegible]. They did not fail our fathers at similar crises, and they do not fail us. It is no [illegible] fact, that Holloway's Pills are a certain cure for headaches, biliousness, [illegible] trouble. [Advt.]

NEW BOOKS.

Practical Forestry. By CHARLES E. CURTIS, F.S.I. (Crosby Lockwood and Son, Stationers' Hall Court, London.) Price 3s. 6d.—The publication of the second edition of this excellent manual is the best possible proof that while the question of improved methods of forestry has not made any great advance since the first edition made its appearance, it is obtaining increased attention both from land owners and the governing bodies of agricultural colleges, and that the sound teaching of the author is highly appreciated. As indicated by its title the work is essentially practical, and in less than one hundred and fifty pages Mr. Curtis has succeeded in giving concise directions for the selection of soils and sites, laying out of land for plantations, preparation of the soil, for planting, drainage, the distribution of trees in plantations, the management of plantations, including thinning and pruning, and the several methods of sale. In justification of the views he holds with regard to the importance of forestry as a source of profit to the landowner the author directs attention, in his prefactory remarks, to the fact that our woods and plantations are not such a source of income as they might, and, indeed, should be. He further submits that if the same enterprise bestowed upon agricultural land in the expenditure of landlords' capital had been manifested in the expenditure of capital upon woodlands there would have been that proverbial second string when found. But few landlords, unhappily, have been able to meet these periods of depression by drawing upon their woods without injuring more or less the interests of their successors. And yet, as the author so well shows, where forestry has been carried out on proper lines the land has been capable of yielding an annual return equal, if not superior, to arable or pastoral land of somewhat similar quality, and with the advantage that the yield is available when wanted without a large annual expenditure, and without the risk arising from fluctuations and seasons. It has frequently happened that woodlands are drawn upon too heavily, with the result that the cutting down of too large a proportion of the trees to meet pressing demands has greatly reduced the beauty and wealth of the woods. What is necessary at the present time is the judicious planting of new areas and the preservation and improvement of those already in existence. To effect these highly desirable objects the aid of skilled foresters is necessary, and to obtain men who have been efficiently trained in the formation and management of woods and plantations must be the mainspring from which future success will arise. As so forcibly put by the author "Until the idea is exploded that any fool can plant a tree, there can be little hope of success." Probably of the several branches of culture arboriculture is the one that needs the most culture in the individual. He is not, as Mr. Curtis states, called upon to sow a crop which he will reap the following season, but to sow, tend, and judiciously thin a crop which is to stand through future generations. He must be acquainted with the principles of plant life, understand the nature of soils and their preparation for tree life, and be well acquainted with the various timber trees, that no difficulty may arise in selecting trees well adapted to the conditions of soil and climate that obtain in the district in which they are to be planted. Seeing how important it is that woods, like other parts of the estate, should be placed under the charge of men who are fully equipped for the duties they have to perform, it is regrettable to be told by the author that "a really sound forester or woodman is but occasionally found." There are, of course, many good men who have obtained the knowledge they possess by practice, but they are not the men to whom we must look for leaders in carrying out the improvements so essential to profitable results in arboriculture. There must be a combination of science and practice, and it is satisfactory to know that the principles and practice of forestry are more generally taught at agricultural colleges, and that in other directions encouragement is given to those who purpose engaging in the management of land as a source of income to acquire a theoretical and practical knowledge of arboriculture. Hence the interest in forestry is steadily but surely increasing, and it is, therefore, satisfactory that those who are engaged in the study of this branch of estate management should have at their command such an admirable text-book, and the satisfaction we feel is greatly enhanced by the knowledge that it is being taken full advantage of.

Tourist Guide to the Continent. Edited by PERCY LINDLEY. (G.E.R., 30, Fleet Street, E.C., and 2, Cockspur Street, W.) Price 6d.—Although this is the nineteenth edition of the handy and inexpensive guide book published by authority of the Great Eastern Railway, the accomplished editor, Mr. Percy Lindley, has been eminently successful in maintaining its freshness, as well as greatly enhancing its usefulness to the thousands who annually turn to it for information. This has been accomplished by the addition of new features and the embodiment of fresh information in the existing sections, and we accordingly have a guide book that is not only fresh and interesting, but thoroughly up to date. We have in these somewhat frequent editions a trustworthy indication of the ever-increasing popularity of the Hook of Holland and Antwerp routes for reaching the Continent, as the result of the remarkable enterprise shown by the Great Eastern Railway Company in the development of their Continental traffic. In the second half of the eighteenth century it was the fashion to travel viâ Harwich and Holland, and in this and some other fashions history is repeating itself, for the fashion in travel is again setting towards Holland. Nor is this at all surprising to those who have had much experience in travelling between this country and the Continent, for the company has a fleet of splendid steamers, and on either side the train connections have been so devised that the traveller is able to accomplish his journey with comfort and without loss of time. By this route travellers can dine in town, have a night's rest in the comfortably-fitted cabins, breakfast at the Hook, and reach towns four or five hundred miles distant in the course of the day. Mr. Lindley not only gives ample advice for the guidance of travellers, but he discourses pleasantly on the many objects of interest passed in journeying by rail through the countries reached by way of Harwich and the Hook of Holland, and the historical associations of the cities and towns visited. The "Tourist Guide" is indispensable to the traveller, and will be found exceedingly useful to those who may be desirous of learning something about North and South Germany, Norway, Denmark, Sweden, and Switzerland, beyond the information given in the various geographical and historical text-books.

Toogood's Calendar. By E. KEMP TOOGOOD. (Toogood and Sons, Southampton.) Price 6d.—This brochure is devoted to lists of plants and crops that may be planted and sown in each month of the year. Each monthly list is prefaced by hints as to the more important operations to be performed during each month. The tables and preparatory remarks may prove useful to the amateur as reminders of what he has to sow and plant.

Sutton's Dwarf Defiance Pea.—This fine culinary pea did remarkably well with us this season. From two rows sown on March 15 we picked the first lot on July 9, and continued gathering at intervals until the end of that month. The haulm grows about two feet high, and is covered from base to top with fair-sized pods full of deliciously flavoured peas. As some of your readers may not have grown this variety I venture to recommend a trial of it for 1899 as a second early variety.—THOMAS CUMMINGS, *Banbury*.

ANSWERS TO CORRESPONDENTS

Lilium auratum.—J. D., Skipton: See GARDENERS' MAGAZINE for July 30, 1898, p. 494; article entitled "Cure for the Lily Disease."

Failure with Grapes.—W. H., Middlesex: We are investigating the matter, and hope to reply next week; meanwhile, if you can send particulars as to general treatment, border, &c., we shall be glad if you will do so.

Columbines.—T. H. C., Hinckley: There is no reason why columbines should prove a nuisance when planted out in a garden. They do not spread or run like perennial sunflowers, but if allowed to ripen seed, and the seed is allowed to fall, then seedlings in some quantity may appear, but they can be easily removed by the hand or hoed down if not required.

Diseased Melon Roots.—Z. Y., Lymington: Your melons are succumbing to a very bad attack of eel-worm, and nothing can be done to cure or save them. See that the house or pit is thoroughly well cleansed, using paraffin and hot limewash freely during the process. Clear out all the soil and burn it, and next season see that the soil for melons or cucumbers is obtained from a new source.

Invention for Supporting Chrysanthemum Blooms.—G. P., Parkstone: So far as we can gather from the description and rough drawing sent us we do not think your invention possesses any value for the purpose indicated. We cannot, however, form a decided opinion as to its merits or demerits until we have seen one of the supports. If you send us a specimen of your invention it shall be dealt with in the usual way—it will be quite safe in our hands.

House for Tomatos.—H. G. S., Axminster: A span roofed house would be better than a lean-to. Choose the the S.E. aspect both because of its lighter and brighter position and its dryer situation than the other available site. Provided you have a good market for such subjects you could scarcely do better than utilise the house during the late months of the year for late chrysanthemums, as these in almost any colour sell at good prices; white and yellow varieties are generally most in demand. If you have good command of heat other subjects might be tried instead, such as Roman hyacinths, &c.

Grapes Shanking.—R. E. T., Milborne: The trouble with your grapes may be due to several causes, and is known as shanking. It may be that the vines have been overcropped for their strength; the roots may have penetrated a cold subsoil, or the border may be sour owing to bad drainage, or timely stopping may have been neglected, and then a wholesale removal of foliage and growth indulged in. These are the chief causes of disaster, and in all probability the border is the source of trouble. Make a thorough examination of this, and we will do our best to assist you on receiving full particulars.

Failure with Culinary Peas.—K. G., Hull: Very many have, like yourself, failed this season to bring their late crops of peas to perfection. The failure has been due chiefly to the long continued dry weather which invariably induces simultaneous attacks of thrips and mildew, and these between them soon cripple growth, cause the young pods to curl and fail, and spoil the appearance and fullness of more advanced pods. The remedy is heavy manuring previous to sowing, sowing in trenches, suitable varieties, plenty of water and liquid manure at the roots, and forcible syringings or washings with clean water—a little quassia extract may be added if necessary—towards the evenings of hot days.

Cinerarias Flagging.—E. S., Forest Hill: Probably the plants have been kept too close and moist instead of being supplied with abundance of cool, fresh air, and with water as necessary. The bases of the leaf stalks have quite damped in some cases, and as a result of the decay some tiny grubs are at work around the "collar" of the plant. Grow the plants less luxuriantly, affording them a cool, shady place with all the air possible. Remove a little of the soil away from the collar or stem, and search for the tiny whitish and worm like grubs; destroy these, and then rub and dust the affected part with flowers of sulphur. The sulphur should be applied after a watering, so that it may remain as long as possible to dry up and heal the wound.

Seedling Bedding Pelargonium.—T. N., Norwich: The trusses of flowers sent were very fine, and the individual blooms both large and shapely. The colour is good, very bright, and telling. If the seedling has a first-rate habit and is free flowering it should prove a most useful bedding variety. The best method of testing it is to stage a number of plants in first-rate condition at a meeting of the Royal Horticultural Society, also showing a plant of the variety that approaches it most nearly in colour, for comparison. Name the variety before exhibiting it, and if an award of merit is gained, no doubt some of the leading nurserymen will make you an offer for the stock. You might, of course, bring it to the notice of a nurseryman at once and save yourself further trouble by selling cheap.

Worms Among Chrysanthemum Roots.—A. M., Invernesshire: In the case of small worms that are not easily caught by turning the plant out of the pot, there are two good remedies to follow. One is to plunge the pot to rather more than half its depth in water heated to a temperature of 123 degrees Fahr.; this will send all the worms to the surface, where they may be caught and killed. Another method is to pour two gallons of water upon a pound of lime, stir well, and then let the mixture stand for a day and night to clear; stop the hole at the bottom of the pot with clay, and then apply the clear lime water until it rises almost to the surface of the soil; this will cause the worms to rise, when they may be captured. Do not remove the clay for a few hours, so as to make sure of an effectual clearance; afterwards remove the clay, and see that the drainage is perfectly clear.

Moss Curled Foliage on Chrysanthemums.—A. S., Lincoln: The peculiar curling and crisping of the foliage as shown in the specimens of Chrysanthemum Princess Victoria sent us is caused originally by excessive feeding with nitrogenous manures. Unfortunately this peculiarity is not confined to the variety in question, but may appear in any variety, though, judging from your letter, Princess Victoria is especially liable to produce stunted growth and moss curled leaves. It is a form of disease, brought about by the disorganisation of the plant tissues, following too abundant a supply of sulphate of ammonia or similar fertilizer. A most wonderful fact in connexion with "moss curling" is that the plague assumes the character of a variety, the peculiarities being continued for at least several generations, so that it is desirable not to propagate from affected plants. Not only do the internodes become shortened, the leaves curled, rolled, and crisped, and the buds advanced into tiny mossy branchlets, but no flowers are produced, or at most very miserable aborted ones. Several of our leading exhibitors have also come to the conclusion that the actual cause of disease is, as we have stated, over feeding. This bears out what we have for so many years contended, viz., that to prevent loss of, or weakened constitution in, varieties of chrysanthemums grown at high pressure for exhibition or market, it is necessary to propagate from naturally grown plants, if not every year, at least every second year. Many large growers and nurserymen now raise their stocks of chrysanthemums from plants that have been growing naturally, planted out in the open all the season, and not fed in any way. Of course in the case of new and high priced varieties this system cannot well be followed the first year, but as quickly as possible a naturally grown reserve stock should be created, as cuttings from these are vigorous, clean, and sturdy, while they subsequently respond more readily to high cultivation without collapsing. We shall be obliged by your sending us further specimens in as fresh a state as possible to the Kew address of the Editor.

Names of Plants.—F. H. M., Auchterarder: 2, Stenotaphrum americanum variegatum; 3, Physalis Alkekengi; 4, Helianthus rigidus; 5, Heliopsis scabra. See next week for others.

W. B., Folkestone: 1, Polygonum cuspidatum; 2, Rhus cotinus.

R. E. T., Milborne: Greenup's Pippin, known also as Yorkshire Beauty and Red Hawthornden.

Z. Y., Lymington: 1, Davallia Tyermanni; 2, Polypodium aureum; 3, probably a seedling form of Adiantum fragrantissimum; 4, a Pteris—send fertile frond; 5, Onychium japonicum.

G. S., Guildford: 1, Juniperus chinensis; 2, Retinospora plumosa; 3, Thuia gigantea (Lobbi); 4, a form of Cupressus Lawsoniana; 5, Hibiscus syriacus (Althæa frutex).

E. S., Forest Hill: Woodwardia radicans.

E. J. S., Chislehurst: 1, Biota aurea; 2, Biota orientalis; 3, Cupressus Lawsoniana; 4, C. Lawsoniana pendula; 5, Cyrtomium falcatum; 6, Polypodium aureum. The stocks were first-rate.

THE WEATHER DURING THE WEEK ENDING AUGUST 27, 1898.

Stations.	Temperature of the Air.				Rainfall.

The mean reading of the Barometer during the week at Greenwich was 29·89 inches, and that of the Thermometer 65°·4, the latter being 4°·5 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 8 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 45.1 hours. The measured rainfall amounted to 0·14 of an inch.

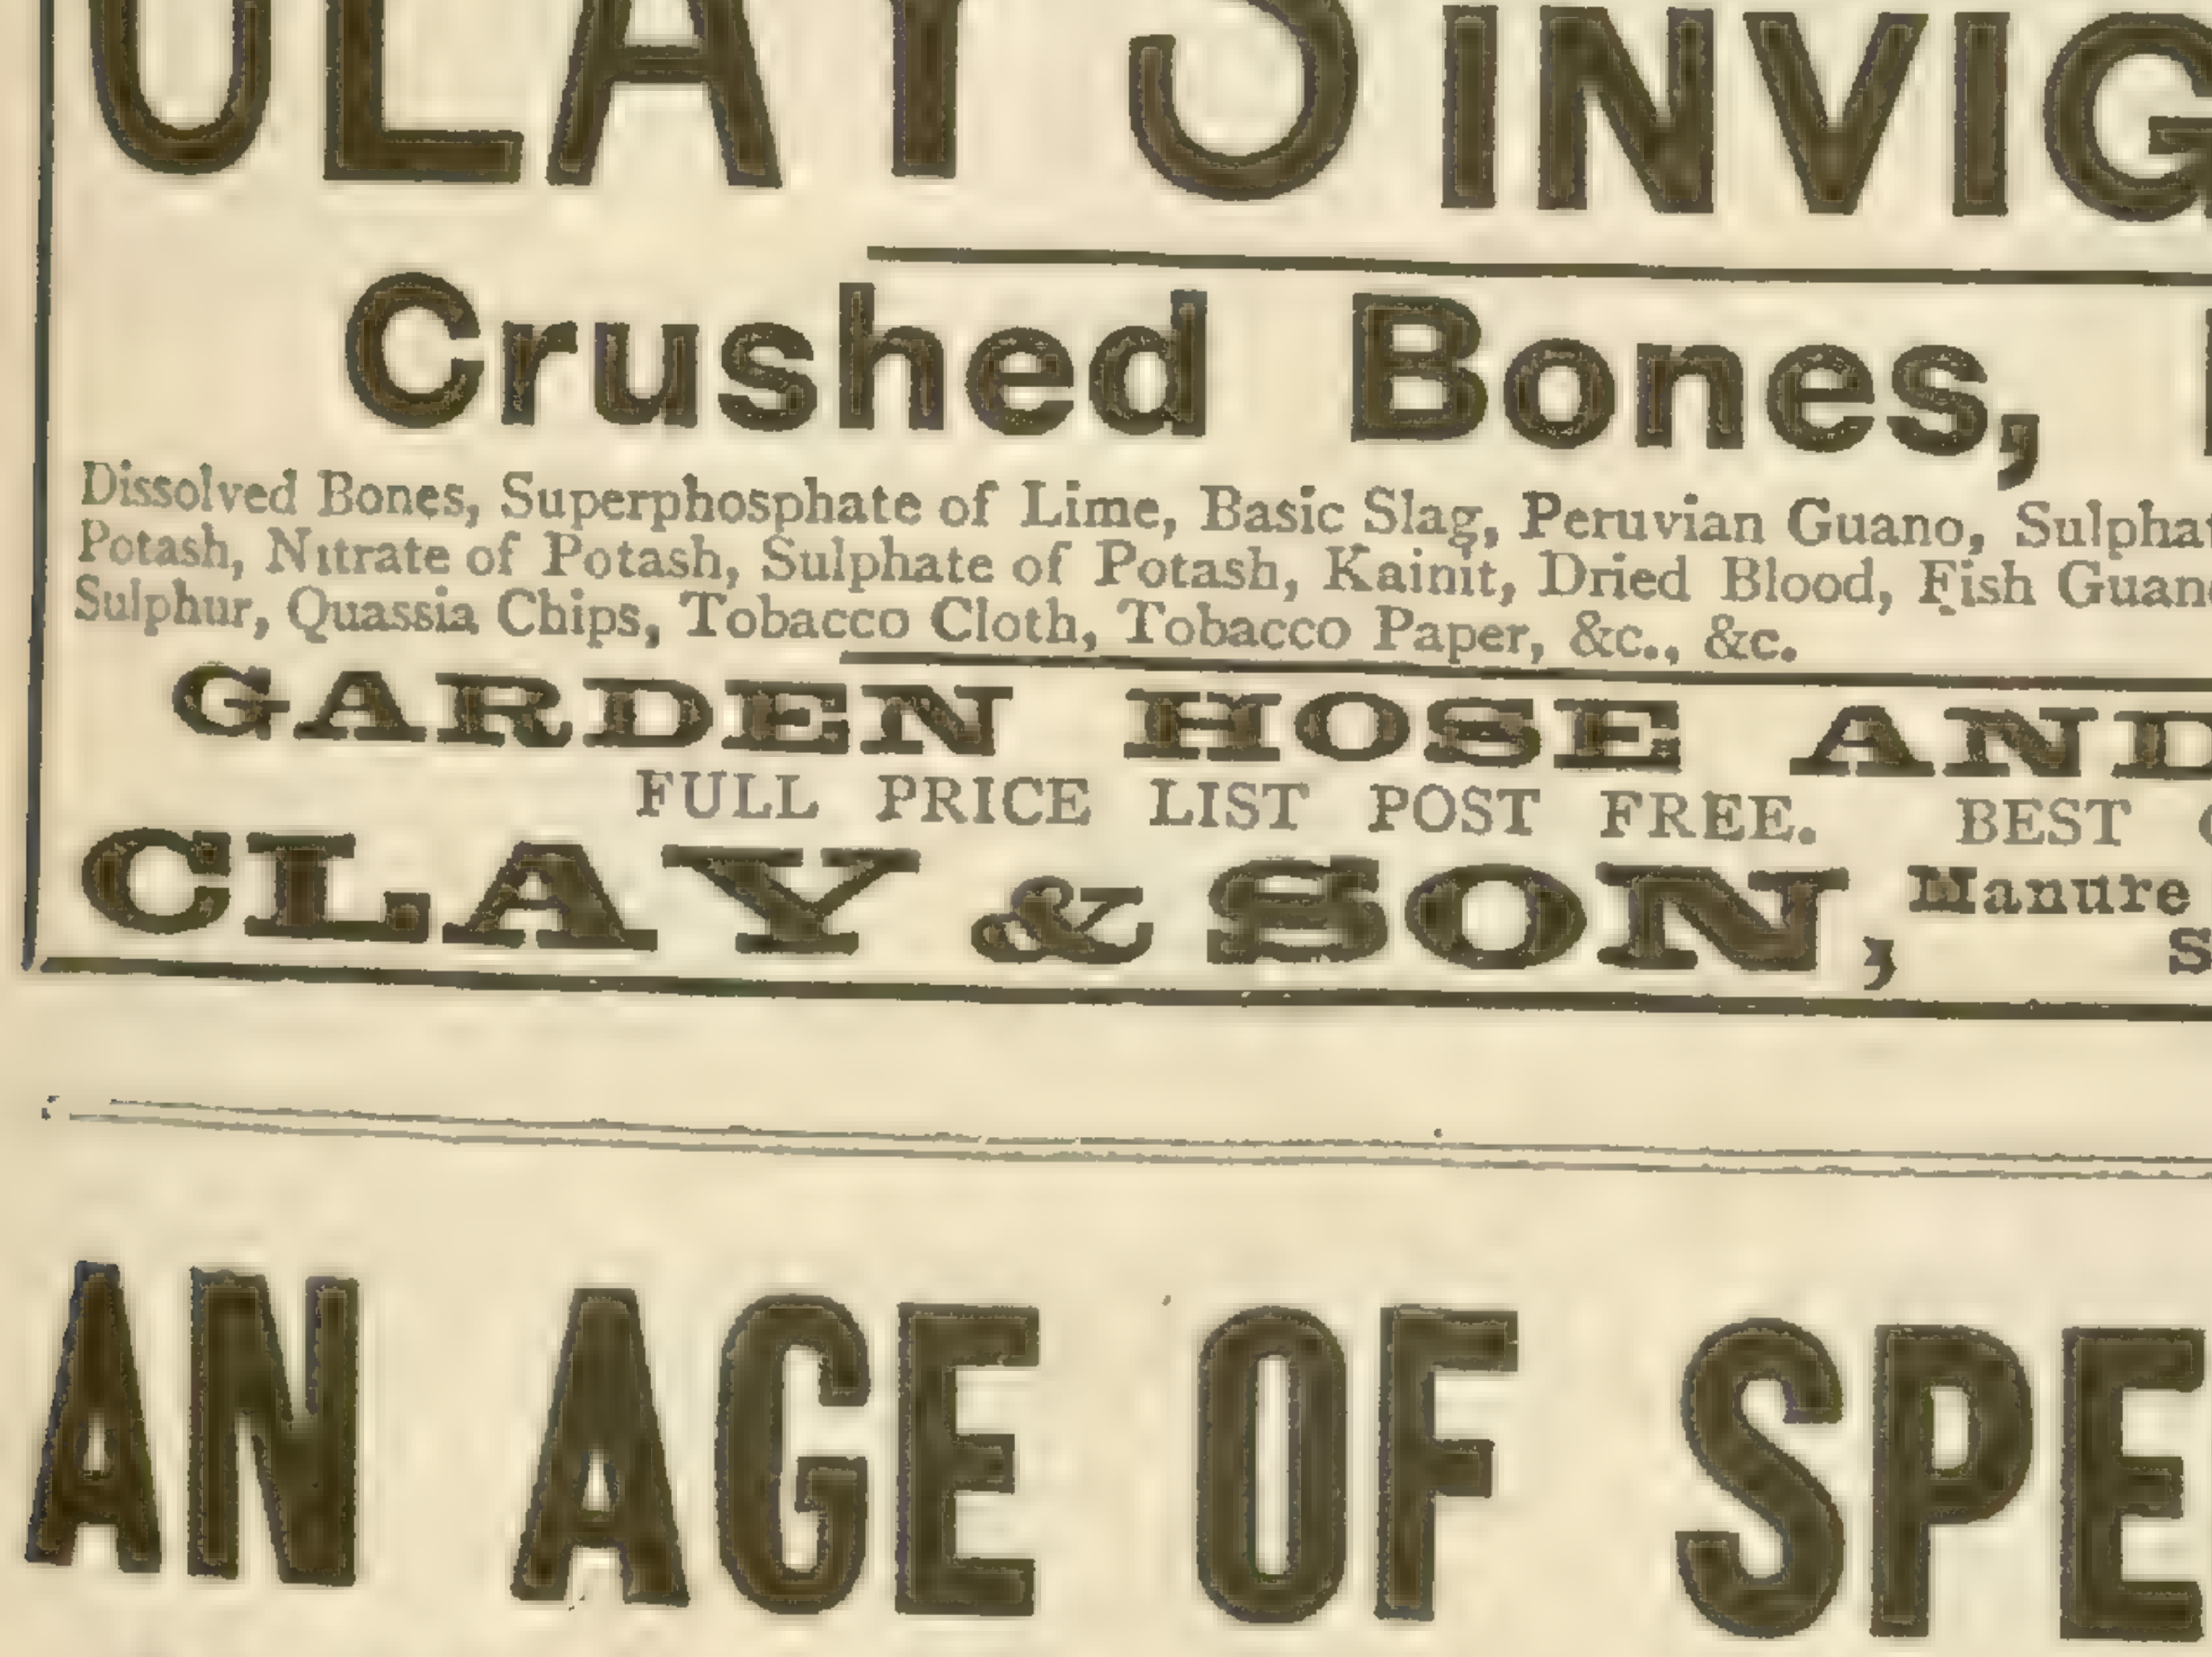
STRATFORD, LONDON, E.

AN AGE OF SPECIALISTS.

20,000 Trained Trees to Select from!

50,000 Apples on Paradise!

For considerably over a century our firm has been noted for the careful cultivation of Fruit Trees, and has built up a reputation by sending out Trees **TRUE TO NAME.** During the past Sixteen Years we have greatly **extended our culture of Fruit Trees,** and, having given up the cultivation of all General Nursery Stock in favour of these, and Roses, we may fairly claim to be **Fruit Tree Specialists.** To-day we are pushing the matter still closer, and make a Speciality (without neglecting other branches of Fruit Tree Culture) of



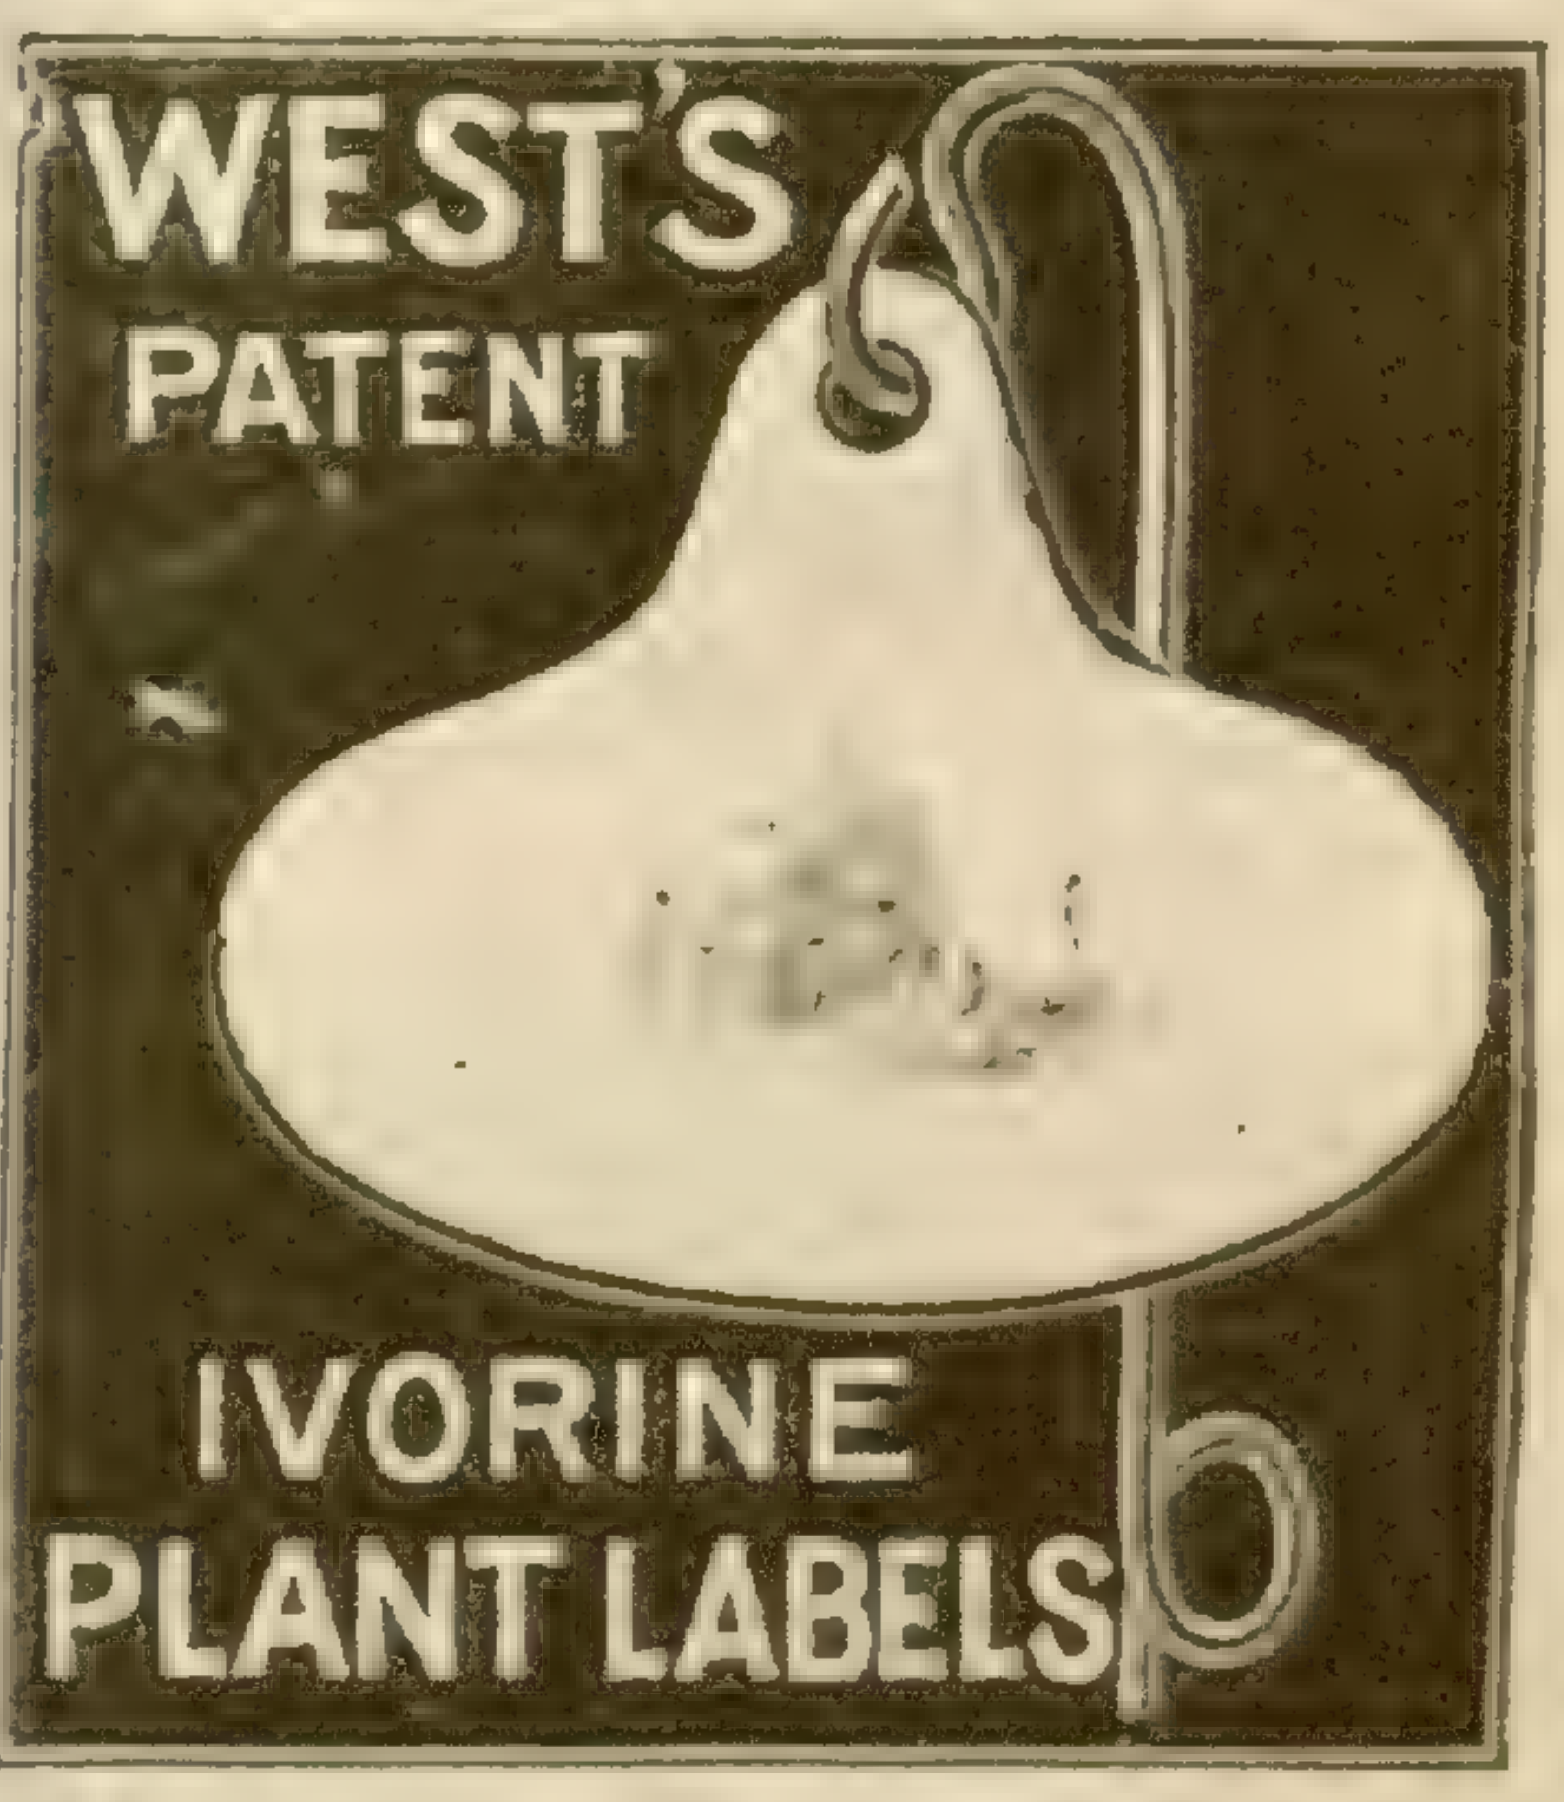
Photograph from Customer, of Trees planted the previous Autumn.

ESPALIER TRAINED TREES.

Last Season we had a **Stock of over 20,000,** a stock which for excellence or number we believe to be without parallel. We have **Apples, Pears,** and **Plums** trained in this form. **Peaches, Nectarines, Apricots, Cherries,** &c., as fan-trained Trees. We were the first to grow **Plums** as horizontally trained Trees, a method which suits them infinitely better than any other.

DESCRIPTIVE CATALOGUE, with article on Planting, Pruning &c., 6d.; Gratis to Customers.

J. R. PEARSON & SONS, CHILWELL NURSERIES, NOTTS.



THE "IVORINE WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Samples and Lists of the West's Patent Specialities post free. Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration, and wires 2 ins. longer from loop. (See List for other sizes). Special ink, if required, in **6d.** bottles, per post.

Supplied by all Nurserymen, Florists, &c.

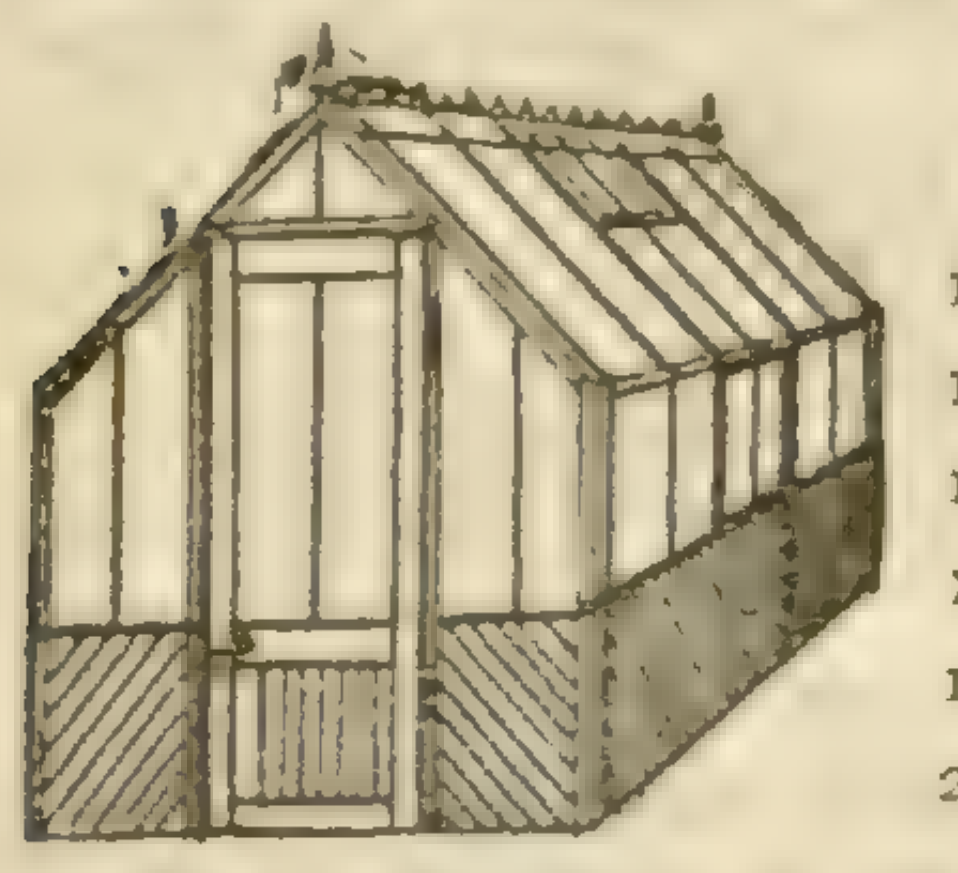
THOMAS RIVERS & SON,
Sawbridgeworth, Herts,
HARLOW STATION, G.E.R.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork: Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!



Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

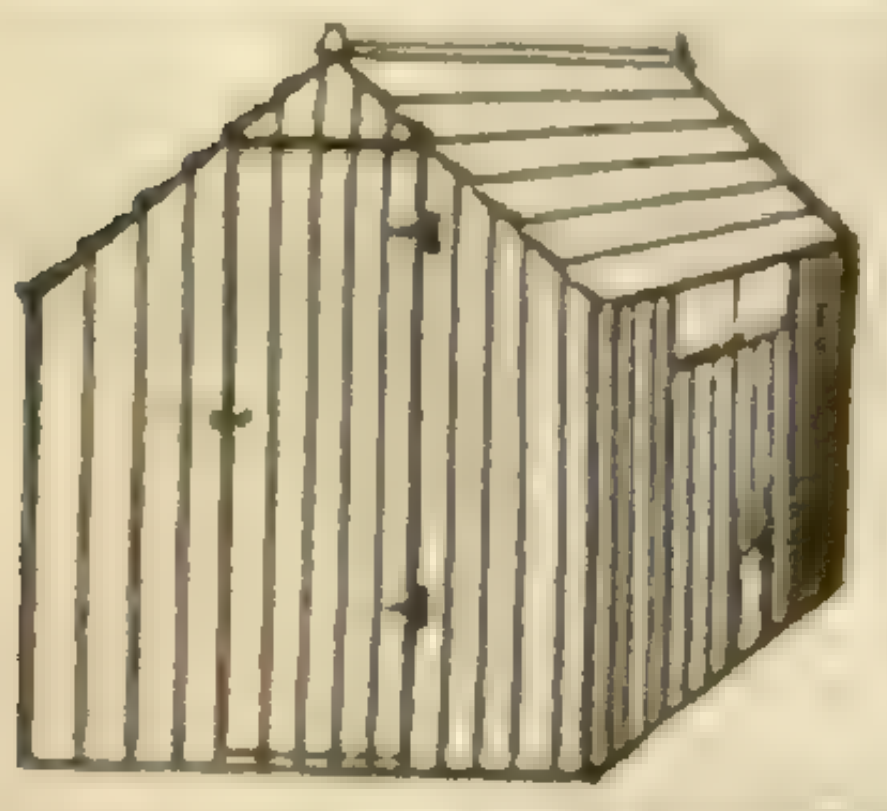
A comparison:—

£3/10/0 buys elsewhere 8 X 5 lightest possible make.

£3 12/6 buys from us 10 X 8 extra substantial make.

All sizes are in proportion. Need we say more.

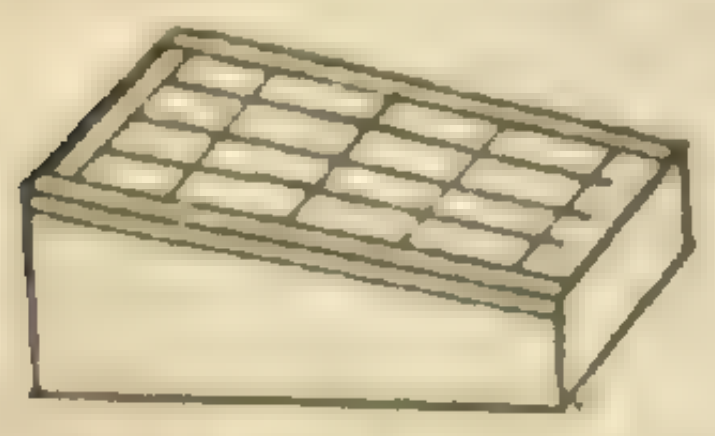
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.



4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

Apply for List to—

HYPOLITE, DEPTFORD.

SITUATION WANTED as Head Working Gardener, where two or three are kept; or good single handed with help; age 35; married; one girl, age twelve; twenty years' good practical experience, inside and out; excellent references.—D., Friars' Lodge, Matfield, Paddockwood, Kent.

SITUATION WANTED as good Single-handed Gardener; thorough experience in vines, melons, cucumbers, tomatos, and kitchen garden; excellent character from past situations; single.—Apply J. WOODS, Covers Road, Claygate, Surrey.

TO GARDENERS and FRUIT GROWERS. —WANTED, LODGING with Board for a few weeks for a young man recovering from illness, with opportunity of working in garden or fruit plantation, within fifty miles of London preferred.—Address, by letter only, wihh terms, to "GARDENER," care of Messrs. Charles Barker and Sons, 8, Birchin Lane, London, E.C.

TO NURSERYMEN.—Advertiser, age 19, SEEKS RE ENGAGEMENT, Inside or Out; state wages.—A. M., 20, Cambridge Avenue, Kilburn, N.W.

UNDER GARDENER, Inside and Out; life experience; good character from present employer; age 22; single; state wages.—E. STRACEY, Shrubs Hill, Sunningdale, Berks.

YOUNG MAN, age 23, SEEKS SITUATION as Second, where three or four are kept; six years' excellent character; abstainer.—Apply F. G., care of Mrs. J. Gray, Salisbury Street, Mere, Wilts.

YOUNG MAN, single, strong and willing, SEEKS SITUATION under good man, either in large or smaller place; leaving through no fault; Churchman.—H. C., Monkton, Taunton, Somerset

Situations Vacant.

Advertisements under this heading are charged 2s. 6d. for Four lines (32 words), and 6d. per line of eight words after.

SINGLE-HANDED GARDENER REQUIRED in small gentleman's place, one acre in all; must be thoroughly experienced in kitchen and flower garden; aged about 30; tall; married; willing to make himself useful; wages, 28s. per week; no cottage; good character indispensable. No answer will be entertained unless fullest particulars are given with it.—Mrs. MAYER, Lyminster House, East Grinstead, Sussex.

WANTED.—Strong, active young MAN as Garden Labourer, chiefly for pleasure ground; wage, 17s. per week.—Apply, with copy of testimonials, to H. W. BLAKE, gardener to the Earl of Onslow, Clandon Park, Guildford

WANTED.—GARDENER and Wife, without children; wife used to poultry; man must understand meteorological instruments and be generally very handy. —FRANKLIN, Machrihanish, N.B.

IMPORTANT NOTICE.

AN EMPLOYMENT REGISTRY DEPARTMENT IS CONDUCTED IN CONNEXION WITH THE "GARDENERS' MAGAZINE," AND THE CHARGE FOR AN ADVERTISEMENT ***INCLUDES A FREE ENTRY ON THE REGISTER FOR ONE MONTH.*** IF NOT SUITED AT THE END OF THAT TIME, AND IT IS DESIRED THAT A NAME SHOULD REMAIN, IT WILL BE CONTINUED FOR A FURTHER PERIOD UPON RECEIPT OF A REQUEST. IMMEDIATE NOTICE MUST BE GIVEN WHEN AN ENGAGEMENT IS SECURED.

A List of Gardeners on the Register will be supplied upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

JAS. VEITCH and SONS, Ltd.,

Are now booking orders for the following fine New Fruits, raised by them at their Langley Nursery :—

NEW STRAWBERRY—VEITCH'S PROLIFIC.

A strong growing and exceedingly prolific variety, raised from BRITISH QUEEN and EMPRESS OF INDIA. The fruits vary in shape from conic to coxcomb, attaining a large size, and ripening to the apex ; the skin is bright-scarlet, and the flesh whitish and firm with a pleasant crisp and luscious vinous flavour.

First-class Certificate from the Royal Horticultural Society, July 12, 1898.

Figured in the *Gardeners' Chronicle* of July 30.

Plants in small Pots, 42s. per 100 ; 6s per dozen. Runners, 21s. per 100 ; 3s. per dozen.

NEW GOOSEBERRIES.

LANGLEY BEAUTY.—A cross between YELLOW CHAMPAGNE and Railway. The berries are very large, of buff-yellow colour, somewhat hairy, and of delicious flavour. It combines the size of RAILWAY with the fine flavour and upright growth of YELLOW CHAMPAGNE.

First-class Certificate from the Royal Horticultural Society, July 28, 1896 ; *unanimous vote.*

LANGLEY GAGE.—A cross between PITMASTON GAGE and TELEGRAPH.—The berries are in size between medium and small, silvery white, transparent, and of very fine flavour ; an enormous bearer.

Award of Merit from the Royal Horticultural Society, July 28, 1896 ; *unanimous vote.*

GOLDEN GEM.—A cross between ANTAGONIST and WHITESMITH. The fruits are of a deep buff-yellow and very fine in flavour.

Award of Merit from the Royal Horticultural Society, August 10, 1897 ; *unanimous vote.*

Young plants, 3s. 6d. each ; the set of three, 9s.
A few trained, 7s. 6d. each ; the set of three, 21s.

THE GARDENERS' MAGAZINE.

SATURDAY, SEPTEMBER 10, 1898.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

ASSOCIATED PARK SUPERINTENDENTS.

THE greater appreciation on the part of the public of parks and gardens to which they can have free access, and the more enlightened views held by municipal authorities, have had the gratifying result of greatly increasing the number of open spaces in populous centres. How numerous are the parks and gardens belonging to the Government and local authorities is well shown in the list given in the *Gardening Year Book*, which is compiled and published in association with the GARDENERS' MAGAZINE, and its length can hardly fail to surprise those who have not, like ourselves, the opportunities of making observations in different parts of the United Kingdom. In the preparation of the list our chief objects were to give greater prominence to this important aspect of horticulture, and to facilitate correspondence between park and garden superintendents. To know that our objects have been attained, and that the directory has been the means of bringing superintendents in widely separated districts into close relationship with mutual advantage, is to us a source of great pleasure; for we have in no way changed in our views as to the importance of those engaged in the same pursuits taking counsel with each other. The directory has indeed surpassed our expectations, for it has not only proved useful in enabling superintendents to freely communicate with each other, but it has given rise to a desire for a still closer relationship, or, in other words, a desire for the formation of an association of park and garden superintendents. We are strongly opposed to the unnecessary multiplication of horticultural societies, but in this case the association would cover wholly new ground, and as it could not fail to possess a high degree of utility, it would have our warmest support. There has for many years past been an association of this description in America, and having regard to the support received, we may assume that it is highly appreciated by those in whose interest it was founded. The object of the association would be the dissemination of information to the members that is now difficult to obtain, and to enable the superintendents to meet together once a year at least. In America an annual congress is held, and by selecting a different centre each year the interest is maintained and a good attendance ensured. Here we have so many cities and towns with several parks that a long period would elapse before the list of important centres would be exhausted. At the annual conference there would necessarily be a meeting for the discussion of subjects of interest, visits to the parks and gardens in the districts, and various social functions, but as the cost of these would be borne by those attending the conference, a comparatively small annual subscription would suffice to meet the office expenses. How far it would be desirable to admit to membership horticulturists not engaged in park management is a matter that can be determined after it has been decided to form the society, but superintendents of cemeteries should, as a matter of course, have the right of enrolling their names on the list of members. These are matters of detail, and we would suggest that those interested should first determine whether an association of park superintendents is desirable or otherwise.

SEEDS.

WHEN we come to think of it, a seed is one of the greatest, though one of the most familiar marvels of Nature. We may purchase a packet of seed of some valuable flower, say, the auricula, and though, even with a lens, we shall find them all practically alike in appearance, yet as a result of sowing, we may get a batch of plants, the flowers of which will present the greatest diversity of form and colour, and even the leaves will probably have strong individual differences. All these differences are latent, but predetermined, not in the whole body of the seed, for that, small as it is, consists mainly of a store of nourishment, but in the embryo plant, which exists as a few microscopic cells at a definite point within the husk. In these cells, or rather in one of them, there has been a mingling of varied elements, derived not merely from two parents, but of a long ancestry. Many generations crossed and recrossed, have contributed their quota of influences to that tiny microscopic bag, and in some inscrutable fashion this mixed community has determined the eventual form and colour of flower and leaves, and also the constitution of the future plant. Each seed in a pod may vary in result if pollination has been left to insect agency, and it is not the least marvellous point in this connexion, that despite so much mixture, a *modus vivendi* is almost arrived at, though the cultivator may not approve of it when the prearranged flower appears. On the other hand he may be delighted to find that the little germinules have contrived a pleasing surprise for him in the shape of a novel and beautiful combination of which he then becomes as proud a possessor as if he had "worked the oracle" himself. There is, however, another wonderful aspect of seeds. We may take two of these vital grains, very similar in appearance, sow them side by side in the same pot and soil and give them identical treatment. Both consist merely of a husk, a store of intestive matter, and a microscopic embryo. No sooner, however, do these embryos begin to develop, than two widely different results ensue, the one becoming a deadly poison, each cell within it furnishing its quota of venom, while the other, from precisely the same materials, forms a nutritious food, and yet both shall belong to one family of plants, and their very flowers and fruits shall resemble each other. Thus the deadly nightshade breeds its belladonna, and its sisters, as the tomato and potato, it matters not which, become our table delicacies. What subtle chemistry must this be that can transform the same trifle of earthy salts and aerial gas into such opposite products as these. So much, or rather so little, for the wonders are infinite, for the inward potencies of seeds; then look at their diversity of form and fashion, their tricks for securing distribution, their varied receptacles, their range of size, from the microscopic seed of the tiny weed, to the huge double coker-nuts. Consider, then, the economical uses of seeds, our bread, beer, and very whiskey, are all dependent upon the supply of cereals, which, in some parts, are the sole food of millions. The theme, however, like Nature's store, is inexhaustible, and as space is limited, at any rate, in these columns, we must leave the rest to the imagination.

DECORATIVE ASPECT OF THE DAHLIA.

NOTWITHSTANDING the fact that the dahlia has been severely condemned at different periods of its history, on the ground of its being wanting in almost every attribute of beauty, by those unable to appreciate the charms of its shapely blooms, the flower has maintained its firm hold upon the affections of the flower-loving public, and at the present time, as so well exemplified by the two metropolitan exhibitions, enjoys a high degree of popularity. The dahlia has had its periods of depression, as well as times of jubilant progress; but throughout the hundred and odd years that have elapsed since the parent of the principal sections was introduced it has been held in the highest estimation by an important section of the community. This is all the more remarkable from the fact that the dahlia does not possess the attribute of fragrance, which is so highly appreciated in all classes of flowers, and that but little has been done by those responsible for the organisation of exhibitions to develop the decorative aspect of the several sections. The tendency of the competitive gatherings in the past has been rather to encourage a course of procedure which had the result of producing plants that certainly did not contribute to the attractions of the flower garden, and blooms useless for the adornment of the house. The majority of the committees of dahlia shows, and not a few writers, appear to have regarded the blooms of the dahlia as only suitable for the formation of long lines of colour, instead of being, as they unquestionably might be, of the highest value for enhancing the beauty of the garden and house; and we are impressed with the conviction that, with the wealth of material they now afford, strenuous efforts should be made to break from the traditions of the past. The National Dahlia Society has done something in this direction, but it has not as yet gone far enough, and although the competition in the decorative classes at the annual exhibition was, on the whole, somewhat unsatisfactory, we trust the executive will not be unduly discouraged thereby. The object in offering prizes should be to demonstrate the possibility of producing artistic effects in the garden and house, and not the encouragement of the cultivation of plants that can hardly be described otherwise than as unsightly, and the production of blooms so obese as to be unfitted for decorations. We greatly need improvements in methods of staging, more especially in the classes for show and fancy varieties, and it is especially desirable that some serious attempt should be made to break up the long lines that now characterise exhibitions of which these two sections form an important part. We are anxious to see a somewhat liberal use of vases in the staging of all the sections, and we are fully persuaded that exhibits consisting of from six to twelve vases, each containing a given number of blooms of one variety, would greatly enhance the attractions of exhibitions. Five or six blooms would suffice in the case of the show, fancy, and cactus varieties, while double that number would not be too many of the pompons and singles. As mentioned in our recent reference to the cactus varieties, the exhibitors of dahlias have, by staging blooms of several sections with a portion of the stem, effected a considerable improvement in dahlia displays, but something more artistic than these triangular arrangements is required. In commending this matter to those specially interested in these flowers we would assure them that the more tastefully the flowers are presented to public notice the greater will be the popularity enjoyed by their favourities.

Naming Fruits.—The immensely increased circulation of the GARDENERS' MAGAZINE has brought with it a proportionate increase in the number of fruits submitted for naming with the result that this part of our work has become very heavy during the autumn and winter. We therefore ask our readers to carefully observe the few conditions imposed upon those sending specimens, and this we do as much in their interest as in ours. In the first place we wish it to be distinctly understood that we are pleased to name fruits for our readers, and in return for services freely rendered without charge we would suggest that they send specimens that will admit of the identification of the varieties without special difficulty. It should be obvious that the specimens sent should be typical as to size, shape, and colour, and yet we annually receive hundreds of specimens that are either misshapen, imperfect, or in an advanced state of decay. A considerable number of the senders of fruit consider that fruits unfit for use are suitable for naming, thereby adding materially to our work of identifying them, or, in extreme cases, wasting their time and the cost of transmission through the post. What we wish to impress upon those who send apples and pears for naming is that they be of average size, with eye and stalk uninjured, and that both these fruits be sent when they are approaching maturity, as at this stage the skin will be of the colour characteristic of the variety. It is also important to place the name and address of the sender in the package, for if these are sent in a letter there is, when a dozen or so packages reach us by the same post, considerable difficulty in determining the senders of packages. We are also desirous it should be understood that although we deal as promptly as possible with specimens we cannot undertake to give the names in the issue of the same week as they are received. Therefore it is necessary senders should remember their nom de plume or initials and when they do not find the names in the current week's issue look for them in subsequent issues, instead of writing long letters, as is sometimes done, pointing out that the fruits they sent have not been named. We shall not for the present make any reduction in the number of specimens that may be sent at one time, and as we are desirous of assisting our readers to the fullest possible extent we hope they will carefully act upon the suggestions made, and thus render it unnecessary to make any change in the number.

Dr. D. Morris, C.M.G., lately assistant director of the Royal Gardens at Kew, has taken up as from the 1st inst. the position of Commissioner of Agriculture for the West Indies, to which he was appointed some time ago. He will preside over the new botanical department which has been constituted as a charge on the Imperial fund in accordance with the recommendation of the West Indian Royal Commission and the recent vote of the House of Commons. He leaves for Barbados on the 21st inst.

St. Petersburg International Horticultural Exhibition.—The Imperial Horticultural Society of Russia will celebrate its fortieth anniversary by holding an International Horticultural Exhibition at St. Petersburg in May next, and the programme has been issued. The schedule contains two hundred and ten classes, and these are arranged in seven groups, namely, new plants, with eleven classes; ornamental plants, with nineteen classes; plants for apartments, with thirteen classes; familes of plants, genera and species, to which one hundred and twenty-five classes are devoted; bouquets and floral arrangements, which have only three classes set apart for them; fruits and vegetables, with twenty-four classes, to be grown by the exhibitors; and technical objects, for which there are fifteen classes. The prizes offered in the several sections comprise objects of art, diplomas of honour, gold, silver, and bronze medals, and letters of thanks. Arrangements have been made by the Imperial Horticultural Society with the Russian railway and steamboat companies for the conveyance of objects to and from the exhibition at reduced rates. Mr. James H. Veitch has been appointed commissioner for Great Britain, and schedules and information generally may be obtained from him on application at the Royal Exotic Nursery, Chelsea.

Prospects of the Potato Crop.—Potato disease has made its appearance in the United Kingdom, but in few instances only has any material damage been done. This attack is in no way surprising, for the heavy rains that fell at intervals during August accompanied by much electrical disturbance of the atmosphere and an excessively high temperature have been favourable to the development of the fungus (*Phytophthora infestans*) by which the disease is caused. According to the reports received from our correspondents the disease has been the most destructive in Cornwall, Devon, Kent, Lincoln, and Norfolk, but in neither of these counties does the loss inflicted appear to be heavy. Other counties in which evidence of the attack of the disease has been found include Beds, Berks, Cambs, Chester, Cumberland, Essex, Gloucester, Hants, Hereford, Herts, Hunts, Lancaster, Leicester, Notts, Oxford, Somerset, Suffolk, Warwick, Westmorland, Worcester, and York. The attack has been very slight in Scotland, and the only counties from which we have received intimation of the presence of the disease are Aberdeen, Argyll, Ayr, Dumbarton, Forfar, Haddington, Lanark, Kirkcudbright, Renfew, Ross, and Sutherland. In Wales the crops in Anglesea, Brecon, Cardigan, Carnarvon, Denbigh, and Merioneth have been attacked, but without any material damage having been done. It will thus be seen that the possibilities of a general outbreak of disease exist; but at present there is no cause for grave apprehensions upon this point, as the dry weather accompanied by an easterly wind that is now being experienced over the greater part of Great Britain supply conditions unfavourable to the germination of the spores of the fungus and the consequent spread of the disease. In many districts the crop of potatos will be comparatively light in consequence of the growth being checked by the dry weather; but in the midland and northern counties of England and in Scotland, where the rainfall has been more abundant, there is promise of a heavy yield of potatos of high quality. Considering the great deficiency in the potato crop of last year it is highly gratifying to know that there is full justification for the growers anticipating this season a liberal return for their expenditure of time and money. It cannot be too generally known that potatos lifted when the skin has become set will keep satisfactorily for as long a period as will those remaining undug until the haulm has died down, and that in consequence the crop may be lifted on indications of an attack of disease. This, however, must be done carefully, and, if the weather is showery, with as little exposure of the tubers as possible, for if newly-dug tubers are allowed to lay on the surface for any length of time when the atmosphere is loaded with spores of the fungus a considerable proportion will be destroyed by the disease, as they readily germinate on the surface of the tuber and the mycelium quickly penetrates its tissues.

High Propagation of Potatos.—A reader of your magazine, Mr. Forbes, The Gardens, Regent House, Surbiton, very recently invited me to look in, writes Mr. A. Dean, and see a row of Carter's Snowball potatos he had raised from single eyes, taken from a couple of pounds of tubers (twelve potatos) received in the spring. Each eye was taken out ere it sprouted, with just a very small portion of flesh attached. There were seventy-six eyes in all. These were planted in a row of ninety feet length, near a greenhouse. The ground was dug deeply, and moderately manured, then a shallow drill was dug, and the sets planted being carefully covered up. Every one grew well, as I saw when looking along the rows. I have since heard from Mr. Forbes that my estimate of three bushels was materially exceeded by there being just two hundred and twenty pounds from the two pounds of seed, a very good result indeed. Of course, in this case there was none of that artificial propagation that characterised Mr. Forbes's practice in the famous Hooper competition.

Sobralia Cattleya, an orchid that has for long defied the persuasiveness of orchid growers, has just flowered in the Burford Lodge collection belonging to Sir Trevor Lawrence, Bart., and managed by Mr. W. H. White. One bloom appeared a few days ago, and was produced by a side growth and not at the apex of the tall reedy stems. It was a small flower, not so large as an example of S. virginalis; the colour was palest rose. So far as one can at present judge, Sobralia Cattleya is a poor plant, and has proved disappointing after so many years of patient waiting. In addition to the Burford Lodge plant there is a large specimen of this species at Kew, where it shows no inclination to flower as yet.

Approaching Marriage of Mr. James H. Veitch.—Considering how cordial are the relations existing between Messrs. James Veitch and Sons and their employés, it is in no way surprising the firm should have entertained the members of their large staff, in view of the approaching marriage of Mr. James H. Veitch, and thus have given them an opportunity of participating in the festivities associated with this interesting event. The other evening the staff was entertained at dinner at the Criterion Restaurant, and the guests, who included a few horticulturists, personal friends of members of the firm, numbered nearly one hundred. Mr. Harry J. Veitch presided, and it is hardly necessary to say that the wishes expressed by Mr. N. N. Sherwood that the forthcoming marriage would be a happy and prosperous one, were very heartily endorsed by the company. In acknowledging the toast of "Success to the firm of Veitch and Sons," Mr. J. H. Veitch gave expression to his gratitude for the gift of the silver tea and coffee service, presented to him by the gardeners of Great Britain and Ireland, and his appreciation of the handsome silver service he had received from the employés of the firm. Mr. A. Weeks, in proposing the health of the Chairman, spoke in warm terms of his personal qualities, and Mr. Veitch, in reply, said that he had every reason to be exceedingly proud of the firm's record. The best relations had always existed between the firm, the staff, and the men; and in proof of the assertion he stated that one good servant had been in their employ forty-three years; ten had served periods between thirty and forty years; and [illegible] between twenty and thirty years. Mr. Veitch submitted the health of the staff, and this was acknowledged by Messrs. Sedan, Heal, and Archer.

Artistic Grouping of Daffodils.—In the course of a lecture given before the National Amateur Gardeners' Association, Mr. W. J. Barr gave some excellent advice on planting daffodils with a view to produce an artistic effect. He suggested that in planting narcissi in the borders or naturalizing in woods, parks, &c, that straight lines and circular or symmetrical clumps should be avoided, the finest effect being always obtained by imitating Nature and massing together in irregular groups, and the arrangement of the stars in the heavens, he said, might well give us an object lesson of how to mass daffodils. It is always as well when massing to keep the various sections separate, and not mixed, the star narcissi or short cupped sections with the giant trumpeters. The simplest and most effectual method of planting in grass is to use a stout wooden dibber with a strong tread, make the hole in the ground about six or seven inches deep, fill up with a good mixture of prepared soil, consisting of old potting soil or two-thirds loam and one-third old leaf soil, and then press the bulb into this, covering the hole with some compost; this will give the bulbs a fair start, and success is sure to follow. In planting under large trees avoid places where the drip from the leaves, etc., is greatest, also where the main roots come close to the surface. Never plant when the ground is close and saturated with excessive rains, but wait until it is in a good friable condition; better far to plant later in ground which is in a proper condition than to plant earlier in ground which is in a bad condition. After freshly digging or trenching ground it should be left at least a week or ten days to subside before attempting to plant, or with the settling of the soil the bulbs will be carried below their proper depth, and failure may ensue.

Edinburgh Fruit Show.—The great autumn fruit show of the Royal Caledonian Horticultural Society to be held at Waverley Market, Edinburgh, on Wednesday and Thursday next, is expected to be better than usual; and Mr. Thomas, the Queen's gardener, has received Her Majesty's gracious permission to exhibit the Royal fruit at Edinburgh. It will be observed that the show is a week later than last year, and this is in favour of its greater success, as the season generally and its products in most places are fully a fortnight later than usual. The prizes for fruit, plants, flowers, and vegetables at this show amount to £366, the chief prizes being those contributed by the Lord Provost and Corporation of Edinburgh, for the best a most tastefully decorated table of dessert fruit ten feet long by four feet six inches wide.

The British Association.—The meeting of the British Association now being held at Bristol has the promise of proving one of the most successful of the annual gatherings of this important body, and the presidential address, in dealing fully with the question of the wheat supply and the maintenance of the fertility of the land, has rendered it more than usually interesting to those concerned with the affairs of the garden and farm. The formal inauguration of the meeting took place on Wednesday evening last at the People's Palace at eight o'clock, at which upwards of two thousand members were present. Sir John Evans having introduced Sir W. Crookes, that gentleman took the presidential chair, and proceeded to deliver his address.. In the first place the President discussed the question of food supply, pointing out that at present the United Kingdom grew only twenty-five per cent., and imported seventy-five per cent. of its annual consumption of wheat, and that two successive failures of the world's harvests, or a hostile combination of European nations might expose the population to imminent danger of starvation, while the constant increase in the number of bread-eaters and in the rate of consumption rendered it now almost impossible to secure any accumulations. After reviewing the sources of the present and possible wheat supply, and arguing that on the most favourable calculation they could not keep pace with the world's requirements beyond 1931, Sir W. Crookes said starvation might be averted through the laboratory. Wheat pre-eminently demanded as its "dominant" manure nitrogen in the form of ammonia or nitric acid. There were several available sources of fixed nitrogen, the chief of which—the treasure locked up in the sewage and drainage of towns—was at present to a great extent wasted. He estimated that fixed nitrogen to the value of £16,000,000 per annum was sent through our drains and water courses into the sea. The store of nitrogen in the atmosphere was practically unlimited, but it was fixed and rendered assimilable by plants only by cosmic processes of extreme slowness. The only available compound containing sufficient fixed nitrogen to be used on a world-wide scale as a nitrogenous manure was nitrate of soda, or Chile saltpetre. By increasing the present average wheat crop per acre from 12·7 to 20 bushels the supply would keep pace with the demand, and that could easily be done by dressing the soil with nitrate of soda. But the Chile supply, though great, was not inexhaustible, and the problem of the fixation of the unlimited supply of nitrogen contained in the atmosphere had not yet been solved. It was one of the great discoveries awaiting the ingenuity of chemists. He expressed the opinion that the solution might be found in the burning of the nitrogen in the air by means of a powerful electric current. At Niagara fixed nitrogen might in this way be produced at a cost of £5 per ton; the artificial production of nitrate was clearly within view, and by its aid the production of wheat might be brought up to thirty bushels per acre. In future generations, moreover, instead of trusting mainly to wheat, they would probably trust more and more to the exuberant foodstuffs of the tropics. Sir W. Crookes proceeded to review certain recent developments of science—low temperature researches, new gasses, wireless telegraphy, and Röntgen and allied rays, and his own investigation in spectroscopy, and in certain psychic phenomena, with regard to which he said he adhered to his already published statements, and might add much thereto.

Bush Hill Park Chrysanthemum Growers are evidently bestirring themselves on behalf of the flower in which they take special interest. Early in the year they formed a society, which has now fifty members, and the other evening they held a meeting to hear an address from Mr. W. H. Lees and bring together as many as possible of those interested in the promotion of the show to be held during the first week of November. Mr. Lees had a large audience, and in the course of his interesting address, referred to the good work done by the National Chrysanthemem Society in fostering and encouraging a more general cultivation of the chrysanthemum. He gave several useful hints which he thought might be of value to amateurs. He pointed out that it was unwise to feed plants too much, and advocated a regular and constant change in the material used for that purpose. Mr. Lees also said an excessive application of manure tended to poison the roots. Three days' consecutive use of one manure was, he considered, quite sufficient, and at the end of that time another kind should be tried. Lime water had been found very beneficial to the plants, especially at this time of the year.

The Pear Blister Mite has of late years spread so rapidly in some districts as to do considerable damage to the trees. The presence of the pest is indicated by blisters on the leaves, which were formerly attributed to some unknown fungus. It is hardly necessary to say the mites seriously diminish the vitality of the trees which they attack, and it will be readily understood that they often prevent them bearing a crop or diminish the size of the fruit. Mr. H. V. Theobald, of the Wye Agricultural College, has devoted a considerable share of attention to an [illegible] of the pest, and in the current issue of the College journal he [illegible] of his investigations. Mr. Theobald states in the course of his [illegible] the mite is taken in hand when it first appears, picking off the galled [illegible] back the trees well in winter, and burning the refuse, it may be [illegible]. But when once it obtains a strong hold, these measures are not sufficient, and then the spraying of the trees in winter with a dressing that will kill the mites in the buds, in which they hybernate, is the only effectual remedy. Three or four solutions are named as useful; but the mixture said to completely destroy the mites is prepared as follows: Boil 5 lb. of unslaked lime, 5 lb. liver of sulphur, and 5 gallons of water in an iron vessel for an hour. Dissolve in water 15 lb. of slaked lime, adding 5 lb. of common salt, and mixing these ingredients well. Then add the mixture to the lime and sulphur first mentioned, letting the whole boil for half an hour, adding 25 gallons of water with 2 lb. of soft soap dissolved in it. This mixture is sprayed through a coarse nozzle on to the trees, taking care to keep it well stirred during the process.

Changes in the Moorland Flora.—Central Europe, before man appeared within its borders, or while men were still few, little resembled the Europe which we know. Much of it was covered with woods, morasses or wastes, and inhabited by animals and plants, of which some ranged into the Arctic circle, others to the Mediterranean, Africa, and India. The worst lands of all—cold, wet, and wind-swept—had doubtless then, as now, the greatest proportion of Arctic species. But Professor Miall, F.R.S., in discussing the aspects of a Yorkshire moor, expressed the opinion that it is likely the passage from the bleak hills to the more fertile valleys and plains was not then so abrupt as at present. All was alike undrained and unenclosed; and what we know of the distribution of life in Pleistocene Europe shows us that a large proportion of our European plants are not restricted by Nature within narrow limits of latitude or climate. Species which are now isolated, at least in Central Europe, occupying moors or other special tracts, and surrounded by a population with which they have little in common, were formerly continuous over vast areas. In the early days of man in Europe, many plants which are now almost exclusively Arctic may well have ranged over nearly the whole of Europe. As men gradually rooted themselves in what are now the most populous countries of the world, the flora underwent sweeping changes. The forests were cleared, and trees of imported species planted here and there. The land was drained and fenced and tilled. During the long attack of man upon wild Nature, many plants are known to have perished altogether. Others have probably disappeared without notice. Useful plants have been introduced from ancient centres of civilisation, and common farm-weeds have managed to come in along with them. Many species of both kinds are southern, many eastern, none are Arctic. In our day the cultivated lands of Europe are largely occupied by southern or eastern forms, and the wastes appear by contrast with the imported population more Arctic than they really are. Even the wastes are shrinking visibly. The fens are nearly gone, and we shall soon have only a few scattered moors left to show what sort of vegetation covered a great part of Europe in the days of choked rivers and unfenced land. The moors themselves cannot resist the determined attack of civilised man, and thousands of acres which used to grow heather are now pastures or meadows.

Lily of the Valley Culture in Germany.—As the result of the ever increasing popularity of the flowers of the lily of the valley, the production of roots in Germany for forcing or retarding, according to the requirements of the cultivator, has undergone material extension of late years. The city of Hamburg has now become the most important centre of the lily of the valley culture in Germany, as for some purposes the roots are preferred to those produced in the environs of Berlin. The production of these roots appears to have been commenced in the vicinity of Berlin and Hamburg in the year 1856, and the industry proved so successful that in four years the annual output of roots at Hamburg was sixty thousand, and at Berlin, sixty-two thousand. In 1870 the lily of the valley had about one hundred and twenty acres devoted to it in the neighbourhood of Hamburg, and about one hundred acres near Berlin. At the present time it is estimated by Mr. W. Rund, of Wansbeck, near Hamburg, that the annual production of roots near that city amounts to between fifty and sixty millions annually, of an average value of twenty-four shillings per thousand.

Messrs. Wills and Segar's Plant Group.—The surpassingly beautiful group of flowering and ornamental leaved plants exhibited by Messrs. Wills and Segar, of Onslow Crescent, South Kensington, at the recent flower show at Brighton, not only received from the visitors much attention, but obtained for the firm the exceptional honour of a gold medal, which was awarded by the committee. This was the only medal of its class awarded on this occasion, and once only has a gold medal been given by the society since its foundation.

German Flower Industry.—The importations of cut flowers into Germany from Italy and the south of France have of late years assumed such large proportions that the German growers have become apprehensive as to their effect upon their trade. They accordingly asked the Government to impose a tax upon all cut flowers imported from abroad. But the interests of the growers and florists are not exactly the same, for while the former are anxious to obtain the highest possible prices for their flowers the latter are desirous of obtaining their supplies at a low rate. Consequently the floral decorators in the west of Germany had a meeting at Mayence a few days since, and decided by a large majority to protest against the imposition of a duty. It appears that in 1897 Germany imported from France five hundred and thirty-four tons of flowers of the value of £80,000, and from Italy the imports of flowers amounted to one thousand and two tons, of the value of £60,000.

Horticultural Excursion.—About fifty members of the Isle of Wight Horticultural Association will visit the Crawley district to-day (Saturday). The party will arrive at Three Bridges at fifty minutes past ten a.m., and proceed to Worth Park, the residence of Mrs. Montefiore, and after inspecting the gardens the members will be entertained at luncheon by Mrs. Montefiore. From Worth Park the party will drive to the Lowfield Nurseries, and after devoting two or three hours to an inspection of the many objects of interest in the establishment, Messrs. Cheal and Sons will entertain the party at tea. This will complete the programme, and the party will return from Crawley at six o'clock.

NEW PLANTS AND FLOWERS.

DAHLIAS.

Snowflake, a rather large flowered pompon, pure white, borne on stiff stems and of good form, F.C.C., N.D.S., September 2; F.C.C., N.C.S., September 6, Mr. F. W. Seale, Sevenoaks.

Claribel, a curious fancy pompon with creamy-white ground, shaded and edged with dark rose, F.C.C., N.D.S., September 2, Mr. C. Turner, Slough.

The Clown, a large flowered cactus form in the way of Arachne, having broad florets, soft scarlet, tipped white, F.C.C., N.D.S., September 2; F.C.C., N.C.S., September 6, Messrs. Keynes, Williams, and Co.

Countess of Londsdale, deep and rich salmon, suffused with rose; a good cactus form, F.C.C., N.D.S., September 2; F.C.C., N.C.S., September 6, Messrs. Keynes, Williams, and Co.

Antelope, one of the Fantasy cactus class with incurving tips to the florets; the colour is soft scarlet, tinged with rose, F.C.C., N.D.S., September 2, Messrs. Keynes, Williams, and Co.

Lucius is a large and handsome cactus form with clear and soft orange-coloured blooms, F.C.C., N.D.S., September 2; F.C.C., N.C.S., September 6, Messrs J. Burrell and Co., Cambridge.

Magnificent is a cactus variety with pale orange buff flowers suffused with rose; F.C.C., N.D.S., September 2; F.C.C., N.C.S., September 6, Mr. J. Stredwick.

Mrs. Holford is a very small flowered cactus variety, soft scarlet, shading to salmon rose at the tips of back florets; this has been designated a pompon-cactus, and will be useful for many purposes, F.C.C., N.D.S., September 2, Messrs. J. Cheal and Sons, Crawley.

Leslie Seale is a single variety with crimson centre and with the segments tipped with rosy lilac, F.C.C., N.D.S., September 2, Mr. F. V. Seale.

Eric is a very dwarf growing single dahlia with flowers of a curious old gold shade, tipped with a rosy suffusion and having a basal tinge of crimson, F.C.C., N.D.S., September 2, Mr. T. W. Girdlestone.

Daniel Johnson is a fine show variety with rich fawn-coloured flowers, the rosy reverse of the florets showing through; a quite new colour, F.C.C., N.D.S., September 2, Mr. G. Humphries.

Watchman is a bright fancy form with a yellow ground, heavily flaked and striped with blood red, F.C.C., N.D.S., September 2, Messrs. Keynes, Williams, and Co.

Tommy is a showy fancy single dahlia, golden, heavily flaked, and splashed and spotted with vivid scarlet, F.C.C., N.C.S., September 6, Mr. F. W. Girdlestone.

Royal Purple, a beautitiful cactus dahlia, of a rich and dark crimson purple shade, good form, F.C.C., N.C.S., September 6, Mr. G. Humphries, Chippenham.

Distinction, a deep rosy-purple pompon variety of good shape, F.C.C., N.C.S., September 6, Mr. F. W. Seale, Sevenoaks.

Demon, a bright crimson pompon variety; a distinct self, F.C.C., N.C.S., September 6, Mr. F. W. Seale.

Vicountess Sherbrooke, a large cactus variety; rich rosy orange, F.C.C., N.C.S., September 6, Messrs. Keynes, Williams, and Co., Salisbury.

The Duke, a neat pompon dahlia, deep and rich crimson, F.C.C., N.C.S., September 6, Messrs. Keynes, Williams, and Co.

Madeleine, a fancy pompon, yellow ground, with deep red-rose margins to the florets, F.C.C., N.C.S., September 6, Mr. C. Turner.

Columbine, a single variety with orange-yellow centre and rosy-orange apices. A.M., R.H.S., September 6; F.C.C., N.C.S., September 6. Mr. T. W. Girdlestone, Berkhamsted.

Puck, a bright and deep orange single variety, with crimson bases to the segments. A.M., R.H.S., September 6. Mr. T. W. Girdlestone.

Lorelie, a charming cactus dahlia with beautiful soft and yet bright rose outer segments, and with very pale and almost white central florets. A.M., R.H.S., September 6. Messrs. J. Cheal and Sons, Crawley.

Louisette, a pretty fancy single dahlia with rich rosy-crimson borders to the segments, almost surrounding the central rosy-blush area. F.C.C., N.C.S., September 6. Mr. T. W. Girdlestone.

Lady Rogers, a useful pompon variety, rather large but neat, and pure white. A.M., R.H.S., September 6. Mr. Leggett, gardener to Sir R. Hargreave Rogers, Bexley.

Mrs. Finlay Campbell, a very handsome orange-scarlet cactus variety of fine form and very neat. A.M., R.H.S., September 6. Messrs. J. Cheal and Sons, Crawley.

PERISTERIA ELATA.

A well-known orchid, and curiously enough, one that is seldom seen in perfection in what are known as orchid collections. It was introduced from Central America, and is a noble plant, having leaves three to four feet long and six or eight inches across at their widest part. The sturdy scapes and erect raceme reach a height of about five feet, and each carries from one to three dozen flowers that continue to expand over a period of two or three months. The blooms are very fleshy, rounded, all the sepals and petals being concave; the fleshy lip and broadly winged column provide a very fair representation of a dove, and this has given the plant the popular name of the Dove orchids. The flowers are waxy white, and powerfully scented, as in the case of an acineta. F.C.C., R.H.S., September 6, and silver Flora medal. Mr. Owen Thomas, gardener to Her Majesty the Queen, Windsor.

CATTLEYA ELLA.

A showy orchid, obtained by crossing C. Warscewiczi with C. bicolor. The growths are erect, and surmounted by a pair of thick recurving leaves. The flower is four and a quarter inches broad, and about the same length. The sepals are three quarters of an inch broad, and of a soft rosy hue; petals broader and waved, deeper and brighter rose, tinged with purple. Lip large, side lobes almost suppressed, and of a light purple shade; central lobe with a narrow neck and broad bi-lobed apex; colour rich royal purple, with a narrow rose purple margin. A.M., R.H.S., September 6. Messrs. J. Veitch and Sons, Chelsea.

DRACÆNA DUCHESS OF YORK.

An elegant narrow-leaved dracæna, admirably suited for use as a table plant. The lower leaves are deep bronzy green, and the younger ones pale green, with creamy-white margins and shadings, and also with rosy lines. A.M., R.H.S., September 6. Messrs. J. Veitch and Sons, Chelsea.

ACER NEGUNDO ELEGANS.

A splendid and handsome tree, with beautiful and elegant leafage, that in its younger state is coloured with a decidedly yellowish green in the shape of an irregular broad margin around a bright green centre. In the older leaves the yellow fades out and leaves a creamy-white hue. The growth is strong, and the stems are glaucous green. F.C.C., R.H.S, September 6. Messrs. Paul and Son, Cheshunt.

LOBELIA RIVIORE.

A handsome form of the cardinalis section, very strong in growth, and producing an abundance of very pale pink or blush coloured flowers that are of large size. A.M., R.H.S., September 6. Mr. Baines, gardener to Sir Trevor Lawrence, Bart., Dorking.

DENDROBIUM SANGUINEUM.

A curious species with slender growth that is prolonged from the apex of a slender and curious pseudo-bulb. The leaves are about three inches long, almost linear. The flowers are borne sparingly at the apex of growth, and are an inch and a-half across; the sepals and petals equal and spreading; deep Venetian red with pale creamy bases. Lip very small, front lobe slender, pointed, and deep red; side lobes small, pointed, and greenish. A.M., R.H.S., September 6. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart.

MELON BRITISH QUEEN.

A splendid melon of rather large size; very pale buff skin, with delicate creamy netting. It is a white fleshed variety of delicious flavour, and the result of crossing Hero of Lockinge with Royal Ascot. F.C.C., R.H.S., September 6. Mr. Owen Thomas, gardener to her Majesty the Queen, Frogmore, Windsor.

CHRYSANTHEMUMS.

May Mansa is a new early flowered seedling Japanese variety of good habit, flowering early in September on the natural break. Flowers about six inches across, creamy-white, turning to pure white. F.C.C., N.C.S., September 6th, Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

Louis Lemaire is a sport from M. Gustave Grunerwald, and as free and distinct as that form. The flowers are of a curious rosy-orange shade, though in some flowers there is more yellow than in others, very free and useful. F.C.C., N.C.S, September 6th, Mr. W. Wells, Earlswood Nurseries, Redhill.

TOMATO THE CHAMPION.

A very handsome, smooth, and rounded tomato; rich red in colour, very solid, and a free fruiter. F.C.C., N.C.S., September 6th. Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

WENTWORTH HOUSE.

THIS beautiful house is the seat of the Right Honourable Earl Fitzwilliam, K.G. It is situated some eight miles eastwards of Sheffield, and the gardens being about two miles distant from the Midland Railway Station of Wentworth, and Tankersley Station. This two miles is a most pleasant walk on a fine day, especially when the hay harvest is being gathered. The small village of Wentworth is a very clean one, considering there are several coal pits just round about it, and in working order.

On entering the park through one of the lodge gates, and proceeding by a winding drive, the entrance to the gardens is reached. Mr. Hughes ably presides over this large establishment, which has an extensive glass department, chiefly devoted to growing plants for home decoration. In the stoves there are some finely-coloured crotons and dracænas, with stephanotis trained under the roof, flowering most profusely. Fragrant flowers are quite a speciality, pancratiums and Eucharis amazonica being in splendid health, the former pushing up grand spikes of bloom at the time of my visit. Leaving the warmer houses for the conservatory, this structure is found to be quite gay with such things as cannas, hydrangeas, pelargoniums, and petunias, the latter being represented by a very striking form named Mrs. Sanders, bearing flowers of a bright rose colour, very free, and exquisitely scented. Other cool houses are filled with the popular Malmaison carnations, numbering some six or seven hundred plants, in six and eight inch pots, carrying immense blooms, the foliage quite free from that dreaded pest, the rust. Mr. Hughes uses a potting compost of turfy loam, leaf soil, and coarse sand, and keeps the plants somewhat dry during the winter months. There are several new varieties here, and one worthy of special mention is Lord Rosebery, dark rose-coloured petals, smooth, the flower being beautifully cupped and very sweet scented. The vines and peach trees carried good crops of fruit, especially the latter, which in one lean-to made a perfect show. Nectarines and figs were also doing very well. The second crop of melons, just ripening, bore large, handsomely-netted fruit, the most conspicuous variety among them being a seedling raised by Mr. Hughes many years ago.

The pleasure grounds at Wentworth are of gigantic proportions. The flower garden is laid out in the Italian style, bedded with geraniums and violas, altogether looking exceedingly gay. The carnation garden contains some three thousand plants, planted out in square beds. The greater portion of them are seedlings raised at Wentworth, and some are extremely strong and healthy. The palm stove contains some gigantic specimens of Seaforthia elegans, Kentia Balmoreana, and Areca lutescens, all in splendid health; these are used for the decoration of the State apartments; close by is a camellia house, where the specimens are planted out, most of them from thirty to forty feet [?] high and several yards through. In the same house there is a fine specimen of Dicksonia antarctica planted out, with a stem about fifteen feet high, the fronds covering a large amount of space. This house leads on to the terrace, which is a-quarter of a mile long, overlooking the splendid park, which is well timbered with oak, ash, and chestnuts. From the terrace the house is soon reached, and it is a most imposing structure, with a frontage of some six hundred yards. Coming from the house into a long avenue one soon reaches the Botanical Garden, where the plants are all arranged in their proper order, with a neatly written label to each one. This interesting garden has been renovated since Mr. Hughes took charge of the gardens some five or six years ago. The kitchen garden is on a very large scale, and every quarter is cropped to the best advantage; peas, runner and dwarf beans, and the Brassica family, all are in the most flourishing condition. Hardy fruits will be a fair crop. The aphis has been very troublesome on the wall trees. In one of the wall-fruit tree cases was a charming sweet pea, pure white, only two feet in height, and covered with large blooms, raised at Wentworth, and well worthy of a name.

T. W. H.

Leaves From A Rambler's Note-Book.

"THE TROUBLES OF A CONSERVATORY."

There are times when a man feels proud that he is a gardener, not altogether because it is an honourable calling, but rather for the reason that he is in a position to be of assistance to his fellow-men. Somehow you feel a sense of your own importance when an inexperienced acquaintance suddenly acquires a taste for the gentle art in an amateur sort of a way, and comes to you for advice and assistance. You give it him, of course, and, try how you will, it is almost against human nature to keep back the air of patronage that will assert itself. He is an exceptional type of human nature who at such moments does not experience a feeling of superiority in the possession of knowledge above that of those around him. If by any favourable stroke of fortune the seeker of information has more than a spasmodic taste for gardening, and turns the knowledge gained to good account, modest indeed is the man who in his heart of hearts does not take a share of the credit unto himself for the information given. Unfortunately, however, it is not always a matter of satisfaction to the receiver and honour to the donor of information relative to gardening matters, the success of which must be ruled to a great extent by circumstances and conditions. The advice may be sound, but the conditions unfavourable, and the inexperienced amateur who has placed implicit faith in his gardening friend, and is satisfied that he has followed his instructions to the letter, loses faith in his teacher, becomes disgusted with his own efforts, and eventually gives up the whole thing as a failure. Instances of this kind are most numerous in cases where men are unfortunate enough to become possessors of an ornamental conservatory.

I say unfortunate, and qualify the expression by adding that to the amateur gardener a conservatory attached to his dwelling is either a source of pleasure to him, or else a disappointment, and eventually a nuisance—very often the latter. A little glasshouse adornment attached to a suburban residence carries with it a charm and attraction to would-be tenants, and has been the means of letting many a residence. Much as your town dweller prizes the bit of garden that does much to induce him to take the house, he has even a greater weakness for the little conservatory, which he sees in his mind's eye aglow with bright flowers. Alas for human hopes! The inexperienced individual fancies that, once in possession of the greenhouse, all is plain sailing, and never for a moment considers whether the structure is suitable for the welfare of plants, or otherwise. That is either a matter he knows nothing about, or else it is only a detail, and subsequent experience has to teach its lesson. Everyone knows the amount of pleasure that is derived by many from the little conservatory, but it is only so in cases where the architect knew something of horticulture, or else, by an extraordinary stroke of good fortune, the conservatory was fixed in a favourable position to catch the light and sunshine without anyone being in the least degree aware of it. The idea of the architect is, of course, to make the outline of his building as attractive as possible. The conservatory is, no doubt, an acquisition towards adornment, but it never for a moment occurs to the man of lines and angles that the most important use of the structure is to grow plants in, and, therefore, this should be the first consideration. Elegance in outline, with a display of ornamental ironwork, is all very well, so far as it goes, and does credit to the builder; but if householders are to have conservatories, let them have such structures that are suitable for plants.

Perhaps in no hobby have so many petty worries and difficulties to be overcome as in gardening. They may be, and are, mastered by many, but others faint by the way, and become discouraged by force of adverse circumstances. There is something sublimely innocent about the pride in which the townsman views the smart conservatory attached to his modern suburban residence. It does a great deal to hide the defects of the speculative builder perhaps, and whether it has a position under the shade of the surrounding walls, where sunshine is unknown, or whether placed in the glare of every ray that presents itself, matters little at the outset. The new occupier is proud of it, and lays his plans as to what he shall grow in it; his wife is perhaps prouder still, as a residence with a conservatory attached is distinctly genteel, and no doubt the proudest members of the family are his daughters, who consider that the combination of glass and timber opening out from the drawing-room will materially elevate their social position, and besides, it will be so nice to be always able to have your own plants for the table, and go out and cut your own flowers for the rooms. If the building is of the right sort, and the advice of the gardening friend is sound, well and good, and like the good people in the story books, all are happy ever after. But if, on the other hand, the conservatory is of the common villa residence order, there will be trouble in store for that family. The florist supplies sturdy plants, which in a few weeks are leafless and spindling, the professional adviser is called in, but can do nothing, as he cannot make light and sunshine. In winter there is trouble with the heating apparatus, sometimes the structure and half the dwelling-house is full of smoke, and the mercury in the thermometer rises to 80 degrees, and then falls below freezing point in the most erratic manner. Conservatory bills become appalling, but there is an end to human patience, and eventually the very mention of that glass house becomes a thorn in the side of the once enthusiastic householder.

I am going a step further; from the conservatory of the suburban residence to that attached to the more pretentious mansion where the gardens are in charge of a staff of experienced hands, and yet where the conservatory is the offending thorn. I do not know whether one is justified in laying the whole blame at the door of the architect, but it is nevertheless a fact that many conservatories attached to mansions are entirely unsuitable for the welfare of plants, and the gardener's greatest difficulty is that of keeping the conspicuous structure gay with flowers, and his greatest trouble is that every plant he puts there in robust health is conducted from thence to the rubbish heap, or else has to undergo a period of hospital treatment before it is again presentable. Through experience I know something of conservatory troubles, gained in the gardens of a princely establishment where the mansion is supposed to be a masterpiece of architectural skill. The same may be said of the conservatory, looking at it entirely from an architect's point of view, but seen through the orbs of a gardener, knowing the requirements of plant life, it sinks into an ocean of adverse criticism. The conservatory referred to is a handsome structure, with a framework of iron and ridges highly ornamented. Its cost must have been enormous, but I fancy the first consideration at the time of building was to form a connecting link between the rooms on either side of the mansion. This resulted in its being closed in, and to make it effective plants had to be staged in a sloping manner towards the tiled pathway running through the centre. Being crowded together and a long way from the glass, all chances of sturdy growth were done away with, and plants after adorning the conservatory for a short time presented a pitiable appearance. The quantity taken regularly for the purpose was a continual strain on the rest of the glass department, and results were altogether unsatisfactory.

Many gardeners suffer from conservatory troubles where the conditions are similar to the instance quoted. The place is a source of worry, and how to keep it bright and attractive is an ever-perplexing question. It is heartrending to a good gardener to see plants that have taken time and care come back from the conservatory in a sickly, unhealthy condition, and the question that naturally occurs to him is, What shall he grow for the purpose? The answer is nearly as obvious, viz., something that may be dispensed with after flowering. At the fall of the year there comes the indispensable chrysanthemum, that fills so many offices at a time when flowers are scarce. In the spring the gardener has to rely principally on the inmates of the forcing-houses, and for the summer there is a host of useful flowering plants warranted to make bright the dullest conservatory ever erected. The other day I was in a conservatory of the non-growing order, and was struck with the happy combination of plants that filled it. On every available bit of ironwork on the roof, and so trained as to obscure the light as little as possible, rambled Cobæa scandens, and conspicuous among the plants staged on either side of the walk were Humea elegans, Campanula pyramidalis (blue and white), Lilium auratum, tall fuchsias, and Valotta purpurea. The humea is a fine plant for conservatory decoration in the summer and autumn, and, when well grown (it is rather a difficult plant to succeed with), its drooping, feathery plumes lend themselves admirably to effective arrangement, and they form a pleasing contrast to the plants associated with it. It is questionable whether the spiked campanula is grown as a pot plant as much as its qualifications merit. No plant is cultivated more easily or flowers more freely, and I know of no more telling specimen for conservatory adornment than blue and white campanulas each throwing up three or four tall spikes, and clothed with bell-shaped flowers. The varieties grown by Mr. Wythes at Syon House are a decided improvement on the older forms. Little need be said of the liliums and Scarborough lilies, and the specimen fuchsias require no great skill in cultivation. "My aim is," said the gardener, "to keep up a succession of plants that practically finish their career when they have done flowering. This conservatory is warranted to spoil anything of a tender character, but there are plants sufficient to keep it bright that are either done with or go to rest after flowering." Surely this is the right course to pursue where the house-attached conservatory is concerned.

H.

Horticulture in the Isle of Wight.

It may be interesting to many of your readers to know that amateur and cottage gardening is developing with great rapidity in the Garden Isle. It is undoubtedly conclusively proved, by the keen and friendly rivalry which is conspicuous at the Island village shows, that to develop cottage gardening the more local these exhibitions the better; for the inhabitants take a greater pride in defeating one another than in defeating an exhibitor they do not know, and who comes from a village or town ten or twenty miles away. Large exhibitions like Shrewsbury, York, &c., may meet the wants of professional gardeners, and form a standard of excellence for all gardeners to aim at, and therefore should be supported liberally. But for the improvement of rural districts, the larger the number of village shows the greater the stimulus to the people. In the Garden Isle, with a population of about eighty thousand, in round figures, there are twenty flower shows, which are spread over all parts of the Island. The average number of classes is about sixty-five, the average number of entries three hundred, and the average number of exhibitors about fifty, which means there are a thousand people directly interested in the Island shows, and the majority of these are amateurs and cottagers.

The Whippingham Cottage Garden Society held its first exhibition on August 9. The entries were numerous, and the exhibits of first-rate quality. The show was held in the Rectory grounds, and was favoured by the presence of the Royal Lady of the Manor—Her Majesty the Queen—also Princess Henry of Battenberg (Governor of the Island), Princess Victoria of Schleswig-Holstein, and the Duke and Duchess of Connaught. The show was a great success, and augurs well for the development of gardening in the Royal parish. With great success school gardening is taught at Whippingham schools under the head mistress (Miss Thomas). The principal prize winners were Messrs. H. Flux, C. Cook, W. Snow, G. Snow, F. Russell, H. Kellaway, A. Flux, C. Street, H. Cooper, G. Butcher, F. Miles, J. E. Harvey, J. Wheeler, H. Hunt, J. Roach, and L. Smith; the principal lady exhibitors were Miss Thomas, Mrs. Wooldridge, Miss Stevens, Miss White, and Miss Roach. The judges were Messrs. C. Orchard, F.R.H.S., and W. Hills, of East Cowes Castle.

S. H.

CHRYSANTHEMUMS.

PECULIARITIES OF CERTAIN VARIETIES.

THERE is, to most of us, a certain sense of consolation in the knowledge that the various weaknesses and peculiarities of many chrysanthemums are common to almost all cultivators. We are apt sometimes to fancy that we have found a special trouble amongst our plants that will be pretty sure to upset our chances of success, but on finding that other people experience precisely the same difficulties, our hopes revive and new interest is awakened in overcoming, as far as possible, whatever may be amiss.

One of the most perplexing weaknesses is that to which Madame Carnot and its sports are subject, viz., that of losing some of their leaves immediately below the "break," at the period when new shoots are just getting away. One might advance several theories as to the probable cause, all of which would appear reasonable enough, but as far as our observation takes us, we are not able to offer with confidence any one of these as the sole agent of the evil. Apparently the trouble is a constitutional peculiarity arising from some cause or weakness inherent in the plants, and over which it seems impossible to exercise control. Generally speaking, the after consequences are not so disastrous as might be expected, many leaves which become pale in colour regain their normal green in a marked degree where the plants are well cared for. It is remarkable that when the bud which is "taken" about the third week in August appears no loss of leaves occurs as in the previous cases of the break buds forming. This may suggest that the young shoots which are selected to grow on the early breaks absorb such a large quantity of sap that the leaves immediately below suffer in consequence, and that the reason no loss occurs when the flower bud is taken, is because this bud does not make such a demand on the energies of the plant as does the young growth.

The only other variety which is at all affected in this way is Madame Ad Chatin; this sort occasionally loses one or two leaves below the break. However, the fact remains, that highly manured plants suffer as well as those grown moderately, and as I have before remarked, we all are liable to the same experience, so the worry is less, and the chances of overcoming the weakness so much the greater.

Australian Gold is very subject to the "scorching" of the points of its shoots during July. I have seen plants in several places during the season injured in this way, and sometimes so badly that the plant has been rendered useless, but usually only the edges of the young leaves suffer, and the flower bud comes on in due course. The reason is most probably found in having the shoots moistened during hot sunshine. A. H. Wood and Eva Knowles sometimes lose their foliage in a curious manner, and never recover a healthy growth. We have had plants of these apparently in perfect health suddenly commence losing leaves, the extremities shrivelling and dying back. The first named loses its leaves after the three shoots have been selected, commencing above the break, but with Eva Knowles the loss commences on the main stem and continues upwards as growth proceeds.

The pale colour of the foliage of plants of Dorothy Shea need cause no alarm; it never has very dark leaves, though if very pale it shows a lack of feeding; the plant is a free rooter, and will require ample support. Many growers have a difficulty in growing E. Molyneux satisfactorily, in consequence of its leaves curling and refusing to develop. This generally arises from mistaken attentions in the early part of the summer, and when once plants assume this condition it is impossible to induce them to make a satisfactory growth. The variety is impatient of much water until it has become well rooted, nor should manure be very liberally employed in the soil. Any check imposed in this way contributes to the collapse of the plant, and once a faulty root action is engendered the case is hopeless. Charles Shrimpton and one or two others are sometimes affected in a similar manner, but if grown carefully they are very robust.

A weakness which will be observed as autumn advances in Simplicity, Ella Curtis, Chenon de Lêche, and perhaps one or two more, is the decaying of foliage here and there, usually in large spots near the extremity of the leaf. This arises through too much moisture in the atmosphere, and is aggravated by a too moist condition of the roots. Blindness in some varieties is caused through over strong growing. Jeanne d'Arc, Brookleigh Gem, J. Agate. and Mdlle. Therese Rey often fail to produce proper flower buds when grown in large pots and freely manured. The remedy is obvious, though with the tendency inherent we cannot escape entirely and ensure every shoot producing its proper flower. President Borel usually becomes pale in leaf at this time of the year; it is a free-rooting variety, but is easily over-watered. Thomas Wilkins also is often ruined in the same way; it is an excellent grower, but once give it a check at the root and the plant seldom recovers.

I may caution growers once more against over manuring their plants. To keep feeding moderately and in accordance with the condition of the plants is all very well, but beware of over dosing, or damping will be one of the inevitable results. Colonel Smith, William Seward, Mrs. F. A. Bevan, G. C. Schwabe, and Mdlle. Therese Rey are very susceptible to this, and require very moderate supplies of manure at the present time.

The various forms of Queen of England have a peculiar habit of forming an abnormal cluster of sucker growths round the base of the stem. It is not always wise to remove this, as in doing so many roots are likely to be broken. If, however, the growths can be removed without any serious damage to the roots, by all means break them out, as they certainly impose a slight check on top growth, as do all the basal shoots.

Trent Park Gardens.

W. H. LEES.

SETTING AND COLOURING OF MUSCAT OF ALEXANDRIA GRAPE.

THE Muscat of Alexandria grape is, without doubt, the best white variety in cultivation, and yet, in spite of its being so, we very rarely indeed see what might be honestly termed a really fine crop, comparing it with other varieties. In truth, what is looked upon as a good crop of this variety would, in the case of others, be considered a very meagre one. Good crops, however, of this muscat have been grown, and they prove that such a thing is possible; therefore, no grower should feel satisfied until he has triumphed in producing a yield equal in every respect to those of his Black Hamburgh, Gros Colman, and Alicante. Strong healthy shoots, with dark-green foliage of good substance, are sure indications that the roots of the vine are in the right soil, and that the treatment, so far, is correct. It is when the flowers open and fail to set satisfactorily that the first intimation of a something wrong is apparent. A high temperature and dry atmosphere seem to have no effect in averting the misfortune. If the vines happen to be vigorous, large bunches—from fifteen to eighteen inches long—will only set a few berries. The worst sets, too, will be found where the bunches are most exposed to the sun.

Had gardeners been familiar with structural botany years ago, and brought the knowledge it imparts to bear on the cultivation of this grape, they might have been able earlier to understand the bad setting peculiarity of the vine. A knowledge of the cause would have enabled them to direct attention in the most likely channel to find a remedy. If we examine the flowers of this muscat grape minutely every day from the time they open, it will be observed that immediately the anthers part company they are ready to drop, and a very little disturbance of the canes will effect their release. It will also be noticed that, although there is any amount of pollen, yet only a very limited number of the grains attach to the stigma and grow. Being conversant with these facts should induce us to avoid shaking the canes roughly in an attempt to distribute the pollen. It will also be observed that many of the stigmas are coated with the grains, and still a set is not effected. Now, this is where botany comes to our aid, and points out that the stigmas are not ripe, and that the flowers are protandrous, *i.e.*, the anthers are ripe before the stigmas. Having made this discovery some years ago, I employed foreign pollen for the purpose of fertilizing the Muscat, and with every success, but as my supply was limited, I determined to try and effect the same results by other easier and simpler means. Some might say, why not run the hand over the bunches of other varieties rich in pollen and throw over the Muscats? To this remark I would answer that the method is too crude a one to be recommended, for even supposing it possible to transfer the pollen in this manner, any grains which may have become attached are likely to be knocked off the next time the hand passes over the bunch. So far as the supplying of foreign pollen is concerned, the better plan will be found in cutting off the superfluous bunches of Alicantes, carrying them carefully, and then shaking them over the Muscats. It is advisable in the first instance, however, to reduce the Muscat bunches to one to a lateral, or even to what would be required to form a crop. The easier and simpler method of attaining good sets is by shading. Some years ago I had two bunches of about equal size growing on the same vine, and on laterals of apparently the same strength. One of these bunches I shaded with tissue paper, and well exposed the other to the sun. The shaded one set like a Black Hamburgh, whereas the one exposed only set about a dozen berries. Since then I have continued to coat the outside of the glass with thin lime wash just before the vines come into flower, and have never had the least difficulty in securing sets equal to those of any free-setting variety. Besides putting on the shading, I soak the vine border at the same time with water containing a small percentage of nitrate of soda, and at a temperature of 90 degrees. The lime wash is gradually removed by rains, so that by the time the colouring period is reached it is practically all gone.

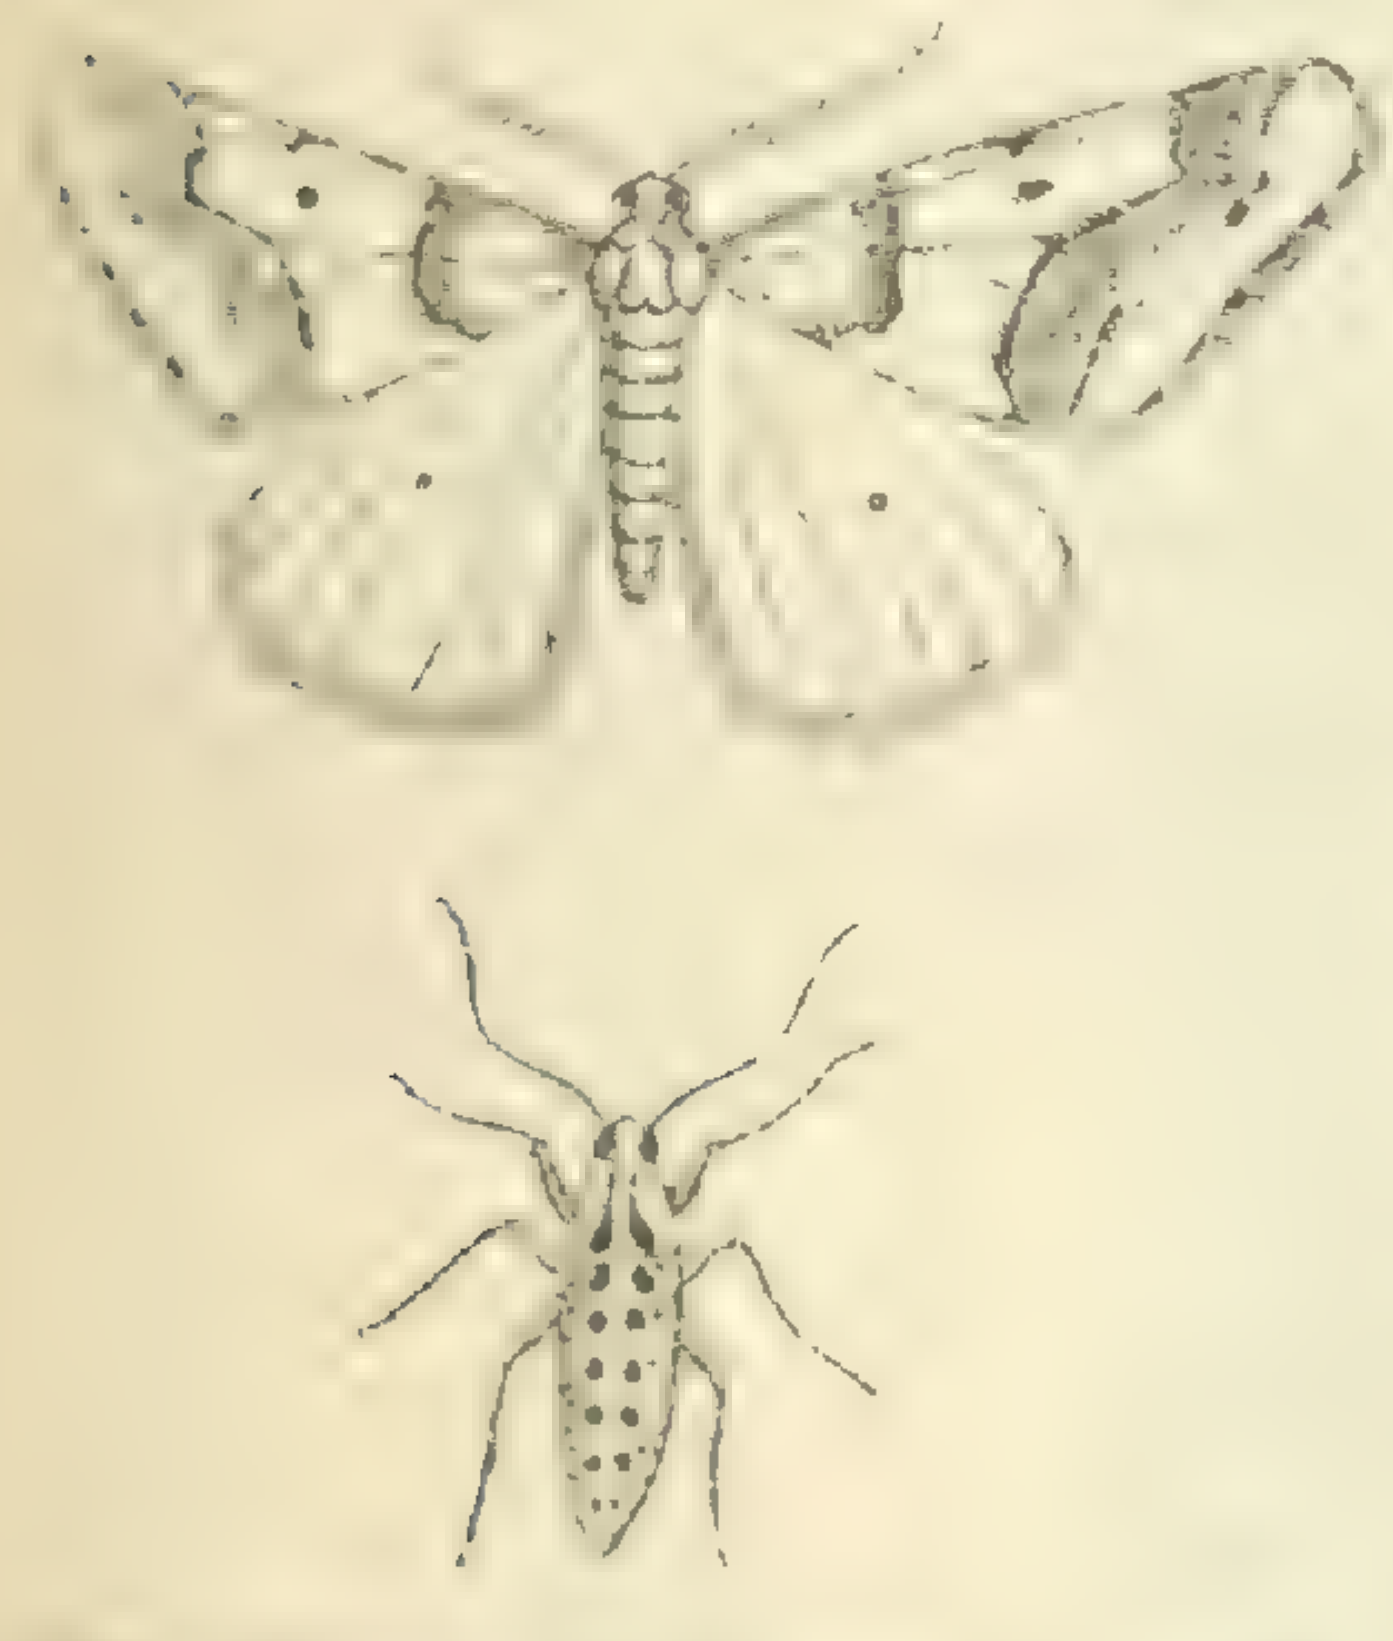
The next difficulty to be met with in connection with the growth of this grape is in colouring it. During the last sixteen years I have tried many things recommended, but one and all with the same indifferent success. In warm, dry weather some berries, occasionally even a bunch, would finish well, but, generally, they retained their greenish hue. In practice abundance of air is advised after the fruit shows signs of colouring, but remembering the exceptionally fine finished muscats where I once lived, and the conditions under which they grew, induced me to alter my course of treatment during the colouring period. In order to bring it into harmony with the one which obtained when the Muscats coloured well, I had to close the ventilators at the usual time in the afternoon, and otherwise treat them as if they were simply swelling their fruits. They were supplied with warm water at their roots, the same as when they commenced flowering. Under this treatment every berry in the house took on a beautiful amber colour, and this, too, in much less time than that usually given to trying to colour them. The success which attended my efforts in finishing Muscat of Alexandria grapes in this manner induced me to continue the practice, and, after three years' unvaried results I would now strongly recommend its adoption to those readers of the MAGAZINE who are interested in the successful growth and finish of this grape.

Of course, such treatment—the shutting-up process, I mean—as above recommended for Muscats would be detrimental to the finishing of black varieties, therefore, White Muscats associated with other white varieties only should be treated in the manner described. In the case of houses containing both black and white grapes, where the white varieties have all been kept to one end and the black to the other, the ventilators might be shut for the whites and remain open for the blacks. A little ingenuity in matters of this kind often contributes largely to the success which follows in the walk of intelligent enterprise.

J. RIDDELL.

ALLIES OF THE WINTER MOTH.

The caterpillars of several other moths, besides those of the Winter Moth, cause harm to apple trees in the spring, when the leaves and blossoms are forming. In some seasons, when there is a bad attack, as many as four distinct species of caterpillars have been found devouring the foliage and bloom, in company with those of Cheimatobia brumata. These last are considerably smaller than the other species found with them, and differ in colour from them, except perhaps in the case of the caterpillars of Anisopteryx æscularia, though the green colour of these is more vivid than that of the Winter Moth caterpillars, and they are, besides, easily distinguished by their greater size and different shape. The four species found in the company of the Winter Moth are the Mottled Umber or Great Winter Moth (*Hybernia defoliaria*), the Scarce Umber (*Hybernia aurantiaria*), the Pale Brindled Beauty (*Phygalia pilosaria*), and the March Moth (*Anisopteryx æscularia*). According to the Board of Agriculture, in its journal, there are two other moths whose caterpillars have been seen on apple trees in the spring, the Belted Beauty (*Nyssia zonaria*) and the Small Brindled Beauty (*Nyssia hispidaria*), but these are comparatively rare, and need not be described. The males of all these species of moth are winged, and are bright and attractive in colour, while the females are dull coloured and wingless, or have mere rudimentary wings. The females crawl up fruit trees and other trees, and fruit bushes, and deposit eggs on the bark or twigs, from which caterpillars come in the early spring, just as the leaves shoot and the blossoms form.



Great Winter or Mottled Umber Moth.
(Winged Male and Wingless Female)

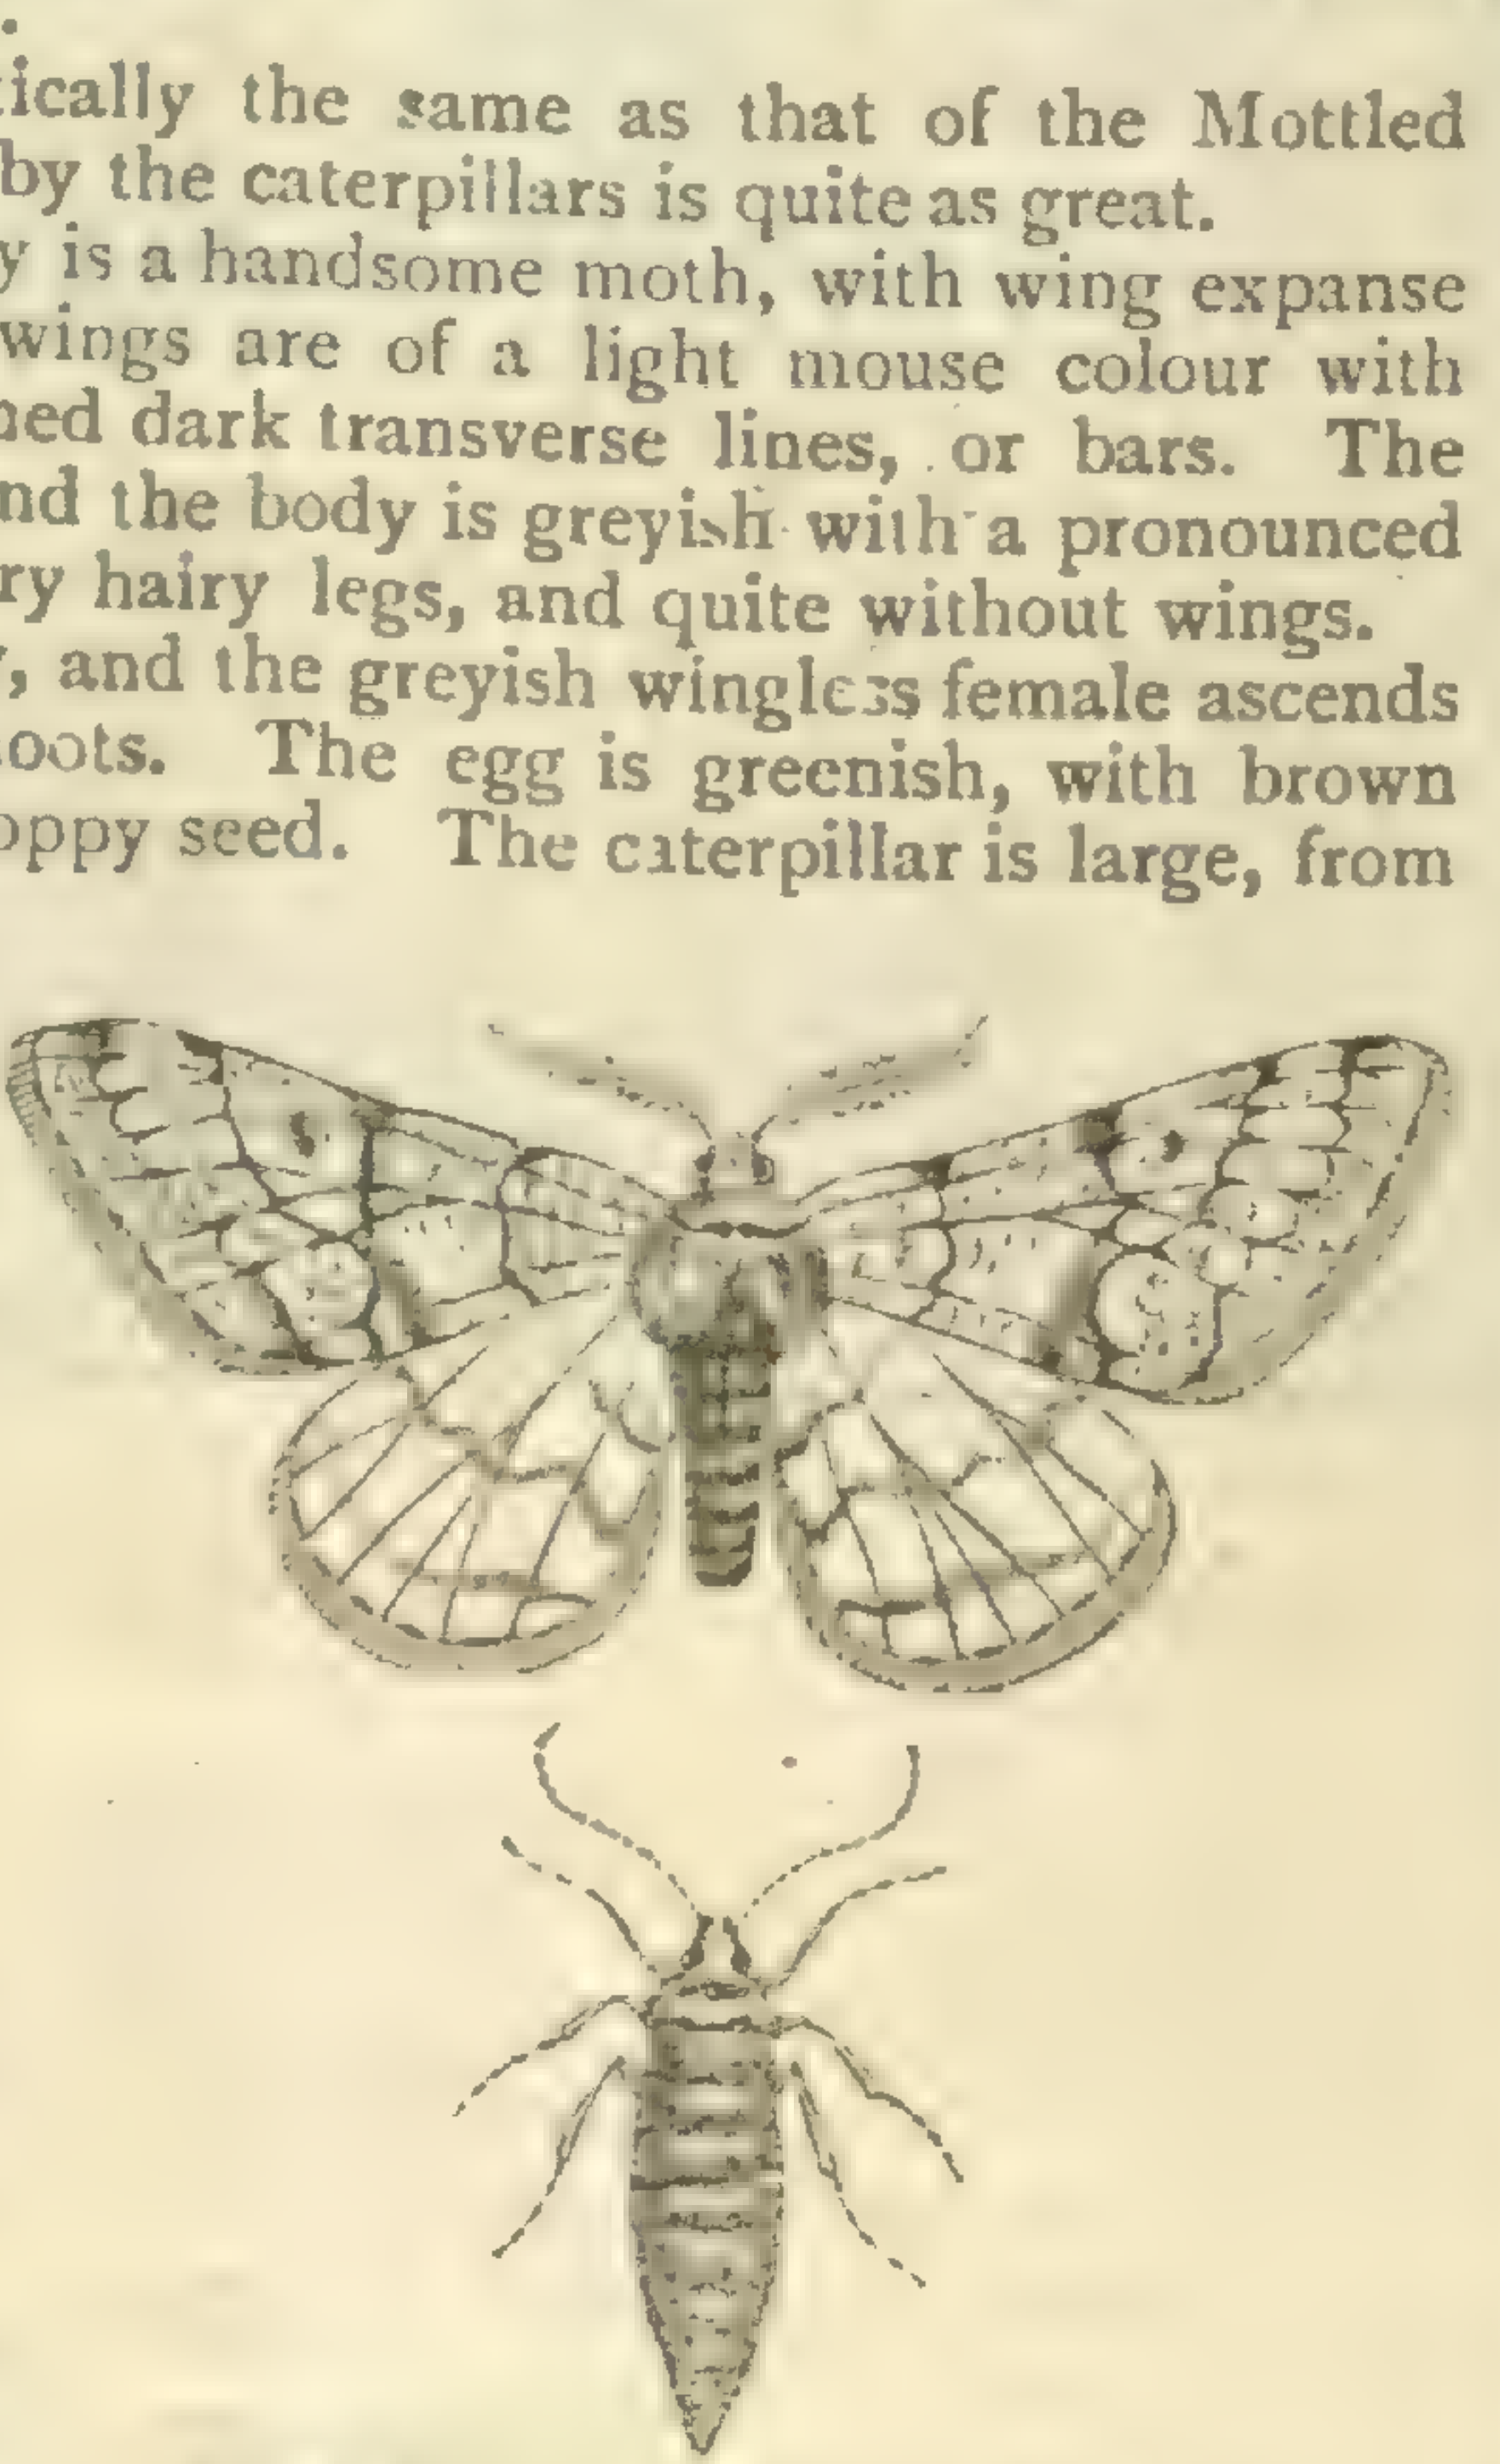
The commonest of these is the Great Winter Moth, or Mottled Umber (*Hybernia defoliaria*), also called the Leaf Stripper. The male moth is large, having a wide expanse of over one and a half to one and three-quarter inches. Its fore-wings are yellowish, or light orange, dusted with dark brown, and have two thick dark wavy patches on each. The hind-wings are a duller yellow, with a very small central spot, and are dusted with light brown. The female has no signs of wings, and is ochreous, thickly covered with black spots. The winged male moths may be first seen in the twilight towards the end of October, flying round apple and other trees, and if careful search is made the wingless females can be found upon the ground under the trees, and upon their trunks. The date of the first appearance of these moths depends upon the weather, and in some seasons they may be noticed as late as December. The females, which can run quickly, go up the trees after pairing, and deposit long yellowish-white eggs, which become darker later, singly upon the shoots and twigs near the buds. A female will lay as many as three hundred eggs. In the spring, as the buds begin to swell, the caterpillars are hatched, and immediately creep into them, feeding upon the leaves and blossoms as they form. The ten-footed caterpillars are slender, about an inch and a quarter long, and of a yellowish ground colour with chestnut-brown markings. There is a succession of caterpillars up to the end of June. When fully fed the caterpillars go into the earth and change to red-brown pupæ, from which the moths come in October.

The Scarce Umber is by no means a scarce moth, judging from its numerous caterpillars found in some seasons on apple and other fruit trees. The wings of the male are from one to one and three-quarter inches across. It has yellowish-brown fore-wings with a golden tinge, and dark transverse lines. The hind wings are yellowish-grey, and the body gold coloured. The female is greyish-brown, nearly half an inch long, with rudimentary winglets of a light grey colour, flecked with brown. It is more hairy than the female of the Mottled Umber. These moths appear towards the end of October, and may be seen as late as January if the winter is open. Greenish eggs, becoming darker in time, are laid upon the fruit spurs by the females, which run up the trees The caterpillars are hatched when the buds swell, and commence feeding at once upon them. They are just over an inch long, slender in form, and of a purple-brown colour, while the sides and under part of the body are yellowish.

The life history of this moth is practically the same as that of the Mottled Umber moth, and the injury occasioned by the caterpillars is quite as great.

The male of the Pale Brindled Beauty is a handsome moth, with wing expanse about one and a half inches. The fore-wings are of a light mouse colour with greenish shadings, and somewhat undefined dark transverse lines, or bars. The under wings are of a rather paler hue, and the body is greyish with a pronounced anal brush. The female is grey with very hairy legs, and quite without wings.

The perfect insect appears in January, and the greyish wingless female ascends the trees and lays eggs singly on the shoots. The egg is greenish, with brown spots, elliptical, and about the size of a poppy seed. The caterpillar is large, from 1½ to 1¾ inches long, cylindrical, very stout, and of a rich-brown colour, with knobs and warts on several of the segments (those on the sixth and seventh segments are particularly large), and black bristly hairs. It pupates in the ground. There is a great resemblance between the caterpillar of this moth and that of the Small Brindled Beauty. The distinction between them consists in the warts of the latter being larger and the colouring mottled with [illegible].



Pale Brindled Beauty Moth.
Male and Female.

The March Moth is frequently abundant, and does much harm to fruit trees and bushes of many kinds, and to filbert and cob-nut bushes. The female is wingless, brown in colour, with a conspicuous brush or tuft of hairs at the lower extremity of the body. The legs are very long. The male moth is about the size of the Winter Moth, with brown forewings streaked with a pale transverse zig zag line on the outer edges and a light fascia. The hind wings are somewhat lighter. The moths are first seen in March, and the female crawls up the trees and lays shining olive-brown, barrel-shaped eggs in series of rings round the small twigs, as shown in Fig. 2. When the buds swell the caterpillars are ready to attack them. They are pale-green in colour, with yellowish-green lines down the back, and greenish spots here and there about 1⅛ inches long, and not unlike the Winter Moth caterpillars, but they are longer, of a more decided green, and not so thick as these. Like the caterpillars of the other moths described above, they pupate in the ground, but the pupæ are enclosed in long oval earthen cocoons lined with silk. The pupa is brilliant-brown with a green shade.

Prevention and Remedies.

The same methods of prevention as recommended for adoption against the Winter Moth must be adopted with regard to the four moths that have been described and figured above.

The most important of these is banding the trees with sticky substances to entrap the crawling wingless female moths and to prevent them from going up the trees to lay eggs upon them; or by putting an apparatus made of wood and tin or other materials to keep them back. Cart-grease put thickly on bands of grease-proof paper, like that used by grocers, is the best substance for this purpose. It should have no tar in it, as this injures the trees. In the case of old trees with thick bark, the roughest part of the bark must be scraped off to allow the bands of paper to be fitted close to the trees. Bands, made of old oilcake—or manure—bags, smeared with sticky compositions, may be employed, but they must be fastened close round the stems or the moths will crawl under them. Hay bands can also be used, but there is nothing so effectual as the smeared grease-proof paper.

The band-straps or guards must be in working order by the middle of October, and they must be watched constantly, and grease applied where it has become dry or been rubbed off. It seems that this banding should be continued throughout the winter, and far on into the spring, as it has been shown that there is a succession of eggs laid by the various moths enumerated above from October up to the end of March. The moths, which lay eggs in spring, are not so numerous as the winter moth, but a few of them are sufficient to produce swarms of caterpillars, which might cause serious injuries to fruit crops. To keep bands in order from October to April is an expensive process, but some fruit growers do it and find that it answers. The guard employed by growers in the United States and Canada might be usefully adopted in this country, and though the initial cost would be greater than that of banding, the subsequent expense would be inconsiderable. This guard consists of a girdle of tin fastened so as to hang three or four inches out from the trunk of the tree, held there by a circle of fine sacking, or linen, and fixed by a cord, to which the sacking is sewn. The tin is smeared all round inside with an offensive substance applied by the means of a small brush, which causes the insects to drop to the ground as soon as they come in contact with it.

Spraying the trees when the caterpillars are at work is most necessary. A few growers begin to spray directly the caterpillars are noticed. A still smaller number spray before caterpillars are seen, with Paris green solution, consisting of 1 lb. of Paris green to 220 gallons of water. This poisons the foliage and kills the tiny delicate caterpillars, which at first are mere threads, hardly distinguishable without a glass.

Spraying with Paris green may also be done later on, and until the apples are formed or have become any size, but it would be unsafe to run the risk of the poison adhering to the fruit. In America Paris green is regularly and most advantageously used, even when the apples are of some size.

Quassia and soft soap solutions may be used at any time, not being poisonous. These do not poison the caterpillars, they merely make their food bitter and distasteful. They are put on usually in the proportion of 7 lbs. of quassia chips and 6 lbs. of soft soap to 100 gallons of water. Some growers use a much stronger quassia wash than this.

Spraying is the only really useful remedy for these caterpillars, and it must be repeated from time to time.

SWISS NATIONAL CHRYSANTHEMUM SOCIETY.

Since writing my last notes, in which a brief allusion was made to the founding of the above society, I have received the rules and also a copy of the schedule of the first exhibition of the above society, which will take place next November at Geneva, and of which it is announced 50 per cent. of the profits are to be devoted to some charitable objects. Foreign exhibits are requested, but only in the class for new seedlings not already in commerce. The aim and objects of the society are briefly set forth thus: To encourage and develop the culture of the flower by organising shows, awarding medals or subsidies, awarding certificates of merit to deserving novelties, arranging conferences, offering advice to other societies desirous of holding shows and preparing schedules, supplying information to members on all points concerning the chrysanthemum at home and abroad, and finally assisting amateurs to make suitable selections of the best novelties to grow.

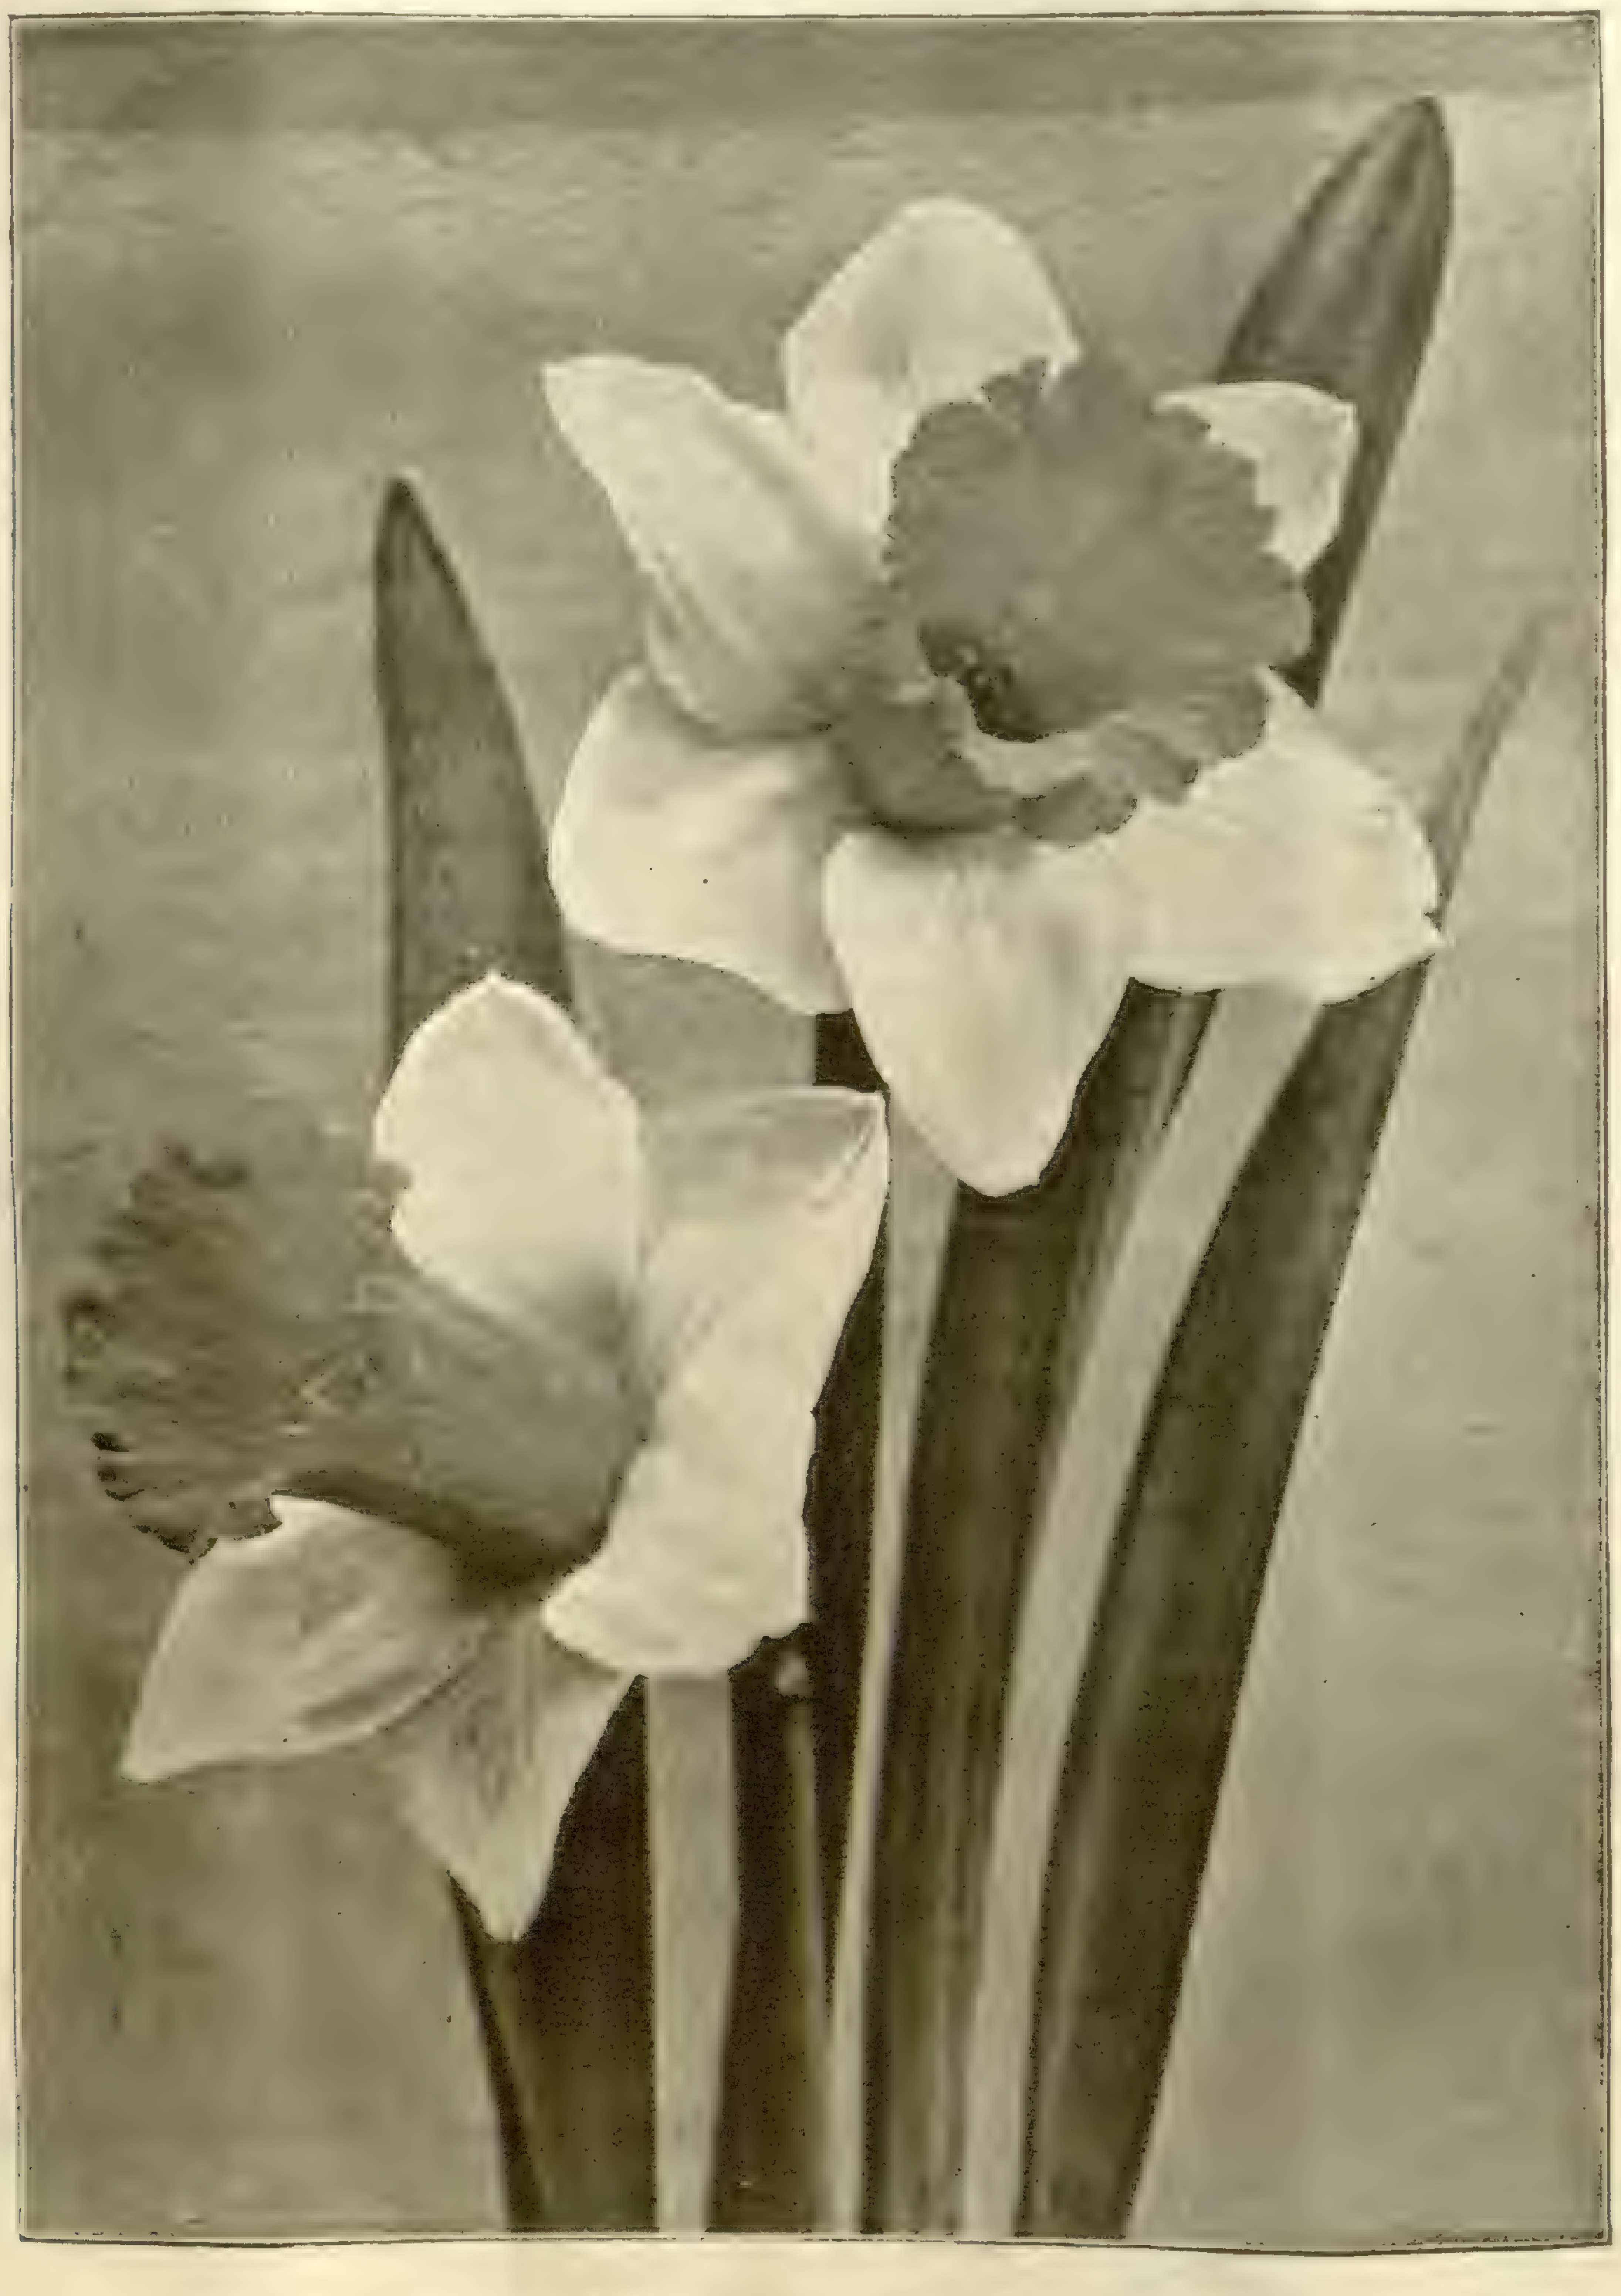
There are three grades of members, viz., active, honorary and corresponding.

Early in the year the society will issue a journal containing the official report, balance-sheet, a catalogue of the best varieties shown during the autumn, and a series of articles dealing with the flower and its culture. C. H. P.

Cactus Dahlias.—When Mr. Burrell first exhibited that curious and interesting cactus dahlia Fantasy, with its crab's-leg-like petals and quaint form, there was a not unnatural impression that a new and distinct race was foreshadowed. So far there has been no special product seen of the nature indicated, but there is yet ample time, as only two years have elapsed since Fantasy was first exhibited. I believe Mr. Burrell has some very novel seedling flowers in hand to show at the Crystal Palace on the second inst., but of these more may be written after they have been seen. But Mr. Burrell holds that the cactus dahlia as a flower form or section is yet in its infancy, and that there is no telling what beautiful things may in time be produced. As evidence of that, Messrs. Keynes, Williams, and Co., of Salisbury, a firm closely associated with the dahlia for many years in all its divers forms, had, in a stand of special blooms at the Shrewsbury show, a flower of so interesting a character that the firm had named it Progenitor, a very suitable name, as, without doubt, in their hands it will ultimately produce some novel successors. This flower, of a rich reddish colour, had the usual cactus form and petals, but the tips of these latter, instead of being pointed, were so far deeply divided that they bore the appearance of miniature stag's-horns. It may be a question with florists as to whether the variety can be admitted into the ranks of true cactus forms, and I venture to suggest that in a competition it may be unwise to present it. But if it should become the progenitor of a distinct race of stag's-horn petalled flowers that still possess the cactus form, then we may hope to see the present popularity of the dahlia largely extended. A. D.

A BEAUTIFUL NEW DAFFODIL.

As the season of bulb planting is at hand, we venture once again to remind our readers to order early and to plant early. There is scarcely need nowadays to remind horticulturists of the beauty and usefulness of the widely different species and varieties of narcissi, for their value is well known even to those who do not grow them. In our present issue we give an illustration of a splendid new bicolor, large trumpetted daffodil, introduced last year by its raisers, Messrs. Barr and Sons, Covent Garden and Long Ditton. It is a real beauty, as the illustration, from a photograph taken in the spring of the present year at Long Ditton, will show; it is also a strong grower, and, for a new variety, is by no means high priced. To those who have not yet tested it, we can state that it is also a good forcing variety. Since its first appearance in public we have repeatedly drawn attention to the variety, and have nothing now to add to or detract from the opinion already expressed upon it in these columns. On p. 199, 1897, we referred to it as "the new bicolor form named Victoria, a splendid flower with whitish perianth and golden trumpet"; and on the succeeding page it is described as "a handsome bicolor variety of large size; the whitish perianth shows up the bright golden trumpet, and the latter is frilled at the apex." The variety gained a first class certificate from the Royal Botanic Society and an award of merit from the Royal Horticultural Society on March 31 and April 27, 1897, respectively. On p. 279 of the present year, in "Daffodils at Ditton," this new comer was referred to as follows: "Victoria, the Messrs. Barr's 1897 introduction, is a lovely bicolor, with creamy-white perianth and golden trumpet, the latter finely frilled at the mouth; Victoria has a splendid constitution, and grows freely.

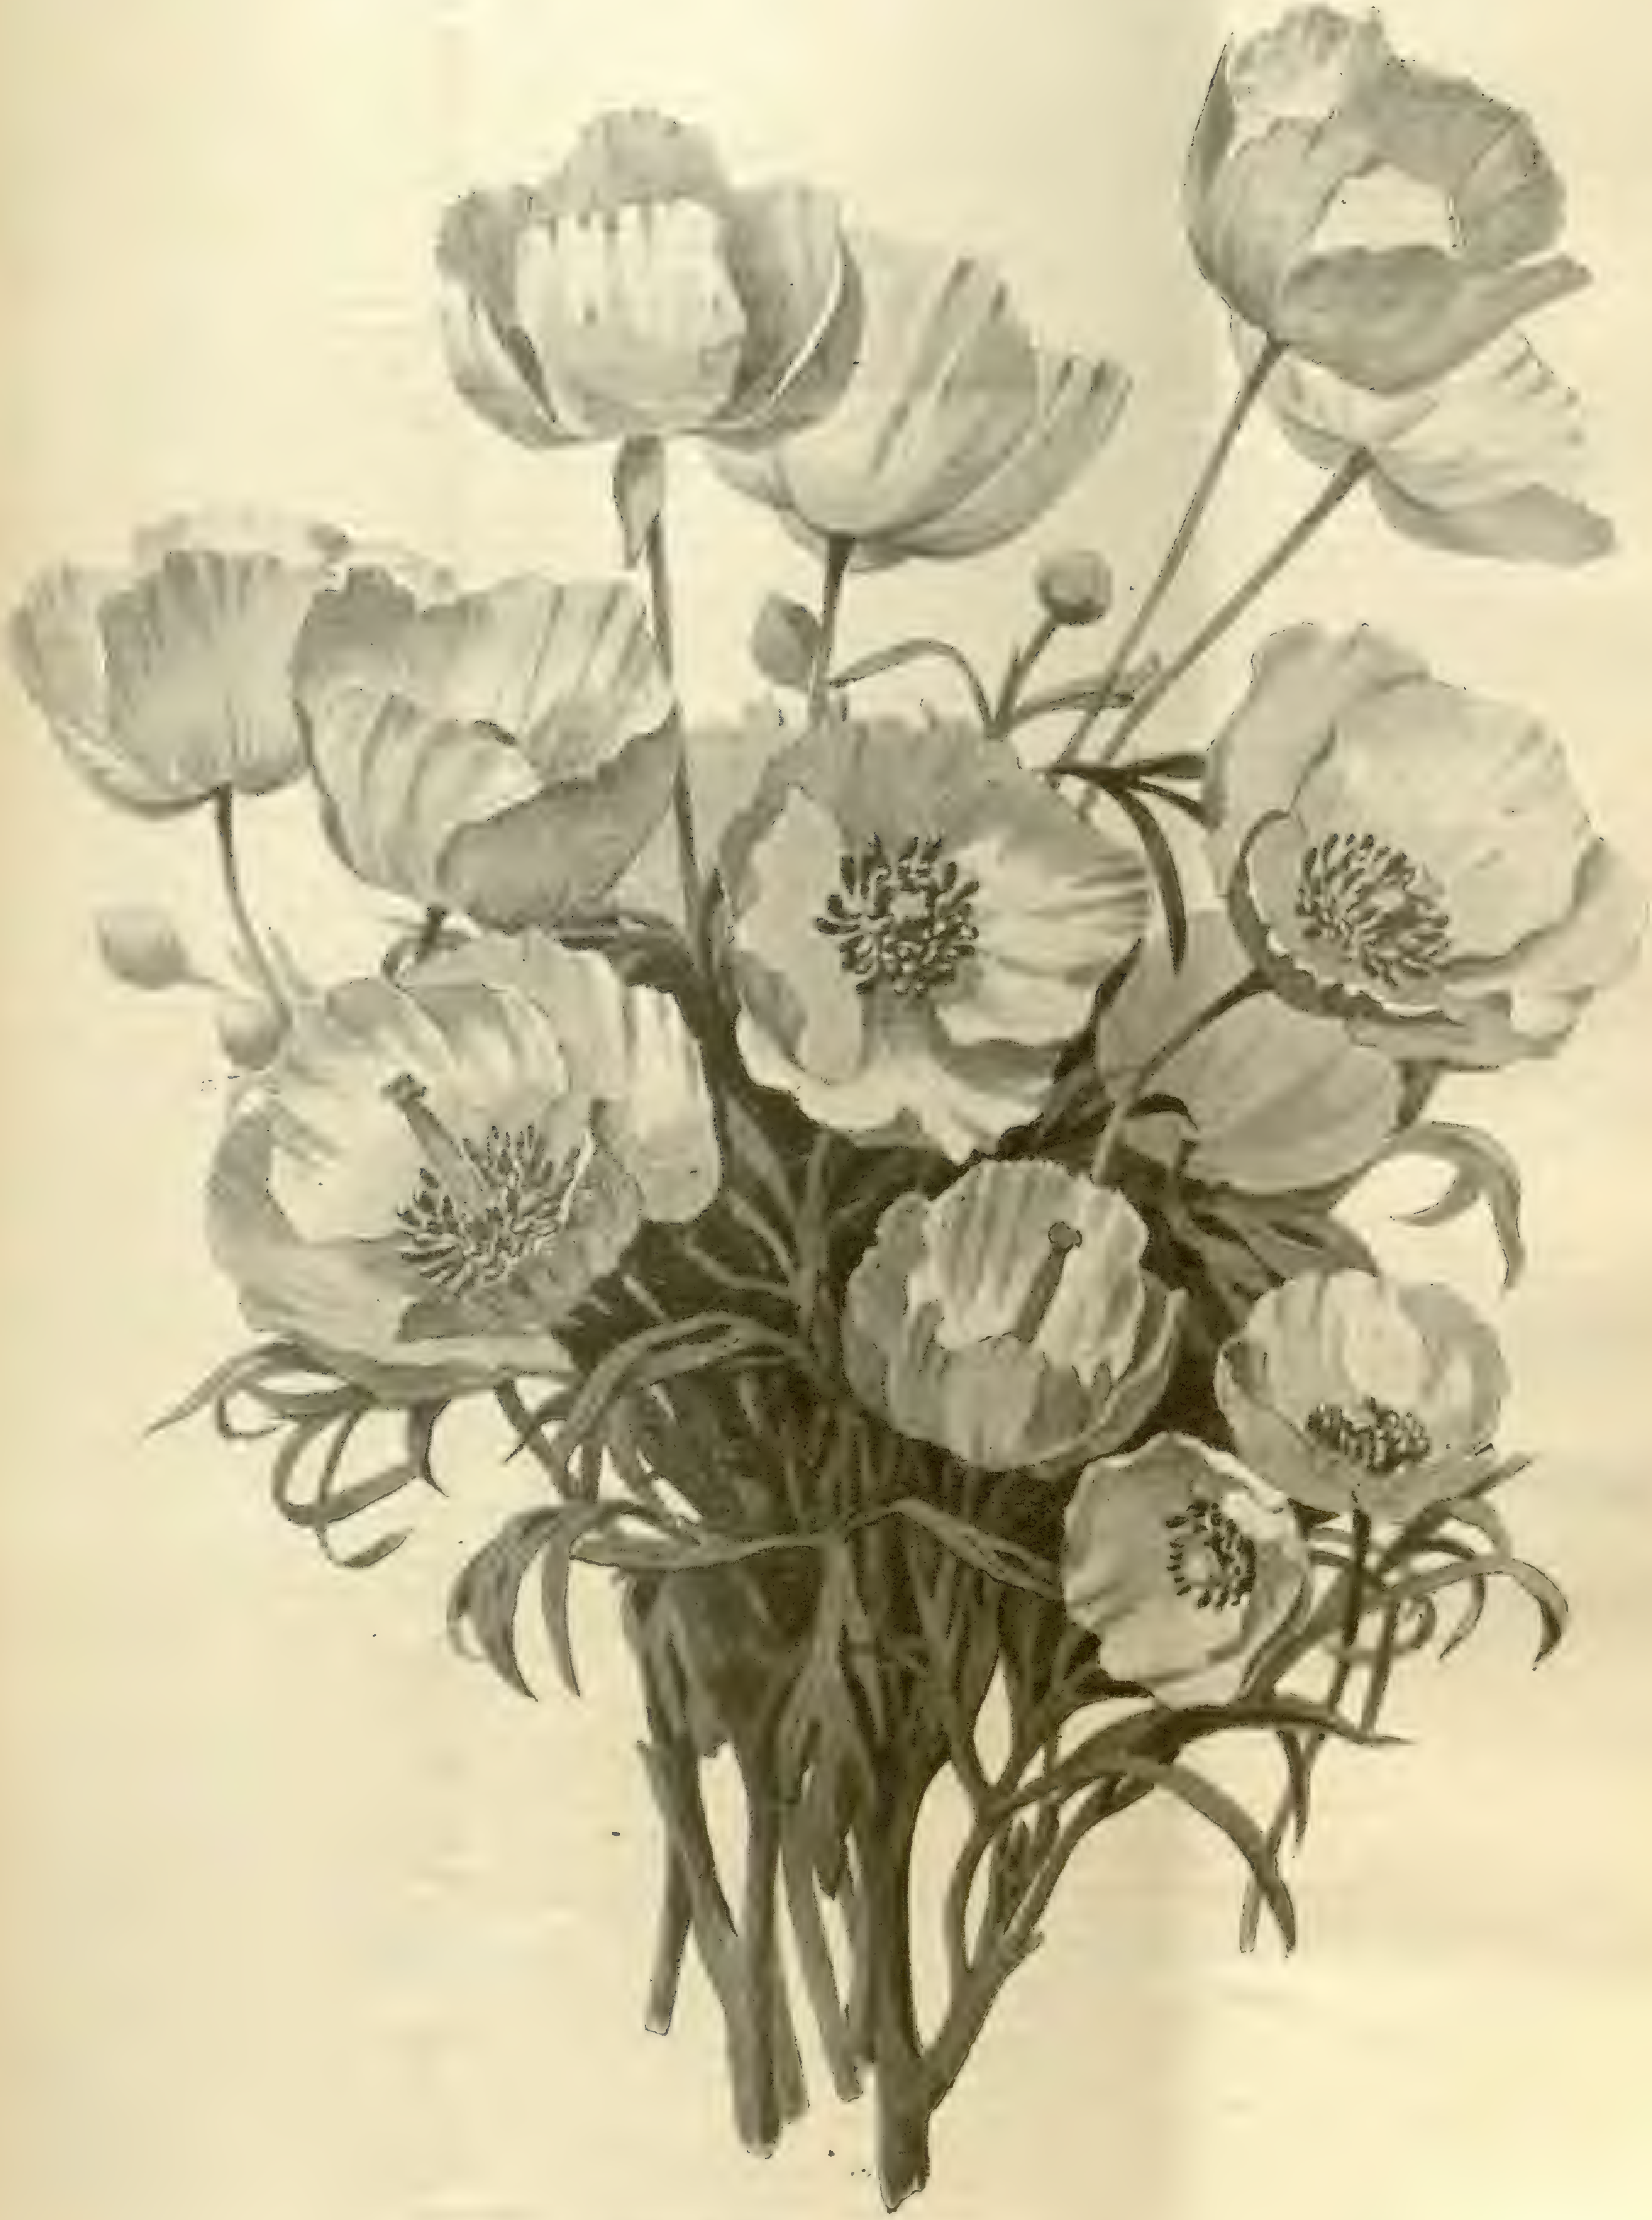


NARCISSUS VICTORIA.

HUNNEMANNIA FUMARIÆFOLIA.

It is a great misfortune that this beautiful old Mexican plant is not perfectly hardy, even in the warmer parts of this country, for not only does it produce graceful, shapely and bright-hued blooms that do not soon fade, but it possesses also an elegance and beauty of foliage decidedly its own, notwithstanding that it is sufficiently like that of some fumitories to have warranted Sweet in giving it the specific title of fumariæfolia. The leaves are tri-ternately divided, that is to say, each leaf divides into three when about an inch or so from the stem, and each of these divisions again soon divides into three parts, which are further split into three divisions. The final division is worthy of note, for as a rule the central lobe has three equal leaflets spreading from its apex, while the two side lobes are like a long leaflet, with two leaflets springing from its side, and spreading to right or left according as they are on the right or left of the centre. Thus one leaf is composed, usually, of twenty-seven linear, blunt-ended leaflets, all of a pale, glaucous tint; sometimes there is an additional leaflet, and at others one is suppressed.

The genus Hunnemannia is monotypic, and was founded by Sweet, who named it in honour of Mr. J. Hunneman, a zealous botanist and botanical agent, who did much to facilitate intercourse between British and Continental botanists, and, after a long and busy life, died in London in 1837. The one species, H. fumariæfolia, figured in the present issue, was introduced in 1827. It is a very charming and showy perennial, but only half hardy. In the drier, sheltered parts of Southern England it may be wintered out of doors if carefully protected. but perhaps the best method of cultivating it is to treat it as a biennial. The flowers are terminal and solitary, but as numerous growths are



HUNNEMANNIA FUMARIÆFOLIA.

produced, a fine effect is made, for the large yellow, orange-tinted flowers are most effective, and borne well above the foliage on wiry stems. In shape and colour the flowers are much like those of Eschseholtzia californica, but they also remind one of poppies, indeed, the genus belongs to the order Papaveraceæ, and is closely allied to the Meconopsis. When cut, the blooms of Hunnemannia fumariæfolia are eminently suitable for vases, table decoration, &c., as they are not in any way heavy; they are elegant without being flimsy, bright without being gaudy, and they last a long time, both in water and on the plant. As a general rule the Hunnemania grows from two to three feet high; it has not been grown much of late years, owing doubtless to its failure as a hardy plant, but now that it has been brought before the public at a recent meeting of the Royal Horticultural Society, its cultivation will be again freely attempted by those who have room in frames and pits to protect it from our damp, cold winters. Our illustration was made from flowers supplied by Messrs. J. Veitch and Sons, Chelsea, and which induced the R.H.S. to grant the plant an award of merit.

THE RETURN OF THE HOLLYHOCK.

THE hollyhock has been coming back for some time, partly, some say, by favour of the hollyhock fungus (Puccinia malvacearum), which has ravaged and scourged the hollyhock for the last quarter of a century. Like other more or less inscrutable diseases of similar sort, this has its resting and active spells. Now ravaging and destroying its victims in the most wholesale way, and anon touching them gently or not at all, as if nursing them for future destruction. Some assert that we have lately been passing through a resting period of unusual duration in the history of this virulent pest. What is certain is that hollyhocks are in better health, and that their culture is advancing by leaps and bounds to the ennobling and enriching of our gardens. No one who has had time to look in at the Botanic Gardens, Regent's Park, this year, can for a moment doubt the immense advance made in hollyhock culture in the last decade. About that period back it had perhaps reached its lowest ebb. Now we see them constantly cropping up in the most unexpected quarters. But in Regent's Park we see them in their hundreds and thousands, mostly singles, it is true, and perhaps all the safer in the future, and the more striking and stately beautiful in the present on that account.

I have a theory that cultivators, through running too exclusively on doubling lines, brought much, perhaps the major portion, of the fungoid pest on themselves. Anyhow, doubling does little or nothing to help hollyhocks, or any other plants, out of fungoid or other pests or diseases. How much it may have done to predispose them to such maladies we shall probably never know. What we do see, and fully know to-day, is this: that the majority of single hollyhocks that come under our notice are pictures of robust health and models of picturesque beauty. By massing these single hollyhocks in scores, fifties, hundreds, we enormously raise their place and power in the park or landscape. So much is this the case that I have no hesitation in stating that among all the masses of charming flowers and foliage marshalled in the park this August, nothing excels nor matches in stately dignity or glowing colour the bold masses of single hollyhocks. They also seem pictures of health and free from disease.

How far this hieing back to single forms should be credited with this return to better health and new vigour might be a disputed point; for I am quite willing to admit that double flowering hollyhocks, free from disease, are becoming less rare day by day. Still, single hollyhocks seem cleaner, have more vigour, and are taller in stature than double ones. Artists also prefer them for picturesque effect, and here, I admit, I agree with the artist. Neither am I sure that the double hollyhocks give the most colour in a landscape. For much of their colour is hid in themselves and each neighbouring double bloom, whereas single blooms, from their peculiar shape and colour, give light, that is colour, to all within sight or range of the landscape they at once ennoble and adorn. They also give rich and striking colouring at a height from the ground that few other plants could reach. This was especially manifest in the Regent's Park. With the single exception of a magnificent group of standard fuschias many years old, smothered in bloom, the single hollyhocks towered high above the other flowering plants, and furnished a novel sky-line with new grandeur and beauty. Their unique and striking height, giving brightness at an elevation above the ground where monotony and dullness too often prevail, ensures a large place in our gardens and landscapes of the future for single hollyhocks. D. T. FISH.

AN ISLE OF WIGHT GARDEN.

ONE of the most popular and best kept gardens in the Isle of Wight is that belonging to Sir Barrington Simeon, Bart., M.P., Swainston, Newport. The park is very extensive and well wooded with trees of remarkable size, whilst the garden is admirably kept under the charge of Mr. J. Gash. At the time of my visit I found the men busy lifting potatos to save them from the virulent disease, which is very bad in this part of the island. The variety was Windsor Castle, and the crop very good indeed, considering the season. With the exception of apples, the fruit crop is considerably below average here. The borders on each side of a wide grass path, which runs the whole length through the middle of an extensive kitchen garden, are gay with salpiglossis, calliopsis, godetias, mignonette, asters, stocks, marigolds, &c.

There is one of the best crops of onions in these gardens that I have had the pleasure of seeing this season. Mr. Gash, who is a prominent and successful grower and exhibitor of chrysanthemums, has a collection of about three hundred plants which promise well for future success. Since my last visit most of the houses have been rebuilt, and contain at present a miscellaneous assortment of flowering and foliage, stove and greenhouse plants, a good crop of grapes, including some fine bunches of Muscat of Alexandria, also melons and cucumbers. The gardens speak well of the abilities of the genial gardener, Mr. J. Gash.

S. HEATON.

WORK FOR THE WEEK.

WARM ORCHIDS.

DENDROBIUMS of the following kinds will now be fast completing their season's growth: D. Finlayanum, D. Cybele, D. C. nobilius, D. splendidissimum, and its several vars., D. nobile and its vars., and seedlings of the above unless in a small state. When they have fully made up their growth they should be removed from the dendrobium house to quarters about five degrees cooler, prior to removal into their annual resting quarters. Gradually decrease the water supply but gradually increase the supply of air, taking every care that this is done so that it does not come in direct contact with the plants, which would be a great check and would certainly have a great tendency to encourage the propagation of the enemy which baffles many growers—black spot—and which often eats its way throughout the whole plant. Every effort should be exercised to prevent this disease from gaining a foothold, for generally the best varieties are affected, no doubt because they are coddled somewhat. Odontoglossum citrosmum that has been given intermediate treatment has perhaps in many cases not grown satisfactorily owing to the weather we have had; it is as well to examine the plants, and if not growing well remove them to a house a few degrees warmer in order to give them time to make up a good bulb so that they can obtain a good rest.

Sobralia macrantha and its variety alba, Sobralia Kienastiana, S. Veitchi, S. Lucasiana, S. xantholeuca, and S. leucoxantha are all showy orchids; many growers are in the habit of giving them stove treatment, which is, I think, a great mistake. I always find the intermediate house the best, and have grown them in it for a long period. The new roots will be commencing to grow, so that if a larger pot is required it would be a good time to afford it now. A good compost for sobralias is a mixture of rough peat and some good loam with a little leaf mould and silver sand; pot them moderately firm (not hard) and keep them rather dry for a time, otherwise the roots will rot away. Cattleya Hardyana will now be flowering, and is a grand orchid, though found rather difficult to manage by many growers. The worst time for it appears to be after the flowering season; in many cases it is given too much shade, others allow too much water. It is best to keep it rather dry while in flower and for a considerable time afterwards, in fact until next spring, and if a spot, however small, is noticed less water still should be given, at the same time allowing plenty of light and plenty of fresh air. If the leaves are slightly yellowish, such is not a bad sign unless an unreasonable yellow tint is seen, for the greeny yellow hue is natural to the plant. This orchid thrives well in baskets suspended from the roof at the warm end of the cattleya house. Lælia (Brassavola) Digbyana will have finished flowering and must be allowed plenty of light and given a thorough rest; place as close as convenient to the glass and keep dry, but not so as to shrivel the pseudo bulbs.

The present condition of the weather will allow good atmospheric conditions inside the house; the roller blinds will not be required except when the sun is very strong, as plenty of light on all occasions must be afforded; give air freely but carefully, and afford less water at the roots all round. Quiet nights must be chosen for fumigating, and the heating apparatus must be kept well in hand.—T. STAFFORD, *Tyntesfield Gardens*.

STOVE PLANTS.

As the days are now shortening and the sun losing power, less shade will be necessary, so that the plants may receive the benefit of sun and light to thoroughly mature their growths before the winter comes upon us. Where permanent shading is used, such as summer cloud, lime and milk, &c., it will be necessary to wash off part of it, the remainder to be removed in the course of a week; choose a dull day for the operation, it being easier to remove on such a day, and the plants likely to suffer less. In the case of blinds it will only be necessary to lower them during the middle part of very hot days. In structures where creepers are extensively grown on the roof, these should be freely thinned, not at the same time that the shading is reduced, but during the course of a few days. Allamandas will continue to flower for some time yet, and must receive aid in the way of stimulants. Gradually bring stephanotis to a state of rest by reducing the water supply, and when possible, removing the plants to a cooler house. Stand plants of vinca where they receive the maximum amount of light to mature their growths. As the specimen caladiums pass their best encourage them to go to rest, reduce the supply of water to the roots, and eventually lay the pots on their sides in the bed of the stove. Clerodendrons that are still growing should be fed, affording the shoots all the light possible, as next season's success with these and similar subjects depends upon the thorough maturation of the present season's shoots, and in keeping the foliage healthy and clean until it naturally ripens and falls away. Euphorbia jacquinæflora may now be introduced into the stove, keeping the plants to the front of the house where the shoots may be looped to the wires, as in such a position they will do far better than if dotted promiscuously amongst the plants in the body of the house.

It will be necessary to remove poinsettias from the cold frames, placing them in a house where they can be afforded artificial heat and plenty of light. Dispose the plants thinly. Be careful, when moving them, that they are not bent or injured in any way. When they have become used to their new quarters, afford each plant a topdressing of loam, leaf-soil, and sand, amongst which is mixed a little of some good fertilizer; before applying the topdressing, see that each ball of soil is thoroughly moist. Afford them a good syringing twice a day, and a temperature of 60 to 65 degrees by day and 55 to 60 degrees at night. If space will admit, the bulk of winter-flowering begonias may be stood in the same house, and any of the latter which have not yet been placed in their flowering-pots should be potted without delay. Eranthemums and sericographis also should be removed from cold frames to a warmer structure, but on no account remove any plants directly from cold frames to the stove. Shrubby clerodendrons, such as C. fallax and C. fragrans, that are flowering now, will repay for liberal treatment, and will need constant attention to keep them free from mealy-bug and scale. Anthuriums are still growing freely, and should receive applications of weak liquid manure two or three times a week. If there is any scale in the house where these are growing, it will be necessary to sponge them over occasionally to prevent them becoming infested. Plants of plumeria that have completed their growth should be afforded a very light position, but rather less water than hitherto. Continue, however, to afford liquid manure at every other watering for a week or two yet. In lean-to houses attend regularly to turning the plants, for, unless this is done frequently, the leaves all incline towards the light on one side, making the plants useless from a decorative point of view. In the palm house, one good syringing a day will now be sufficient. Admit air freely on all favourable occasions to have the fronds well hardened to pass well through the winter. —J. TUNNINGTON, *Ripley Castle Gardens, Yorks*.

THE FLOWER GARDEN.

THE propagation of the various bedding subjects required for next season should be pushed forward as far as the supply of cuttings can be obtained. Pelar-

[illegible]niums not having made a strong growth this summer, the cuttings of some varieties are somewhat scarce, and with these a few should be inserted as often as obtainable without spoiling the effect of the beds. Cuttings of fuchsias, iresines, lobelias, coleus, alternantheras, &c., should now be inserted in pots of sandy soil and sifted leaf-mould. The best place to strike these is in a frame on a moderately warm hotbed. If any difficulty is experienced in obtaining cuttings of alternanthera, owing to flowering shoots being abundant, a portion should be cut over, and these may be potted up later on. With most of the above subjects sufficient only need be propagated now to afford a stock for spring increase. An unnecessary surplus which must be afforded house room through the winter should be avoided, therefore the requirements of each should be estimated, and the work proceed accordingly. Any changes desirable in the bedding arrangements should also be decided upon, and effective combinations noted for repetition, perhaps in other suitable situations. A simple and effective mixture is the old Manglesi variegated pelargonium and the similarly old Verbena venosa, the pelargonium being allowed to retain its profusion of small pink flowers; Lady Plymouth pelargonium and viola Archie Grant is another pleasing mixture. Some large oblong beds planted with a few five to six feet standard heliotropes in the centre, with dark-leaved cannas, fuchsias, variegated abutilons, and Lobelia cardinalis of rather lesser height scattered thinly over the bed, the latter edged with a band of Coleus Verschaffelti, and the remainder of the ground work covered with Dactylis glomerata variegata, forms a telling combination. This hardy silvery-leaved cocksfoot grass is a most useful plant, and especially as it requires no housing in winter. With the continued drought those plants may also be noted that are best in resisting the dry weather and giving a good display of bloom. Pelargoniums have been very good, and others are zinnias, gaillardias, verbenas, antirrhinums, ageratums, and petunias. The old-fashioned Nierembergia gracilis, with lilac and white flowers, now not often seen, is one of the most effective trailers for hanging a foot or more over the sides of vases or boxes, and I never saw it blooming more profusely than it is this season. Pentstemons have also flowered well through the dry weather. Where propagation by means of cuttings is practised, the young growths now just starting from the base may be shortly used for this purpose. The cuttings should be inserted in small pots or boxes, if a quantity is desired, and stood in a close frame. It is not, however, necessary to propagate in this way, excepting in the case of very choice seedlings or named varieties, as a fine selection of colours may now be certainly raised from seeds of a good strain, and if sown now or quite early in the spring strong plants, flowering the first year, are easily raised. A great improvement in the bright crimson and scarlet colours of these has been attained during the past few years.

With the advent of a good rain, much work already mentioned in previous notes, and which the dry weather has kept at a standstill, should be put in hand without delay. Violas, where required for spring bedding, should receive early attention; myosotis and other subjects may be pulled in pieces and treated similarly. The larger-flowered doronicums as D. excelsum are very useful spring-blooming plants, and may be utilised for filling beds where plants three to four feet high are desirable. If the clumps are lifted now and pulled in pieces, and each young growth planted separately five or six inches apart they will make strong plants for lifting and replanting into flower beds in October. As a substitute for box edgings in the flower garden aubrietias of the close growing forms, as græca, deltoidea, and Campbelli, are very useful. Such an edging has advantages over the commonly used box, for during a portion of the year it is a mass of bloom, and it is also of less trouble to establish and keep in order afterwards. The present time is a suitable one for planting new and for cutting into shape established edgings of this class. The trimmings from the latter make excellent material for the establishment of new borders. The ground should be prepared somewhat similarly as for box laying, treading the soil flat and firm, and planting with a line. The soil edge should be chopped down squarely about two inches nearer the path than the line of plants are planted, and this the aubrietias will soon cover, and form a compact and pleasing edging that may be easily kept [illegible] condition for many years with very little trouble.

Seed vessels on bedding plants of all kinds should be promptly removed, as well at yellow or decaying foliage. Herbaceous borders have suffered from the continued drought, but nevertheless helianthus and some others keep up a bright [illegible]. One of the earliest flowering Michaelmas daisies—Aster amellus [illegible]—is now in flower. It is perhaps the best variety to withstand dry [illegible], and is quite fresh and green in leafage, even where no water has been [illegible]. Some of the taller growers will need tying now they are just coming [illegible] bloom, or previous ties made secure against autumn gales.—C. HERRIN, [illegible] *Gardens.*

HARDY FRUITS.

[illegible] will now be ripening freely, and many of the earlier kinds are already [illegible]. Rivers' Early Prolific this season was our best early cropping variety, [illegible] walls the newer Stint, one of the Messrs. Rivers' seedlings, never fails to [illegible], even in the most adverse seasons, and this year, when plums are much [illegible] an average crop, any new kind that is prolific is worth special notice. [illegible] lack of fruit the plum trees are making a gross growth, and as such [illegible] is not fruitful the cultivator will do well to check it as much as possible. [illegible] trees and with leading shoots there is a difficulty, and in many cases [illegible] be met by lifting the trees in the autumn, as to cut hard either the [illegible] tops will frequently result in gumming and canker. I would call attention to the necessity of laying in side wood wherever possible, as I find if there is [illegible] percentage of young wood there is a much better return. Many rely [illegible] on spurs for fruit, but if some fruiting wood also, in the shape of young [illegible], can be secured there will be better results. We have some cordon plums [illegible] were closely spurred annually and yet never bore a crop, but when we [illegible] free extension of side shoots we obtained a fair crop. In the case of old [illegible] it is much better to have the spurs close to the wall and not in a [illegible], at the same time laying in new wood in vacant spaces, as some [illegible] do not fruit freely on the old wood. I recently advised the importance of [illegible] healthy growths from old fig trees in preference to wood that rarely produced a crop; since then we have had grand weather to ripen up the new wood [illegible] is for extension, and now we must induce the growths to harden as much as possible by clearing away small useless spray growth and stopping shoots rather [illegible] that are needed for next season fruiting. The figs bear on this young wood [illegible] points, and if stopped at the fifth or sixth leaf from the base will then form the embryo fruits for next season. Of course new main leaders will not need [illegible] unless they have reached their allotted space. Old trees cropping freely [illegible] by a mulch of strawy material over the roots, and the trees will take [illegible] supplies of water and liquid manure. I would point out the advantages of figs in pots, as they are certain croppers, and though they give more labour in the [illegible] the crop well repays for the same. Now is a good time to secure [illegible] and any variety does well, but especially those that cannot be planted out in many parts of the country, such as Nebian, Negro Largo, and Bourjasotte Grise, dark-fleshed kinds of delicious flavour; these trees, housed in winter and plunged in open borders in the summer, give a good return; they do not make gross growth, but fruit late in the autumn, and make sturdy, fruitful growth yearly.

Peach and nectarine trees will need examination every day to secure the fruits, and these gathered just before they are quite ripe will remain good a long time if stored in a cool room; later kinds should have any leaves or shoots removed that cover the fruits so as to obtain the high colour so desirable. Any trees recently cleared of fruits, may, with advantage, have any shoots overlooked in previous thinnings removed and those shoots that may have become loose given support so that there is no twisting or breaking in rough weather. In training the leader do not crowd in any way, and if possible place it so that it does not cross others and is as straight as possible. Morello cherries on north walls that have had the crop cleared may receive attention. I am in favour of giving these trees more space than is often allowed, but I fail to see the necessity of laying in every young shoot, so many of the weaker ones and spray growths may be cut hard back, for the best of these will make spurs and leave the stronger shoots more space to develop. The trees carrying fruit for late keeping will now need close netting and even then close watching, as squirrels are very fond of these fruit for their stones, and they soon clear a tree. In our case it has been necessary to water Morellas owing to drought, and mulch also to prevent the fruits shrivelling. I fear many fruit trees will suffer next season unless moisture be given liberally now to assist in swelling up the buds for next season's crops. We have had but little rain during the summer, and in light soils trees soon suffer. Watering after a slight rainfall should not be relaxed, indeed may be increased with advantage. Many growers who lift trees in the autumn often find the roots dust dry at a depth of two feet, and in many cases copious supplies of water or liquid manure with a mulch would prevent failures another season. Owing to the heat and drought American blight on certain kinds of apple trees is spreading badly, and this is one of the worst pests the grower has to contend with. We are syringing our trees with soluble pretroleum mixed with soft water, as this does not injure the fruit if not used too strongly; we use one pint of petroleum to ten gallons of water, and in the winter much stronger doses are applied when the branches are bare. Red spider is bad this season owing to lack of moisture, but here strong measures are not needed as this pest can soon be got rid of.—G WYTHES, *Syon Gardens.*

NOTES ON ORCHIDS

LÆLIA MAJALIS.

THIS Mexican species is amongst the most lovely or the genus, and when in bloom is an ornament to any collection of orchids. The flowers are large and of a most delicate rose colour in the sepals and petals, the lip purplish lilac and white. Unfortunately it is a difficult plant to flower, although the growth is free; by some growers it is annually placed out of doors during the summer months. Here at Edinburgh it is grown in the cattleya house, hung under the ventilators, where it receives a full amount of air and light. Very little compost is necessary about the roots, and water must be almost entirely withheld during winter.

R. L. H.

ACINETA COLOSSA.

When in flower this is an attractive plant, bearing strong inflorescences of creamy-white flowers, the labellum being marked with purplish spots. As with the rest of this genus the flowers last but a short time—a few days at most—the spikes pushing through the bottom or sides of the basket with considerable vigour. This species is among the strongest in growth, producing stout foliage eighteen inches or more in length. Being a strong grower and free in rooting, a fibrous loam and peat compost suits it, while a wholesale supply of water is required while growing, yet at no time entirely withholding the supply. R. L. H.

Royal Botanic Gardens, Edinburgh.

PLEUROTHALLIS RUFA.

A small growing Mexican species with linear-oblong leaves and short racemes. The flowers are wholly of a dull brown-red colour, save the lip, which is brown. This little orchid flowered with Messrs. Seeger and Trop, at East Dulwich, in June, 1890. *Kew Bull.*, p. 192, 1897.

PLATYCLINIS RUFA.

This is a very distinct species of a genus, popularly known as the chain orchids. The small, ovoid pseudo-bulbs are surmounted by a single, narrow leaf, while the long, drooping, and slender scape carries a short raceme of tiny reddish-brown flowers. This first flowered at Glasnevin in February, 1894. *K. B.*, p. 192, 1897.

DENDROBIUM CYMBIFORME.

A curious and remarkable Sumatran dendrobium with pseudo-bulbs from six inches to a foot long, clothed with oblong-lanceolate leafage. The flowers are of medium size, and borne in axilary, bi-flowered racemes. The colour is straw-yellow, the petals being almost white; both petals and sepals have each five purple stripes, and there are five purple lines at the apex of the ungniculate lip. This species flowered in the collection of Mr. Kienart, Zurich, in April, 1896. *K. B.*, p. 193, 1897.

DENDROBIUM HIRTULUM.

This has elongated, terete growths, and linear oblong leafage. The short racemes are laterally produced and carry three to five bright yellow flowers that are streaked with red-brown on the sides of the lip. It is probably a Burmese orchid, as it is reported to have been imported with Dendrobium infundibulum. It flowered with Mr. H. Grose-Smith, at the Priory, Isle of Wight, in March, 1898. *K. B.*, p. 193, 1898.

BULBOPHYLLUM SPECTABILE.

A creeping species, with dark, small, and ovoid pseudo-bulbs, each carrying a single, leathery and elliptic leaf. The scape is very short, and bears but one flower of a pale green hue, with numerous lines of deep brown spots. B. spectabile flowered at Glasnevin in May, 1896. *K. B.*, p. 193, 1898.

ERIA LATIBRACTEATA.

This curious little eria has pale yellow flowers; it is a Bornean plant, and was described in a recent issue, in connexion with a figure in the *Bot. Mag.*, t. 7,605. A detailed botanical description is given in the *K. B.*, 194, 1898.

CŒLOGYNE PULCHELLA.

The pseudo-bulbs of this species are ovoid-oblong and surmounted by a pair of rather thick, oblong-lanceolate leaves that are very shortly petioled. The terminal slender scape carry several flowers that are pure white with a brown blotch on the disk of the lip and a smaller one at the base of the lip. The species is from tropical Asia, is closely allied to the yellow-flowered Cœlogyne longipes, and was introduced by Mr. J. W. Moore, Eldon Place Nursery, Bradford, with whom it flowered in March of the present year. *K. B.*, 194, 1898.

EXHIBITIONS AND MEETINGS.

NATIONAL DAHLIA SOCIETY.

THE National Dahlia Society held a remarkably fine exhibition at the Crysta Palace on September 2 and 3. On the whole there was an excellent competition if we exclude the classes for single varieties. The artistic value of the dahlia was not shown in the manner this autumn flower deserves, except by Mr. Treseder, of Cardift, who had a charming bouquet; and Mr. E. Mawley, who staged a handsome vase.

SHOW AND FANCY DAHLIAS.

In the nurserymen's class there were three competitors, all of whom showed flowers both in size and colour. Mr. J. Walker, Thame, gained first prize with a very brilliant set that consisted of William Powell, Rev. J. Goodday, Sydney Humphries, Arthur Rawlings, S. Mortimer, Florence Tranter, Daniel Cornish, Chieftain, Arthur Ocock, Shotesham Hero, Purple Prince, Golden Gem, Rebecca (self), Perfection, James Cocker, Buttercup, Mrs. Keith, Hercules, Dandy (self), and Kathleen in the back row; J. T. West, Miss Cannell, Duke of Fife, J. C. Vaughan, Mr. Glasscock, J. Standish, Virginale, Dorothy (self), Harrison Weir, Dorothy, Maud Fellowes, Harry Keith, Eclipse, Shirley Hibberd, Herbert Turner, Hero (self), Muriel Hobbs, Grand Sultan, Matthew Campbell, and Harry Turner, in the middle row; Mrs. Every, Nubian, Mrs. Gladstone, Mrs. Rawlings, Buffalo Bill, R. T. Rawlings, Duchess of York, G. C. Reid, Buffalo Bill (self), J. Walker, Mrs. J. Greaves, Royal Queen, Fred Smith, James Stevens, Mrs. G. R. Jefford, Victor, Mrs. Mortimer, Imperial, and Mrs. Langtry, in the front row; Mr. Walker's flower of William Powell was grand for depth and colour. The second prize was secured by Mr. Charles Turner, Slough, with fresh blooms; Mr. S. Mortimer, Farnham, third.

There were six competitors in the class for four dozen blooms and these two gross of blooms made a brilliant show. Mr. C. Turner, Slough, won premier honours with a very handsome set remarkable for their freshness. The back row contained J. Cocker, Harrison Weir, H Walton, Mrs. W. Slack, Imperial, Grand Sultan, G. Rawlings, Constancy, Miss Cannell, Dante, Goldfish, Statesman, Hon. Mrs. Wyndham, Prince Bismarck, Earl of Ravensworth, Shirley Hibberd, William Powell, Elsie Britton, Duchess of York, Matthew Campbell, Goldfinder, John Forbes, J. Hickley, J. Walker, John Standish, Maud Fellowes, Major Bartlett, Victor, Rev. J. B. M. Camm, Alice Emily, J. T. West, William Keith, Mrs. David Saunders, Prince of Denmark, Gloire de Lyon, John Bennett, Crimson King, Clara, Duke of Fife, Mrs. Gladstone, Arthur Ocock, R. T. Rawlings, Arthur Rawlings, Mrs. Saunders, Hope, Colonist, Flag of Truce, and Sunbeam; Mr. J. Walker, second; and Messrs. Keynes, Williams, and Co., third.

Out of five competitors Mr. W. Treseder, Cardiff, gained first prize for three dozen show and fancy dahlias with handsome shapely blooms of Arthur Ocock, J. T. Saltmarsh, J. Cocker, Colonist Henrietta, Agnes, Harry Keith, Emin Pasha, Rebecca, Mrs. P. McKenzie, W. Rawlings, William Powell, Prince Henry, J. T. West, Mrs. Gladstone, J. Vick, J. Cooper, Diadem, Lottie Eckford, Perfection, Muriel, Victor, Sunbeam, Peacock, Mrs. Langtry, T. S. Ware, Earl of Radnor, Goldfinder, Nellie Garrett, Florence Tranter, R. T. Rawlings, Duchess of York, Rev. J. Goodday, Maud Fellowes, Warrior, and Dr. Keynes; Mr. G. Humphries Kings Langley, Chippenham, second; and Messrs. Kimberley and Son, near Coventry, third. Mr. G. Humphries gained first prize for two dozen show and fancy dahlias, Miss Ethel Brittain, Goldfinder, Reliance, and Majestic being the best blooms; Messrs. Kimberley and Son, second; and Mr. M. V. Seale, Sevenoaks, third. There were four entries.

Mr. Stredwick scored for a dozen blooms, showing Daybreak, I. T. Saltmarsh and Professor Fawcett finely; Mr. J. R. Tranter, Henley-on-Thames, second; and Mr. W. Baxter, Woking, third The best dozen fancy blooms were shown by Mr. J. Walker, Thame, who had good examples of Rebecca, Mrs. Mortimer, S. Mortimer, Duchess of Albany, Buffalo Bill, Hercules, Professor Fawcett, Chorister, Mrs. Saunders, Dorothy, and Rev. J. B. M. Camm; Messrs. Keynes, Williams, and Co., Salisbury, second; and Mr. G. Humphries, third.

In the amateurs' division Mr. R. Burgin, St. Neot's, Hunts, secured the chief award for his dozen show and fancy dahlias, his collection containing fine flowers of Arthur Rawlings (premier show bloom), James Stephen, H. Eckford, and R. T. Rawlings; Mr. T. Anstiss, Brill, second; and Mr. T. Hobbs, Bristol, third; there were four entries. In the clase for eighteen show or fancy dahlias Mr. R. C. West, Northlands, Salisbury, came first, showing H. Walton, Duchess of Albany, and T. W. Girdlestone, in good condition; Mr. W. Mist, Igtham, second. Mr. S. Cooper, Chippenham, gained first prize for a dozen blooms, and Mr. C. F. Keep, Sunny Hill, Streatham, had the best six blooms, show and fancy varieties; Mr. E. West, jun., coming second. Mr. Burgin staged the best dozen fancy dahlias, and secured the award for premier blooms with a very fine example of Frank Pierce; Mr. S. Cooper, second. For six fancies Mr. R. C. West and Mr. E. Jefferies, Chippenham, divided the honours.

In the classes for six blooms of one variety, the best show dark dahlia was Rev. J. Goodday, shown by Mr. J. Walker; Mr. G. Humphries second with A. Rawlings. For a light dahlia Mr. R. C. West scored with Mrs. Gladstone, and Mr. J. R. Tranter second with the same variety. The best yellow variety was John Hickling, shown by Mr. J. Walker, Mr. Mortimer coming second with R. T. Rawlings. Mr. Mortimer was first for a red dahlia with James Stephen, and Mr. R. C. West second with Duke of Fife. Mr. Mortimer also had the best white dahlia with John Walker. Mr. J. Walker second with the same variety. Mr. Veale scored in the "any colour" class with Duchess of York. For a fancy dahlia Mr. J. Walker led with Comedian. Mr. J. Walker led with a striped dahlia, showing Rebecca grandly.

CACTUS DAHLIAS.

The class for eighteen bunches of cactus dahlias is always a most attractive one, and on this occasion five competed for the prizes, and Messrs. Burrell and Co., Cambridge, secured the chief award with a beautiful bright lot of fresh but medium sized flowers. The varieties were Regulus, Mimosa, Mary Service, Arachne, Mrs. Peart, Cinderella, Island Queen, Fantasy, Starfish, Britannia, Night, Keynes White, Harmony, Charles Woodbridge, Lucius, Cycle, and Fusilier. Messrs. Keynes, Williams and Co., Salisbury, secured second place, Keynes White and several new and interesting seedlings, notably The Clown and Captain Broad, being in the set; Messrs. J. Cheal and Sons, Crawley, third; and Mr. J. Stredwick, St. Leonards, fourth.

The chief honours for a dozen bunches of cactus dahlias, in distinct varieties, six blooms of each, were won by Mr. S. Mortimer, Farnham, with a wonderfully handsome set that consisted of Mary Service, Fusilier, Harry Stredwick, Miss A. Nightingale, Starfish, Night, Lady Penzance, Fantasy, Britannia, Charles Woodbridge, and Alfred Vasey. Mr. M. V. Seale, Sevenoaks, second; and Mr. G. Humphreys, King's Langley, third. The class for two dozen cactus dahlias, distinct, brought out nine competitors, and Messrs. Burrell and Co., Cambridge, came first with very fresh and bright specimens of Charles Woodbridge, Mrs. Peart, Zampa, Britannia, Regulus, Fusilier Improved, Cinderella, and Auburn in the back row; Harmony, Night, Presto, Oberon, Keynes White, Ajax, Lady Penzance, and Orient in the middle row; Acis, Lucius, Island Queen, Casilda, Antelope, Arachne, Madge Wildfire, and Mary Service in front; the second prize fell to Messrs. Keynes, Williams and Co.; while Messrs. J. Cheal and Sons, Crawley, came third, their set having a suitable accompanyment of dahlia foliage.

In the amateurs' division Mr. R. Keble, gardener to S. W. Sharpe, Esq., Twyford, won the first prize offered for a dozen bunches of cactus dahlias, distinct varieties, showing Matchless, Mary Service, Cycle, Mrs. Montifiore, J. E. Frewer, Mrs. G. Sloane, Starfish, Harmony, Mrs. A. Beck, Beatrice, Miss A. Jones, and Harry Stredwick; Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, second; and Mr. Mist, third. There were ten competitors in the class for six bunches of cactus dahlias, three flowers in each; Mr. A. Needs, Horsell, Woking, coming first with fine examples of Starfish, Charles Woodbridge, Gloriosa, Matchless, Mrs. Wilson Noble, and Mrs. Barnes; Mr. R. C. West, second; and Mr. E. Mawley, Berkhamsted, third. There was also an excellent competition in the classes for nine varieties of cactus dahlias in bunches of three blooms, Mr. H. A. Needs winning with a wonderfully handsome stand, in which Keynes White and Lady Penzance were grand; Mr. Keble, second; and Mr. J. Hudson, third.

SINGLE DAHLIAS.

Two splendid collections of two dozen varieties of single dahlias were staged, each variety represented by ten blooms in a bunch or spray. Messrs. J. Cheal and Sons, Crawley, gained the chief award with fine flowers of Mrs. Comminck, Jack Shephard, Amos Perry, Duke of York, W. C. Harvey, The Bride, Donna Cassilda, Duchess of Fife, Cleopatra, Miss Roberts, Beauty's Eyes, Demon, Yellow Satin, Alba Perfecta, Miss Linaker, Miss Henshaw, Aurora, Duchess of Marlborough, Naomi Tighe, Miss Morland, Miss Glasscock, Polly Eccles, Formosa, and Marion Hood. Mr. M. V. Seale, second. Mr. T. W. Girdlestone showed the best set of six bunches of single dahlias, winning with Naomi Tighe, Titania, Puck, Eric, Polly Eccles, and Donna cassidda; Mr. J. Hudson, second; and Mr. W. Mist, third; the competition for single dahlias showed a great falling off this year. In another class for single varieties, Mr. E. Mawley and Mr. J. Peters, Horley Station, were first and second respectively.

In the open class for eighteen varieties of fancy single dahlias in bunches of ten blooms each, Mr. T. W. Girdlestone won the chief award with Aladdin, Ruy Blas, Louisette, Suzette. Splosh, Phyllis, Folly, Creole, Trilby, Princess Petula, Tommy, Jeanette, Bal Masque, Jack Sheppard, Tommy Tucker, Violet Forbes, Ganem, and Nan; Mr. M. V. Seale, second; and Messrs. J. Cheal and Sons, Crawley, third.

POMPON DAHLIAS.

A grand display was made in the class for two dozen bunches of pompon dahlias as there were four exhibitors. The premier set was that from Mr. M. V. Seale, Sevenoaks, who showed beautiful blooms of Hypatia, Bacchus, Nellie Bromhead, Dr. Jim, Sunny Daybreak, Eva, Emily Hopper, Rosebud, Whisper, Tommy Keith, May Kirk, Phœbe, Lilian, Red Indian, Little Sweetheart, Douglas, Jessica, Ernest Harper, Ganymede, Distinction, Snowflake, Adrienne, Amber Queen, and Nerissa; Messrs. J. Cheal and Son, Crawley, second; and Mr. C. Turner third. For twelve bunches of pompon varieties, distinct, Messrs. J. Burrell and Co., Cambridge, led the way with Bacchus, Eurydice, Douglas, Whisper, George Brinchmann, Nerissa, Emily Hopper, Isabel, Tommy Keith, Arthur West, Janet, and E. F. Jungker; Mr. G. Humphries, second; and Mr. J. Stredwick, third.

The best set of six bunches of pompon dahlias in the amateurs' division came from Mr. G. Wyatt, gardener to G. Hilditch, Esq., Twickenham, and consisted of Bacchus, Nerissa, Dr. Jim, Little Sweetheart, Phœbe, and Tommy Keith; Mr. J. Hudson, second; and Mr. W. C. Pagram, Weybridge, third. For six bunches of six blooms each Mr. R. C. West was first; and Mr. C. F. Wood, Reigate, third.

DECORATIVE EXHIBITS.

The best vase of a dozen dahlia blooms was a handsome lot of scarlet flowers set up by Mr. G. Mawley; Mr. J. F. Hudson, Gunnersley House, second. For an epergne of dahlias Mr. J. F. Hudson was first, yellow single and cactus forms being extensively used; Mr. E. Mawley second. One dahlia bouquet was good, Mr. W. Treseder, Cardiff, winning with a charming arrangement, the variety Mabel Keith being used with croton and asparagus foliage; Mr. Seale, second. For three vases of dahlias Mr. R. Edwards, Sevenoaks, was awarded first prize.

NON-COMPETITIVE DISPLAYS.

Mr. T. S. Ware, Hale Farm, Tottenham, put up a large and effective display consisting of a large central mound of varied cactus varieties, flanked by [illegible] of pompon varieties of good form and colour. Mrs. Peart, Cycle, Night, Beatrice, Fusilier, and Mrs. Wilson Noble were foremost cactus forms among a good collection. From Messrs. J. Peed and Sons, Roupell Park, Norwood, came a pretty display of hardy flowers and foliage, and dahlias, the latter being represented by cactus, show, and pompon varieties. The statice and phloxes were good. Messrs. Carter, Page, and Co., London Wall, showed an extensive and bright collection of cactus dahlias, making a sloping bank, the flowers being arranged in vertical lines of one variety. This is a most inartistic method of display, but it contained fine sets of Octopus, Britannia, Beatrice, Lady Penzance, Charles Woodbridge, Night, Fusilier, Standard, &c.

From Messrs. Dobbie and Co., Rothesay, came a very fine display of cactus and pompon dahlias, the former put up in sprays of nine or twelve flowers. This big mass of colour was relieved by grass plumes, statice, &c. Some of the very best cactus dahlias, representing the pick of a very extensive collection, were Mary Service, Britannia, Lady Penzance, Beatrice, Starfish, Fusilier, Matchless, Night, Standard, Mrs. Fell, Miss Webster, Mrs. Peart, Mrs. Wilson Noble, Darkness, Fantasy, &c. Good pompon varieties shown were Bacchus, Whisper, [illegible] Little Dorritt, Lockett, Admiration, Agate, Hypatia, &c. Mr. J. R. Box, Croydon, and West Wickham, showed tuberous begonias, all this year's seedlings, staged in bunches amid maidenhair fern; all the blooms had been cut from the open ground, and were extremely fine for so dry a season as we have experienced. The variety of colours was specially good, from white to intense crimson. Mr. J. Green, Norfolk Nurseries, Dereham, put up a large display of pompon and cactus varieties, grouping them in sprays, boxes, bunches, &c.; Red [illegible], a new seedling represented by one flower, was an immense crimson scarlet [illegible] form over eight inches across.

ROYAL HORTICULTURAL SOCIETY, September 6.

A small meeting was held at the Drill Hall on the above date, and the attendance was somewhat small also. A grand specimen of that old and highly-fragrant orchid, Peristeria elata, shown from Her Majesty's gardens at Frogmore, Windsor, was one of the chief attractions of the show.

Floral Committee.

There was but a moderate display of plants and flowers, and novelties, except in dahlias, were by no means numerous or particularly striking.

Down the centre of the hall Mr. H. B. May had a tasteful exhibit of finely-grown Salvia splendens associated with Bouvardia Humboldti grandiflora, the white flowered Swainsonia galegifolia, and dwarf ferns beneath. At either end of the central group were smaller lozenge-shaped groups, one of Winter Cheer, Mrs. Leopold de Rothschild, Countess of Warwick, and Miss Joliffe carnations; and the other of a pretty double-white fuchsia, named Ballet Girl; silver Banksian medal. Messrs. J. Cheal and Sons, Crawley, put up a group of cut sprays of hardy shrubs, both foliage and flowering kinds; a few of the leading subjects were Hydrangea paniculata, Acacia neo-mexicana, Tamarix parviflora, Salix annularis, Rubus phœnicolasius, Sambucus argentea variegata, Diplopappus chrysophyllus, Spiræa callosa rosea, Ligustrum macrophyllum, Cæonothus Gloire de Versailles, Symphoricarpus folius aureus, Cornus siberica variegata, &c. Dahlias from Messrs. J. Cheal and Sons made a very bright and attractive display. Among the single sorts, Formosa, Mrs. L. Conninck, Amos Perry, The Bride, Naomi Tighe, Miss Roberts, and Miss Morland were very fine. Cactus sorts were also very beautiful, and especially pleasing forms were Austin Cannell, Arachne, King of Siam, Alfred Vasey, Chas. Woodbridge, Mrs. J. Goddard, and Fantasy. The pompon varieties were also very handsome, fresh, and bright. The whole display merited a silver-gilt Banksian medal. Mr. A. Pentney, gardener to A. J. Howard, Esq., Worton Hall, Isleworth, showed a group of freely-flowered streptocarpus, backed by several dozen spikes of brilliantly-flowered cannas. Ferns of sorts were used to set off the brilliant colours; silver Banksian medal.

Messrs. J. Veitch and Sons, Chelsea, showed three pretty forms of Hibiscus syriacus, viz., H. coelestis, H. monstrosus, white and red; and H. totus albus, pure white; they also exhibited a number of hardy nymphæas in small tanks of water; N. Laydekeri fulgens, N. L. lilacea, N. Marliacea chromatella, very fine; N. alba, N. Marliacea carnea, and N. M. alba were the best. The collection of annuals displayed by Messrs. J. Veitch and Sons, in competition for the Sherwood cups, was not such a bright group as staged at former meetings. The dry and hot weather of late has been against the prolonged flowering of many annuals. Sweet sultans, asters, scabious, phloxes, dianthus, salpiglossis, Cosmos bipinnata, and various sunflowers were the chief subjects on view. The Chelsea firm exhibited a small group of gladiolus, all Childsi hybrids, and carrying large, [illegible]-mouthed flowers of the greatest brilliance; silver Banksian medal. A group of fragrant roses, shown by Mr. W. R. Rumsey, Joynings Nursery, Waltham Cross, consisted wholly of blooms in various stages of development of the new bright rose-pink rose Mrs. Rumsey; this free-flowering bedding rose we have on many occasions already alluded to; bronze Banksian medal.

Ferns in great variety were staged by Messrs. J. Hill and Son, Edmonton, and in the large group we noted fine examples of Lastrea lepida, Gymnogramma Parsonsi, Asplenium caudatum, Pteris tremula Smithiana, Osmunda palustris, Woodwardia radicans, Nephrolepis rufescens tripinnatifida, and Cheilanthes elegans; silver Flora medal. From Messrs. F. Sander and Co., St. Albans, came a few small but well grown specimens of Acalypha Sanderi, A. Godseffiana, Dracæna Sanderiana, and a number of flowering examples of the brilliant and handsome Hæmanthus multiflorus superbum, a useful bulbous plant not nearly enough grown. Acalypha Novelty is the name given to a novel seedling acalypha raised by Mr. J. Wells, gardener to Mrs. Ravenshill, Woodside, Windsor Forest; it has creamy or yellowish leafage blotched with various shades of green; flowers, pale crimson. Mr. Baines, gardener to Sir Trevor Lawrence, Bart., Barford Lodge, Dorking, showed some fine pentstemons, and a tall-growing helenium named H. autumnale superbum.

Orchid Committee.

Messrs. James Veitch and Sons, Chelsea, contributed a large group of excellent orchids that made a most interesting display. Lælio-cattleya callistoglossa ignescens, L.-c. Nysa, L.-c. Eudora, Cattleya Warscewiczi, C. Eldorado, C. Euphrasia, and C. Harrisoniæ, were first-rate, as also were Disa Clio, Rodriguezia venusta, Dendrobium Endocharis, Renanthera matutina, Cypripedium Clinkaberryanum and Angræcum articulatum. This firm also sent a new Cattleya hybrid named C. Ella, a cross between C. Warscewiczi and C. [illegible]; a fine, rich, rosy flower, with deep purple lip; silver Flora medal. Mr. F. S. Stevens, gardener to Sir F. G. Freake, Bart., Warfleet House, Dartmouth, showed an almost pure white Dendrobium Phalænopsis, named Warfleet variety; it had a highly-coloured lip. Cypripedium Mrs. F. L. Ames was staged by Mr. Rodgers, gardener to O. O. Wrigley, Esq., Bridge Hall, Bury. Lælio-cattleya splendens, with rich, violet-purple lip, was shown by Mr. Bond, gardener to C. L. N. Ingram, Esq., Godalming.

Messrs. F. Sander and Co. showed Cypripedium Mrs. Edgar Cohen, a cross between C. callosum and C. niveum; this firm also sent C. William Trelease, a bold hybrid between C. Rothschildeanum and C. Parishi; the influence of the [illegible] parent was very notable in every segment. Mr. A. Vast, gardener to [illegible] Cohen, Esq., St. John's Wood, showed Lælio-cattleya elegans Cohen's var., an extremely strong-growing form with violet and purple apex to the large labellum; the spike carried seven or eight splendid flowers.

The most interesting orchid exhibited was a huge and splendidly-grown specimen of Peristeria elata, the Dove or Holy Ghost orchid, shown by Mr. Owen Thomas, gardener to Her Majesty the Queen; this carried eight strong spikes five feet high, and carrying an aggregate of nearly three hundred flowers and buds. A first class certificate was awarded for this old orchid, an award that scarcely seems justified, but the silver Flora medal awarded was thoroughly well merited, for not in recent times has such a fine example of high cultivation in this orchid been exhibited; it was a plant worthy of Her Majesty's establishment and her able gardener.

Fruit and Vegetable Committee.

Exhibits of fruit become more numerous and extensive at each meeting now, but it would be as well if exhibitors would remember that unripe fruits, or at least those out of character, are of no value at such gatherings as these.

A large and interesting collection of fruit was shown by Messrs. James Veitch and Sons, Chelsea; it consisted of some eighteen dishes of early dessert apples, [illegible] a dozen of pears, and nearly two dozen sorts of culinary apples. Long [illegible] of the John Downie crab, in fruit, were very handsome, while the pot [illegible] were most attractive, such sorts as White Marseilles, Negro Largo, and Bour-[illegible] Grise being well fruited. Peaches, figs, and plums were also well represented. A silver Knightian medal was awarded. Mr. J. Day, Galloway House, Gardens, Garliestown, sent Lord Napier nectarines and Early Grosse Mignonne peaches, the latter meriting a cultural commendation. Mr. J. Cole, Highly Manor Gardens, Balcome, showed some splendid Morello cherries. A fine new white-fleshed melon, named British Queen, was shown by Mr. Owen Thomas, gardener to Her Majesty at Frogmore.

Mr. C. Last, gardener to H. O. O'Hagan, Esq., River House, Hampton Court, showed magnificent Exquisite peaches, Pine Apple and River's Orange nectarines; a cultural commendation was awarded. Potatos came from the Chiswick Gardens, and several gained awards as noted elsewhere; some good onions also came from Chiswick, drawn from the trials made there. Mr. S. Robinsón, Ellesfield Gardens, Hollingbourne, showed large Sea Eagle, Lord Palmerston, and Princess of Wales peaches. Mr. J. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, sent three dishes of first-rate peaches. Messrs. S. Spooner and Sons, Hounslow, Middlesex, were awarded a bronze Banksian medal for a collection of apples, comprising about forty varieties.

Messrs. T. Rivers and Son, Sawbridgeworth, Herts, showed some splendidly-fruited plum trees in pots, the varieties being Jefferson, Burbank, Archduke, Victoria, Belgian Purple, Coe's Golden Drop, Pond's Seedling, and a seedling. Bunches of Buckland Sweetwater and Gradiska grapes were admired for their colour. This firm showed twenty grand examples of Peasgood's Nonsuch apple, wonderful for size and even shape. A silver Knightian medal was awarded. The Messrs. Rivers also sent a bunch of Centennial, a huge-berried, white, Australian grape of poor quality.

BATH FLORAL FETE, August 31 and September 1.

Established forty-three years ago, the authorities have held flower shows in Bath for the delectation of visitors ever since, the delightful Stanley Gardens being available for the purpose. The committee have had to contend with many vicissitudes; wet days have almost ruined their prospects at times, but they have held on—though their yearly shows have been reduced in number—holding the banner aloft through sunshine and storm. The late summer show is always an attractive one; it was especially so on this occasion, for it was one of the best ever held, and the day being brilliantly fine, a large company assembled and soon filled the various tents.

Fuchsias always take the leading place in the schedule of prizes. Bath and district has always been famous for specimen fuchsias, and on this occasion they were both finely and numerously produced. Mr. G. Tucker, Helperton, Trowbridge, who may now be regarded as the champion fuchsia grower of the West, had nine very fine specimens, of darks, Diamond Jubilee, a singularly bright variety of his own raising; Final, Bountiful, Dock Favourite, and Charming; and of light varieties, Western Beauty (Lye), very fine; Mrs. Bright, Arabella, and one other. J. H. Walters, Esq., Bath, was second, he had fine freely grown and bloomed bushes of Bountiful, Thomas King, Charming, Western Beauty, Beauty of Wilts, &c. Mr. A. Young, gardener to Lady Pitman, Bath, had the best six, the finest being Bountiful, Arabella, Charming, Letty Lye, &c.; second, Mr. H. Pocock, Trowbridge; third, Mr. W. A. Burford, Weston. Mr. G. Podger, Bath, had the best four; Mr. J. Lord, Batheaston, was second. Specimen dark and light varieties were also good.

Groups of plants, filling a space of one hundred feet, were a good feature ranged along the centre of one of the tents. Mr. James Cypher, Cheltenham, with some of those touches of artistic skill he puts into such works, came first; Mr. Tauser, gardener to W. R. B. Cater, Esq., Bath, was a good second; and Messrs. E. S. Cole and Son, Bath, third.

Cheltenham produced the best stove and greenhouse plants in pots, a very fine lot indeed; twelve were ornamental foliage and six in flower. Magnificent palms, brilliant crotons, &c., were staged in the best condition by Mr. Cypher; Messrs. E. S. Cole and Son were second; and Messrs. J. B. Woods and Son, Chipping Sodbury, third. Mr. Cypher had the best six in bloom, but was run very close by Mr. G. Tucker. The former had Phœnicoma prolifera Barnesi, Allamanda nobilis, Bougainvillea glabra, Statice profusa, and Ericas Austiniana and obbata purpurea. Mr. Tucker had fine specimens of Bougainvillea Sanderiana, Clerodendron Balfourianum, Ixoras Morsei and Fraseri, Allamanda nobilis, and a splendid Dipladenia Brearleyana. The best greenhouse plant was Statice Gilberti, from Mr. Tucker; Mr. Cypher coming second with S. intermedia. Mr. Cypher had the best stove plant in a fine example of Ixora Duffi; Mr. Tucker was second with another fine Dipladenia Brearleyana. Mr. H. Pocock had the best three plants, chief among them being Stephanotis floribunda.

Mr. Cypher had the best six orchids in Dendrobium formosum, Cattleya gigas, Lælia elegans, L.-cattleya Cypheri, Dendrobium phalœnopsis Schrœderi, and Cattleya Eldorado. He also had the best six heaths, and the finest specimen in Erica Marnockiana. The best new plant was Croton Nestor, from Mr. Cypher; Mr. G. Pymin, gardener to Mrs. Gouldsmith, Trowbridge, was second, with a bright seedling croton.

Zonal pelargoniums, cannas, liliums, gloxinias, cockscombs, and petunias were also shown; but, while good on the whole, they did not call for special remark. Tuberous-rooted begonias were represented by good specimens. Mr. H. Chisler, gardener to E. T. D. Foxcroft, Esq., Bath, had the best six doubles, and Mr. G. Tucker, the best six singles.

The display of cut flowers was numerous and fine. The best thirty-six spikes of gladioli, a very fine lot came from Mr. S. Bird, gardener to F. H. Fox, Esq., Wellington; Mr. J. Mattock, Headington, Bath, was second. Mr. F. Hooper, Bath, had the best twelve, run close by Mr. George Humphries, of Chippenham. Mr. Humphries had the best twenty-four dahlias, having in fine character the Rev. J. Godday, Earl of Ravensworth, Mr. Gladstone, Rebecca, Duchess of Albany (both sports), Reliance, Dr. Keynes, J. Wyatt, W. Rawlings, Vice-President, John Walker, James Vick, &c.; second, Messrs. Keynes, Williams, and Co., Salisbury; third, Mr. W. Treseder, Cardiff. Messrs. J. Cray and Son, Frome, had the best twelve, having good blooms of Excellent, Mr. W. Slack, Prince of Denmark, Duchess of York, Dr. Keynes, John Walker, Florence Tranter, &c; Mr. F. Lindsay, Frome, was second. With twelve fancies, Mr. G. Humphries gained the first prize, having capital blooms of Duchess of Albany, Sailor Prince, Dorothy, Mabel, Sunset, Mr. Saunders, Lottie Eckford, George Barnes, &c.; second, Mr. T. Hoskins, Kingswood. Mr. J. Burgess, Kingswood, had the best twelve bunches, clean, bright, but large—larger than we see them in London. Mr. T. Truckle, gardener to T. Carr, Esq., Tiverton, was second. Strange to say, neither the brilliant cactus varieties, nor the neat pompons find a place in the schedule. Roses were a very good feature. The best twenty-four came from Mr. J. Mattock, who had in fine character Her Majesty, Charles Darwin, Marchioness of Londonderry, Mrs. J. Laing, Charles Lefebvre, Horace Vernet, A. K. Williams, Madame Hoste, Duchess of Bedford, Duke of Teck, Maman Cochet, &c.; Messrs. Perkins and Son, Coventry, was second; and Dr. Budd, Bath, third. Mr. George Garraway, Bath, had the best twelve, his leading blooms were Mrs. J. Laing, Marie Verdier, A. K. Williams, Alfred Colomb, The Bride, Maman Cochet, &c.; second, Mr. A. A. Walters, Kensington Nurseries, Bath. Mr. Mattock also had the best twelve teas and noisettes, having in good character Maman Cochet, Madame Hoste, The Bride, Maréchal Niel, Madame Cusin, Comtesse de Nadaillac, &c.; second, Dr. Budd.

A very fine collection of twenty-four bunches of cut flowers of zonal pelargoniums was staged by Messrs. G. Cooling and Sons, Bath, remarkable for the novelties found in it; Mr. W. J. Mould was second. Asters were numerously shown, quilled, flat-petalled, and the Comet types being in much better character than was expected.

Mr. George Hallett, Bath, had the best twenty-four bunches of cut stove and greenhouse cut flowers, the usual subjects; Mr. G. Tucker was second. Mr. A. A. Walters had the best twelve bunches of hardy perennials, having in fine character Dracocephalum virgineum, Tritoma uvaria, lilies, montbretias, helianthus, lathyrus, &c.; Mr. W. Treseder was second; and Messrs. W. J. Stokes and Co. third. Mr. George Garraway had the best twenty-four bunches of hardy annuals; Mr. W. L. Jay was second. These represented some of the most showy subjects among annuals, and were much admired. Phlox Drummondi, German stocks, African marigolds, double zinnias, &c., were all shown in good condition.

The best dinner table decoration, soft and pleasing, was set up by Messrs. E. S. Cole and Co.; Mr. A. H. Freeman, Bath, was second. Mr. Cypher was first, with one of his delightful epergnes; and Mr. E. T. Hill, second. Messrs. Perkins and Son, Coventry, carried off the first prize for a hand bouquet, orchids largely composing it; and Mr. W. Treseder was second. Flowers in bowls, sprays, buttonholes, &c., were also shown.

Some good fruit was staged, Mr. W. Strugnell, gardener to Colonel Drexel Rood Ashton, Trowbridge, taking the first prize with eight dishes, having Muscat of Alexandria and Alicante grapes, Sea Eagle peaches, Pine Apple nectarine, Hemskirk apricot, plums, melon, and cherries; Mr. G. Pymm was second, having grapes, peaches, nectarines, &c.; Mr. T. Wilkins was third. The best eight bunches of grapes came from Mr. W. Taylor, gardener to C. Bayer, Esq., Forest Hill, who had in finely finished character Black Hamburgh, Madresfield Court, Gros Maroc, and Muscat of Alexandria; Mr. W. Allen, gardener to W. Marshall, Esq., Taunton, was second, with the same varieties. The best three bunches of Black Hamburgh came from Mr. R. E. Taylor, Bath, fine in bunch, but lacking colour; Mr. R. B. Malvern was second. With two bunches of Muscat of Alexandria A. R. Bailey, Esq., Frome, was first, with very good examples; and Mr. Taylor, Forest Hill, was second. The best two bunches of any other white was fine Buckland Sweet Water, from Mr. Marshall, gardener to J. Dole, Esq., Bristol; Mr. G. Sutton was second with the same. The best two bunches of any other black were Madresfield Court, from Mr. Taylor, Forest Hill; Mr. C. C. Tudway, Bath, was second, with Gros Maroc.

Melons were shown in two classes. The best dish of nine peaches was Barrington, from Mr. A. Cross; Mr. W. Powell, Bath, was second, with Barrington. The best dish of six was Exquisite. The best nine nectarines were Lord Napier, from Mr. J. Stevens; the best six, Pine Apple, from Mr. Strugnell. Greengage, dessert, and culinary plums were shown, also figs, cherries, nuts, and filberts. The best three dishes of pears were Beurre Clairgeau, Pitmaston Duchess, and Souvenir du Congrés, from Mr. W. Fisher, Batheaston. The best single dish, Pitmaston Duchess, from Mr. E. Hall. Mr. G. Garraway had the best three dishes of dessert apples in Worcester Pearman, Duchess of Oldenburgh, and Lady Sudely. The best dish was Lady Sudely, from Mr. E. D. Bourdillon. Mr. Garraway was first with three dishes of culinary apples, having Peasgood's Nonesuch, Ecklinville, and Emperor Alexander, very fine. The best single dish was Peasgood's Nonesuch, from the Rev. Y. Fawsett.

Vegetables were numerously shown, and finely, especially in the society's class for 12 varieties and in those in which Messrs. Sutton and Sons and Messrs Webb and Sons offered special prizes. Good potatos were shown in collections.

Miscellaneous exhibits filled a considerable space. Messrs G. Cooling and Sons had a large table of plants and cut flowers, also of apples and pears. Messrs. Jarman and Co., Chard, had cactus dahlias, lilies, including L. Nepalense, and other flowers. The Devon Chrysanthemum Nursery Company had dahlias and other cut flowers. Mr. J. R. Blackmore, Bath, had cut blooms of fine strains of double and single begonias. Messrs. J. Cray and Co., Frome, had a good collection of cut flowers of various kinds, and Messrs. E. Webb and Sons, Stourbridge the same. Mr. A. A. Walters also had collections of cut flowers, and Mr. J. Mattock some charming bunches of garden roses.

ROYAL AQUARIUM, September 6, 7, 8.

THERE was a very fair show at the Royal Aquarium on the above dates; dahlias and gladioli were first-rate, but chrysanthemums in the competitive classes were poor with but one or two exceptions.

Mr. Norman Davis, Framfield, had a very handsome collection of chrysanthemum blooms arranged in vases of various sizes and heights; the Desgrange varieties, Mdlle. Marie Masse, M. G. Grunerwalde, and Harvest Home were the leading sorts; Mr. Davis gained first prize and thoroughly earned it. For twelve blooms of Mdme. Desgrange, Mr. W. Perrin, gardener to C. W. Richardson, Esq., Sawbridgeworth, secured first prize with fine specimens; Mr. C. Crookes, Droitwich, second. Mr. Such scored for six bunches of early chrysanthemums. Miss Debenham, St. Albans, led for twelve trebles of early flowering chrysanthemums, showing California, Madame Gabus, and Piercy's Seedling in fine condition; Mr. E. Such, second; and Mr. G. J. Cook, Hendon, third. Mr. J. Rose, Plumstead, staged the best six blooms of any chrysanthemum, Madame Desgrange, showing them in a vase. Mr. W. C. Vince, Leyton, had the best epergne of chrysanthemums, Mr. J. Rose coming second, and Mr. A. Taylor, East Finchley, third.

Mr. J. Walker was almost invincible with show and fancy dahlias, winning the chief award for four dozen blooms, his set containing fine flowers of Goldsmith, W. Keith, Daniel Cornish, J. Downie, and J. T. West; Mr. Charles Turner, second; and Mr. Mortimer, third, out of five competitors. There was a fair competition in the class for three dozen show and fancy dahlias, and here Mr. J. Walker, Thame, just managed to beat Mr. S. Mortimer, Farnham; W. Keith, Prince of Denmark, Goldsmith, Hercules, and Glowworm were fine in the winning stand; Mr. C. Turner, third. Mr. Humphries, Chippenham, led for two dozen blooms; with Mr. J. R. Tranter, Henley-on-Thames, second. Mr. Tranter scored, however, for a dozen blooms, followed by Mr. G. Humphries and Mr. W. Baxter, Woking, in the order given. Mr. S. Cooper, Chippenham, led for twelve show dahlias; with Mr. E. Jefferies, second; and Mr. F. King, Romford, third. For six blooms Mr. C. F. Keep, Streatham, was first; and Mr. S. Cooper, second. In the class devoted exclusively to amateurs Mr. Jefferies scored for six show and fancy dahlias; Mr. Anstiss, Brill, second; and Mr. Cooper, third. Mr. Anstiss was the leading competitor in the class for eighteen show and fancy blooms, his J. Walker, Chieftain, and J. Cocker being very good.

Mr. S. Mortimer scored for a dozen bunches of cactus dahlias in the open class his best bunches being E. J. Deal, Britannia, Night, and Starfish; Mr. H. Shoesmith came second and Mr. J. Stredwick, third. For eighteen bunches, Messrs. J. Burrell and Co., Cambridge, made a splendid display, gaining first prize readily with a beautiful and fresh set. Messrs. Keynes, Williams, and Co., Salisbury, coming second. Mr. J. Hudson, Gunnersbury House, Acton, led with six bunches of cactus dahlias, open class; Mr. G. Wyatt, gardener to G. Hilditch, Esq., Waldegrave Park, Twickenham, second.

Mr. Charles Turner, Slough, obtained premier place for two dozen bunches of pompon dahlias, making a fine exhibit; Mr. F. W. Seale, Sevenoaks, second; and Messrs. Keynes, Williams, and Co., third. Messrs. Burrell, Mr. G. Humphries, and Mr. J. Walker were the prize winners in order for a dozen bunches of pompon dahlias.

Mr. J. Hudson, Gunnersbury House Gardens, scored for six bunches of pompon dahlias with Ganymede, Nerissa, Captain Boyton, Orpheus, Whisper, and Eric; Mr. G. Wyatt, second; and Mr. W. C. Pagram, gardener to J. Courtenay, Esq., Weybridge, third. Messrs Stredwick and Hudson were first and second respectively for six bunches of pompons.

Mr. T. W. Girdlestone was first for twelve bunches of single dahlias; Mr. J. Hudson, second; and Mr. R. Mist, Ightham, third. Mr. F. W. Seale scored for two dozen bunches of single dahlias.

A beautiful lot of gladiolus came from Messrs. Burrell and Co., Cambridge, who gained first prize with a collection of about seventeen dozen spikes, chiefly gardavensis forms, of great beauty and brilliance. Messrs. Harkness and Sons, Hitchen, second.

Mr. J. H. Witty, Nunhead Cemetery, Plumstead, had a very attractive circular group of chrysanthemums and ferns, gaining a silver-gilt medal. A silver medal was awarded to Mr. T. W. Seale, Sevenoaks, for a collection of show and cactus dahlias. Mr. J. Mattock gained a silver-gilt medal for a choice and fragrant collection of tea roses in bunches staged amid maidenhair fern. Mr. F. G. Foster, Havant, Hants, showed sweet peas in variety. Mr. T. S. Ware, Tottenham, put up a fine display of cactus and pompon dahlias, making an extensive group that attracted much attention; small gold medal.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, showed a large group of chrysanthemums, liliums, begonias, caladiums, &c., gaining a small gold medal. May Manser was a fine early Japanese chrysanthemum of a creamy-white hue, large and free. Mr. Jones also sent a good tomato named the Champion, a handsome, heavy, and smooth fruit. Mr. J. Green, Dereham, had an extensive display of dahlias, representing all sections; a silver-gilt medal. Messrs. H. Cannell and Sons, Swanley, gained a silver medal for a table of early flowering chrysanthemums; Harvest Home and Mrs. Pitcher were fine. Mr. J. R. Chard, Stoke Newington, was awarded a silver medal for a light arrangement of early chrysanthemums and berberis. Mr J Williams, Ealing, gained a bronze medal for table decoration. Mr. W. Wells, Earlswood Nurseries, Redhill, had a pretty table of early flowering chrysanthemums; Harvest Home, Arthur Crepy, and Mytchell White being prominent varieties; small silver medal. Messrs. Lawes and Co., had a stand of chemical manures; so also had the Icthemic Guano Company.

PEOPLE'S PALACE HORTICULTURAL SOCIETY,

September 1, 2, and 3.

THIS society includes a dahlia show as one of the four exhibitions it holds every year, and despite the dry weather some good blooms were staged. As a matter of course, the flowers which came from the more open parts, such as Leyton, Forest Gate, Walthamstow, and neighbouring places were larger and brighter than grown in the more crowded neighbourhoods, but the latter were highly creditable, and their quality showed what can be done in the face of trying, opposing forces. Some of the plants are grown in pots in order to have them under better control. As a rule, the show flowers were in many instances hard-eyed, owing to lack of moisture, and especially so was this the case in those districts in which there is a water famine. The cactus varieties appear to do better in crowded neighbourhoods than the show varieties, and it was seen that here the true cactus type was gradually elbowing out the broad petalled decorative varieties. Notwithstanding the dry season, there was to be seen an undoubted advance on the quality of last year, and this is a pleasing fact in connection with this society. Good specimens of lilies of the auratum and speciosum sections were shown; also asters in pots, and pretty bunches of garden flowers. The children contributed many plants of various kinds which they have to cultivate themselves. In the miscellaneous class, Mr. J. Ransom, Church Street, Bethnal Green, contributed a group of flowering and foliaged plants, which gained for him the award of the silver medal of the society. Among the friends of the society who contributed honorary collections, Mr. J. B. Riding, nurseryman, Chingford, set up a table of bunches of cactus and other dahlias which were very highly commended. It is gratifying to know these shows are well patronised by the residents in the locality.

SUTTON COLDFIELD GARDENERS' MUTUAL IMPROVEMENT SOCIETY.

THE annual excursion of members and friends of this flourishing society took place on Monday, the 29th ult., and Kenilworth and Stoneleigh Abbey Gardens were the places visited. Starting from the Town Hall, Sutton, at eight a.m., the party proceeded by brake to Stone Bridge Hotel, where a stop of half an hour was made to inspect the noted Stonebridge begonias, the beds of begonias being very much admired. Leaving Stonebridge the party proceeded to Kenilworth, where a substantial dinner was served at the Railway Dining Rooms. Here fresh brakes were obtained in which to drive to Stoneleigh Abbey Gardens, where the members of the society were met by Mr. Martin, the head gardener, who conducted the party over the grounds, including flower garden and well-kept and cropped kitchen gardens. In the latter department, the members were much interested in a fine bed of onions, viz,, Ailsa Craig and Lord Keeper, some of the bulbs measuring seventeen inches in circumference. Mr. Martin was liberally questioned as to when he sowed and how he treated to get such fine bulbs, and these questions it is hardly necessary to say he freely answered. After looking through the twenty-three glass houses, a return was made to the brakes, and the drive through the well-stocked and well-wooded deer park, which is specially rich in fine hardy trees, was much enjoyed. Arriving at Kenilworth, tea was partaken of, and at half-past six a start was made for Sutton in a steady downpour of rain. As the party consisted of gardeners, the weather did not damp their spirits, for they all acknowledged that they had spent an enjoyable time, and considered it the best excursion the society had made. On reaching Sutton the members expressed thanks to Messrs. Jenkins and Grover, the hairman and secretary, for the admirable arrangements they had made.

NEW BOOKS.

Work on a Kentish Fruit Farm. By A PRACTICAL MAN. (George Bunyard and Co., the Royal Nurseries, Maidstone.) Price 1s.—The name of the author of this brochure is not given, but Messrs. G. Bunyard and Co. state in the preface that the articles were contributed week by week to the *South Eastern Gazette* during 1897, and recognizing their merit they acquired the copyright for the purpose of publishing them in a separate form, and thus place the information they contain at the command of a larger number of cultivators of fruit and vegetables. The work may be described as a diary of commercial horticulture for the year, and as the author is fully conversant with the cultivation of both fruit and vegetables, and well acquainted with the metropolitan and other markets he has given much information of immense value to the cultivator of these crops for market. As indicating the character of the work, we make a few extracts which relate to seasonable subjects.

Writing under date of August 31, the author says:—

"This has been a week of rather bad weather for gathering and marketing. Although we have not had any extensive rainfall, the general conditions have been wet enough to hinder picking operations considerably. The careful fruit grower will never gather his produce when wet, and when we get frequent showers almost every day it will be readily understood how trying is the position. A good soaking wet day and fine weather afterwards is much preferable. The fruit has been gathered, as, of course, it must when ready, but the trouble of getting it must have been considerably increased.

"Apples and plums are the chief interest just now. It is the season for pears, but this year they are conspicuous by their absence. Apples and plums are coming to hand more plentifully than we have had them all the year, apples especially. The markets have been quite full enough during the last few days for the good of the trade. A great many growers are anxious to pick all the fruit possible before hop-picking commences, and no doubt this is the prime cause of the excessive sendings. This week will see most people busy with hops, and I shall then look for prices to improve. There have been several days of high winds to blow apples down. This is also a very common cause of a cheap day or two. After a wind everyone has more or less fruit that must be picked up and sold immediately.

"Plums and damsons are maintaining their prices well. The Victoria plum, one of the best and also one of the most popular among growers, is now in full season. The demand is very good, and the bulk of the fruit is of excellent quality. The thin crop has enabled the plums to grow out beyond their usual size. A few lots one sees—probably from some poor farm or from trees that have been heavily laden—are, however, of poor size and blighted appearance. The hot weather must have been very trying for trees carrying a big load. A good plan with this variety, and one practised by some of the largest growers, is to make two samples when packing, just as is done with apples. The best are then worth from 6d. to 1s. more than ordinary samples, and the seconds almost as much, as they are generally sold to jam makers, to whom size is not of importance.

"Damsons are undergoing a unique experience; they have jumped from being, a year ago, quite the outcasts of the trade, to probably the most sought after of any of our home-grown fruit of the season. The excitement to buy black currants early in the year was somewhat similar, but just at present I think the attention bestowed upon damsons is keener. The imports of foreign plums generally affect damsons very much, and so far this year the foreigners have not sent any appreciable quantity. There is plenty of time yet, the month of September being their fullest time, but I do not anticipate that damson growers have anything to fear as regards the price falling now. There are a great many contracts out for the fruit at good prices, and I rather think the contracts exceed the crop.

"The lesson growers ought all to learn from this season's prices is to make a big effort to get a crop next year. No doubt bad prices will come again, and possibly next year for some fruits, but the prospect for jam-makers' stuff is good; in fact, it could not be better. For fruits that are mainly sold for the retail trade, of course, the actual supply at the time rules the price, but the jam manufacturers must finish the season of 1897 a great deal short of what they could have done with, and will in consequence be good buyers another year, let the crop be ever so big.

"Cob-nuts and filberts have suffered a reverse during the week. The supply is very large indeed, and I suppose the same cause applies to them as to apples. Growers are anxious to get a certain percentage of them off before getting busy in their hop-fields. It is very difficult to keep cob-nuts from the petty thief, and therefore all exposed pieces, outsides, &c., have to be gathered before the pickers come down from London. This may be the cause of the glut in the markets. The nuts are really scarcely fit to offer for sale even yet, although so many have been sold. A good sample should have brown tips to the husks, or, better still, brown husks altogether, but those coming at present have no suspicion of the desired colour, and they heat if left a few days in the packages. A great many [illegible] growers pack too many into a basket. I have even seen a man treading them in with his foot. Of course this pressure bruises them terribly, and the tighter they are the more they heat. Nuts packed in this way come out like wet, warm rags, and then growers wonder the trade for them is bad. When cob-nuts get the desired brown tinge to them, and growers are busy hop-picking so that they cannot get them quite so fast, I shall look for the price to harden, not very much perhaps, but certainly a little. The prospects for selling them are extremely good this season, and when they will keep a little time I feel confident the northern markets will want them in considerably increased quantities. Prices for the day are: Best cooking apples, 4s. 6d. per bushel; seconds, 2s. 6d. to 3s. 6d.; best dessert, 4s. to 5s. per half; others, 1s. 3d. to 2s. Best pears, 5s.; common [illegible], 1s. 6d. Plums, best sorts, 5s. 6d. to 7s. Damsons, 5s. Gages, 7s. to [illegible] 6d. per half. Filberts, 2½d.; cobs, 3d. per lb. Potatos, 3s. 6d. to 4s. 6d. [illegible] cwt."

With regard to the gathering and marketing of cobs and filberts, the following useful advice is given: "Growers are now beginning to send filberts in a green state to market. It is full early to do so yet. The kernels are not uniformly developed, one nut on a bunch being quite forward, while his neighbour has nothing worth eating in it. This operates against the trade, as buyers will not give long prices for nuts not fit to eat. The big crop of cob nuts that we undoubtedly have is making growers too eager to be at them. I would remind my readers that this district has to grow cob nuts for all the rest of the world, and that every year new outlets for disposing of them increase much faster than the plant. Last year we saw cobs rise in price from thirty to sixty shillings. This year we shall have them selling at twenty five shillings all through the early part of the harvest, but I venture to prophesy that they will go to forty before Christmas, in spite of the big yield. Cob nut growers, as a rule, do their utmost to spoil the sale of their produce by the way they send it to market. I said a good deal last year on this subject, and I think it will bear repeating. The thing I have chiefly in mind is that of sending big consignments by jerks and jumps. A grower hears nuts are selling a little better than they have been; he and his fellow growers promptly get a few hands together and send a ton to market, when, as a natural result, markets are flooded for a time and prices go down.

"A few words will show how badly this rising and falling operates on the general trade. As soon as our friend has sent his ton of cobs and the price is down, say, to 3d., he stops sending till things improve! This is a very wise policy, no doubt, but how about the buyer? He has been buying at the reduced price, has been doing rather well out of them, and comes to market quite prepared to buy as many or possibly more than he did before. But he finds the reduced supply has forced the price up to 4d. (a penny is a big rise). This completely upsets his calculations as to the quantity he can sell, so he buys a few only. Meantime the grower again has heard of the rise, and sends another big load; result, another glut and fall in values, even to a point lower than before. This is no overdrawn picture, but is actually how the trade has gone every season for some time. If growers would send regularly, say, three times a week, just about as many as the size of their growths warrant, it would vastly improve trade, steady prices, and ultimately redound to the permanent good of everyone interested."

The gathering and storing of fruits receives, as a matter of course, a full share of attention, and with reference to the first of these two operations, the following suggestions are made:—

"It will soon be time to think about and make preparations for the ingathering of the keeping kinds of apples and pears. This part of the fruit-grower's business appears to me to be quite one of the most important operations in the yearly round, and yet it is one that is oftentimes, I may say generally, done in a most slip-shod way. Good fruit that has been allowed to hang on the trees and become well coloured and ripened will not stand being gathered in sack-pockets—the usual method—and ruthlessly shot into a heap. I have often written about this matter of gathering storage fruit, and I propose devoting a portion of my next letter to the subject. My advice will then come at the precise time when this work is going on. King Pippins in exposed or forward situations may be gathered now. I think the majority of them will be left another week or ten days, but it is by no means a bad plan to secure a portion of one year's growth of this particular kind, lay them fairly thick to induce rapid ripening, and thus get them sent to market before the general run of the Kings are ready. There is always a good opening for coloury samples of this apple in October. An open lodge, or any temporary protection in the orchard, serves as well for this purpose as a good building, as the fruit must all be sold before there is any risk of harm from frosts. It is not necessary to take such elaborate care of King Pippins gathered in this way for a rapid colouring as should be meted out to Wellingtons and Blenheims. They will take no harm from the gathering sack process, and they can be laid in a heap straight from the trees without being examined for maggoty and diseased specimens. They should be laid thickly, say, three or four feet in the centre, have no covering immediately on the top in order to allow the heat plenty of room to evaporate, have good roof protection so that no rain can come on them, and not too much air. In this way the apples will soon set up a rapid heat, and in about three weeks from the time of laying down will be ready for market, and will probably realise quite as much money per bushel as the later and more carefully-handled gatherings. It should be quite understood that I do not advocate the foregoing method if the fruit is meant to be stored any length of time.

"Good apples this year promise to sell at values that will pay for extra trouble, no matter how costly it may appear on the face of it. As I said in my last letter, the gathering flap pocket so generally used should be discarded when gathering the best fruit, and a small basket, such as is used for cherry picking, substituted; one holding from three to four gallons will be found the most handy size. The basket must be lined with a piece of old sacking or some similar soft substance, and have a hook attached with which to hang it on to the steps of the ladder, or possibly a limb of the tree. The first few fruits picked should be very carefully placed in the basket, not dropped in, and throughout the whole operation the picker should take care his basket is never violently jolted about, or, in fact, anything done to make the fruits jolt over one another. When full the small baskets should be emptied into bushel or half-bushel sieves, the same care being used. The apples should be placed, and carefully run through the hands, not shot, in the sieves. With Wellingtons especially every apple should be separately handled in transferring them."

On the all-important question of storage the author observes: "For conveying fruit to the store a spring van only should be used. A good bed of wheat straw—none other is good enough for the purpose—should be made to store apples in, care being taken to put an extra thickness wherever there is the least sign of a draught that would admit frost later on. Everything depends upon the next step. Seldom is enough pains taken to lay the fruit down properly. The prevailing practice is to bring the basket straight into the store and tip the apples as gently as may be into a heap on the bed. This treatment is not good enough. The proper way is to have women at the heap; the baskets should be brought to them and the fruit handled out, every apple being examined. The sound ones should be put in the main heap, and all diseased or faulty ones in a separate heap. This may seem a rather extravagant proceeding, but it will be found that it can be done for considerably under a penny a bushel, which best fruit will repay in shillings. Treated in this way the minimum of waste is incurred, and the heap of sound fruit will keep much longer than if mixed as gathered.

"A dark place is best for storing apples, the ground floor being preferable to one raised, although much excellent fruit has been laid upon the oast-house floors so common in the county, and has done well there. For keeping a long time the fruit should not be laid too thickly, two feet to two and a-half feet being ample. The thicker the heap the sooner the stage of sweating is reached, and if laid very thick apples will not survive this process very long. For this reason it is good to lay fruit for rapid colouring and early marketing as thickly as possible. On no account should the fruit be covered till one is compelled to do so to protect it from frost. Wellington apples are about the most liable of any of our sorts to take harm from careless handling, and at the same time they are one of the most valuable varieties. I would specially caution growers who have any crop of this sort to take great pains with them. Prospects for the selling of such apples are probably better than we have known for very many years."

In addition to the fifty-two articles dealing with cultural matters and market affairs, selections of the best market fruits are given, and, representing as they do the combined knowledge of the author and Messrs. Bunyard and Co., they are to the planter for profit worth at least twenty times the cost of the whole work.

MR. ROBERT CUBBON, head gardener to R. Alston, Esq., Harold Hall, Bedford, has been appointed head gardener to Thomas Hughes, Esq., Dudlow Grange, Wavertree, Liverpool.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Roses.—A. H., Barton: Eugénie Verdier and Marie Finger are now considered so much alike as to be regarded as synonymous, where exhibitors are concerned. With regard to the temperature of water for destroying green-fly, there is no doubt that 150 degrees in the work mentioned is a misprint, as tender rose shoots would not stand that heat; 120 degrees is sufficient to kill the fly, while it does not damage the plant.

R.H.S. Committees.—J. J. B., Battle: The next R.H.S. meeting takes place on Tuesday, September 20th. Your melon should be addressed to Mr. S. T. Wright, Superintendent, Royal Horticultural Society, Drill Hall, St. James's Street, Victoria Street, S.W. It should be securely packed, carriage paid, and timed to arrive at the Drill Hall before 12 o'clock on the 20th inst. Send the Secretary, R.H.S., 117, Victoria Street, S.W., a notification of your intention to exhibit.

Thrips on Ferns.—F. J., Norwood: Syringe the ferns with tobacco liquor in which a little soft soap has been dissolved, as this will make it more adhesive. Take care to syringe well under as well as over the fronds. If possible do the syringing in the evening, and then by ventilating early in the morning the odour will pass from the conservatory. Continue with the tobacco mixture on several successive evenings, and then give a thorough syringing with clean water. Frequent syringings will be necessary to prevent a repetition of the attack.

Garden and Greenhouse.—Ajax, Whitby: Two good works that should suit you are "The Amateurs' Flower Garden" and "The Amateurs' Greenhouse and Conservatory," 3s. 6d. each, Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C. The whole of the information you desire is not contained in any one book of small size or price. If a handbook of kitchen garden work and fruit culture is needed "The Amateurs' Kitchen Garden" may be added; same price and publishers.

Grapes Shanking.—W. H., Middlesex: It is a bad case of shanking, and due, no doubt, to a moist and close atmosphere. The disease was aggravated by the sulphuring and syringing. It is also probable, judging from the main stem, that the roots have been, or are, much too dry; this, of course, you will be best able to judge, and rectify the evil if it exists. Nothing can be done to save the crop if all the bunches are as bad as the one sent. Give more air, and leave some on all night; when applying water to the borders commence early on a warm, bright day, so that when the air is reduced at night there will not be a danger of much atmospheric moisture.

Protecting Carnations.—S. C., Ashtead: The carnations should have been layered, as the woody central growth is very apt to split or canker during winter. Peg down the leading shoots so that the wind may not break them, and then, at the approach of severe weather, cover the woody stock with finely-sifted soil, ashes, or cocoanut-fibre refuse. In the case of young plants, if they were layered early, well rooted, and planted out as soon as possible, there should be but few casualties during the winter. Keep a few plants in pots in a cold frame, so as to fill any gaps that may appear in spring. Niphetos is a good white-flowered zonal pelargonium for bedding.

Carnations and Roses.—Heligoland, Wellingborough: A dozen good garden carnations are Raby Castle, Ketton Rose, Joe Willett, King of Scarlets, Duchess of Fife, Seagull, Duke of Orleans, Mephisto, Germania, Niphetos, Mr. Reynolds Hole, and Bendigo. See recent articles in these columns for newer varieties. Your query anent roses is so put that we fail to understand your needs beyond a selection of button-hole and tea and hybrid tea varieties. Six good button-hole roses are—W. A. Richardson, Madame Chedane Guinoisseau, Ma Capucine, Isabella Sprunt, Duke of York, and Homere. Six good tea-scented roses—Souvenir de S. A. Prince, Catherine Mermet, Madame Cusin, Comtesse de Nadaillac, The Bride, and Madame de Watteville. Six good hybrid tea roses are—Caroline Testout, La France, Vicountess Folkestone, Lady Mary Fitzwilliam, Grace Darling, and Kaiserin Augusta Victoria or Augustine Guinoisseau.

Japanese Chrysanthemums at the Aquarium.—P. F.: The forty-eight Japanese chrysanthemums shown by Mr. W. Mease at the N.C.S. exhibition of 1897 were all distinct, and the varieties, as recorded in the GARDENERS' MAGAZINE of November 13, p. 717, were as follows: Back row—Madame Carnot, Etoile de Lyon, Mrs. W. H. Lees, M. M. de Rochetierre, Baronne A. Rothschild, J. Brookes, Mrs. C. H. Payne, Viviand Morel, Mons. Panckoucke, Eva Knowles, Pride of Exmouth, A. H. Wood, Lady Hanham, Simplicity, Australie, and Yellow Madame Carnot; middle row—Phœbus, Mrs. Dewar, Julie Scaramanga, Mutual Friend, Mrs. G. Carpenter, Madame H. Hoste, Charles Davis, Mrs. Blick, Chenon de Leché, Australian Gold, E. Molyneux, Mrs. J. Lewis, M. Gruyere, Edith Tabor, Madame Hoste, and Lady Ridgeway; front row—Mrs. C. Weeks, Mons. C. Molin, Colonel Chase, Sunstone, Madame M. A. de Galbert, Modesto, Madame R. Ricaud, Baron Fait, Niveus, Mrs. Briscoe-Ironsides, Madame Gustave Henry, N.C.S. Jubilee, Elsie Teichman, Robert Powell, Robert Owen, and Viscountess Hambledon.

Names of Plants.—H. S. W., Kilburn: 1, Hibiscus syraicus; 2, Asplenium bulbiferum; 3, Pteris tremula.

G. G., Wandsworth: Your orchid is Oncidium barbatum, a somewhat variable species, especially as regards the size of the flowers.

W. D., Nobblethorpe: 1, Taxodium distichum; 2, Ginko biloba (Salisburia adiantifolia), the Maidenhair tree; 3, Lysimachia lanceolata.

Names of Fruits.—E. C. K., Douglas, I. of M.: The pear is Belle Julie, and the apple apparently a deformed Ecklinville.

A. S., Maldon: 1, Red Astrachan; 2, Newtown Pippin; 3, not in condition; 4, Lord Grosvenor; 5, Cardinal; 6, Mère de Menage.

MARKETS.

Covent Garden.

THERE is a fair supply of fruit, both home grown and imported, and the demand is good; grapes and greengages sell well. Vegetable supplies are moderate and good.

FRUIT.—English apples, 3s. to 10s. per bushel; English grapes, 1s. to 2s.; Channel Islands, 6d. to 1s. per lb.; Denia, 5s. to 9s. per barrel; French pears, 3s. to 6s. per case; Dutch, 2s. to 2s. 6d. per molly; English, 4s. to 6s. 6d. per bushel; plums (Victorias), 3s. to 5s.; Orleans, 2s. 6d. to 4s. per half-sieve; French, 2s. to 3s. per case; French greengages, 9d. to 1s. 3d. per box; English, 3s. to 5s. per half-sieve; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 5s. each: green figs, 9d. to 1s. 3d.; peaches, 1s. to 6s.; nectarines, 2s. to 8s. per dozen; English melons, 9d. to 1s. 6d. each; Spanish, 4s. to 6s. 6d. per case; lemons, 10s. to 20s. per case; English tomatos, 3d. to 4d.; Channel Islands, 2d. to 3d. per lb.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 8s.; Odontoglossum crispum, 1s. 6d. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; asters, 2s. to 12s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; pansies, 1s. to 2s.; pelargoniums (scarlet), 3s. to 5s. per dozen bunches; stephanotis, 1s. to 2s.; lily of the valley, 1s. to 1s. 6d.; white gladiolus, 8d. to 1s.: and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Valencia onions and Ports, 5s. to 6s. per case; English, 2s. to 2s. 6d. per dozen bunches; peas, 2s. to 3s.; French beans, 3s. to 4s.; scarlet runners, 2s. 6d. to 3s. 6d. per bushel; mushrooms, 3s. to 6s.; eschallots, 1s. to 2s. per 12 lb.; parsley, 2s. to 2s. 6d.; mint, 1s. 6d. to 2s.; carrots, 2s. to 2s. 6d; turnips, 2s. to 3s. per dozen bunches; celery, 12s. to 15s. per dozen rolls; cabbages, 4s. to 5s.; marrows, 3s. 6d. to 5s.; beetroots, 2s. to 3s. per tally; lettuce, 9d. to 1s. per score; cucumbers, 1s. 6d. to 3s. 6d.; cauliflowers, 1s. to 2s.; endive, 1s. to 1s. 4d. per dozen; potatos, 60s. to 100s. per ton.

Borough Potato Market.

Fruit picking and other farm operations tend to keep the market supplies of potatos down, but there is not a very keen demand, so prices practically remain the same as last week. Beauty of Hebron, and Snowdrops, 4s. to 4s. 6d.; White Hebrons, Early Puritans, Sutton's Early Regents, Reading Giants, and Imperators 4s.; Black Lands, 3s. to 3s. 6d.

THE WEATHER DURING THE WEEK ENDING SEPTEMBER 3, 1898.

The mean reading of the Barometer during the week at Greenwich was 29·98 inches, and that of the Thermometer 61°·1, the latter being 1°·1 above the week's average in the 50 years 1841—90. The direction of the wind was westerly, the horizontal movement of the air being 30 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 60·7 hours. The measured rainfall amounted to 0·08 of an inch.

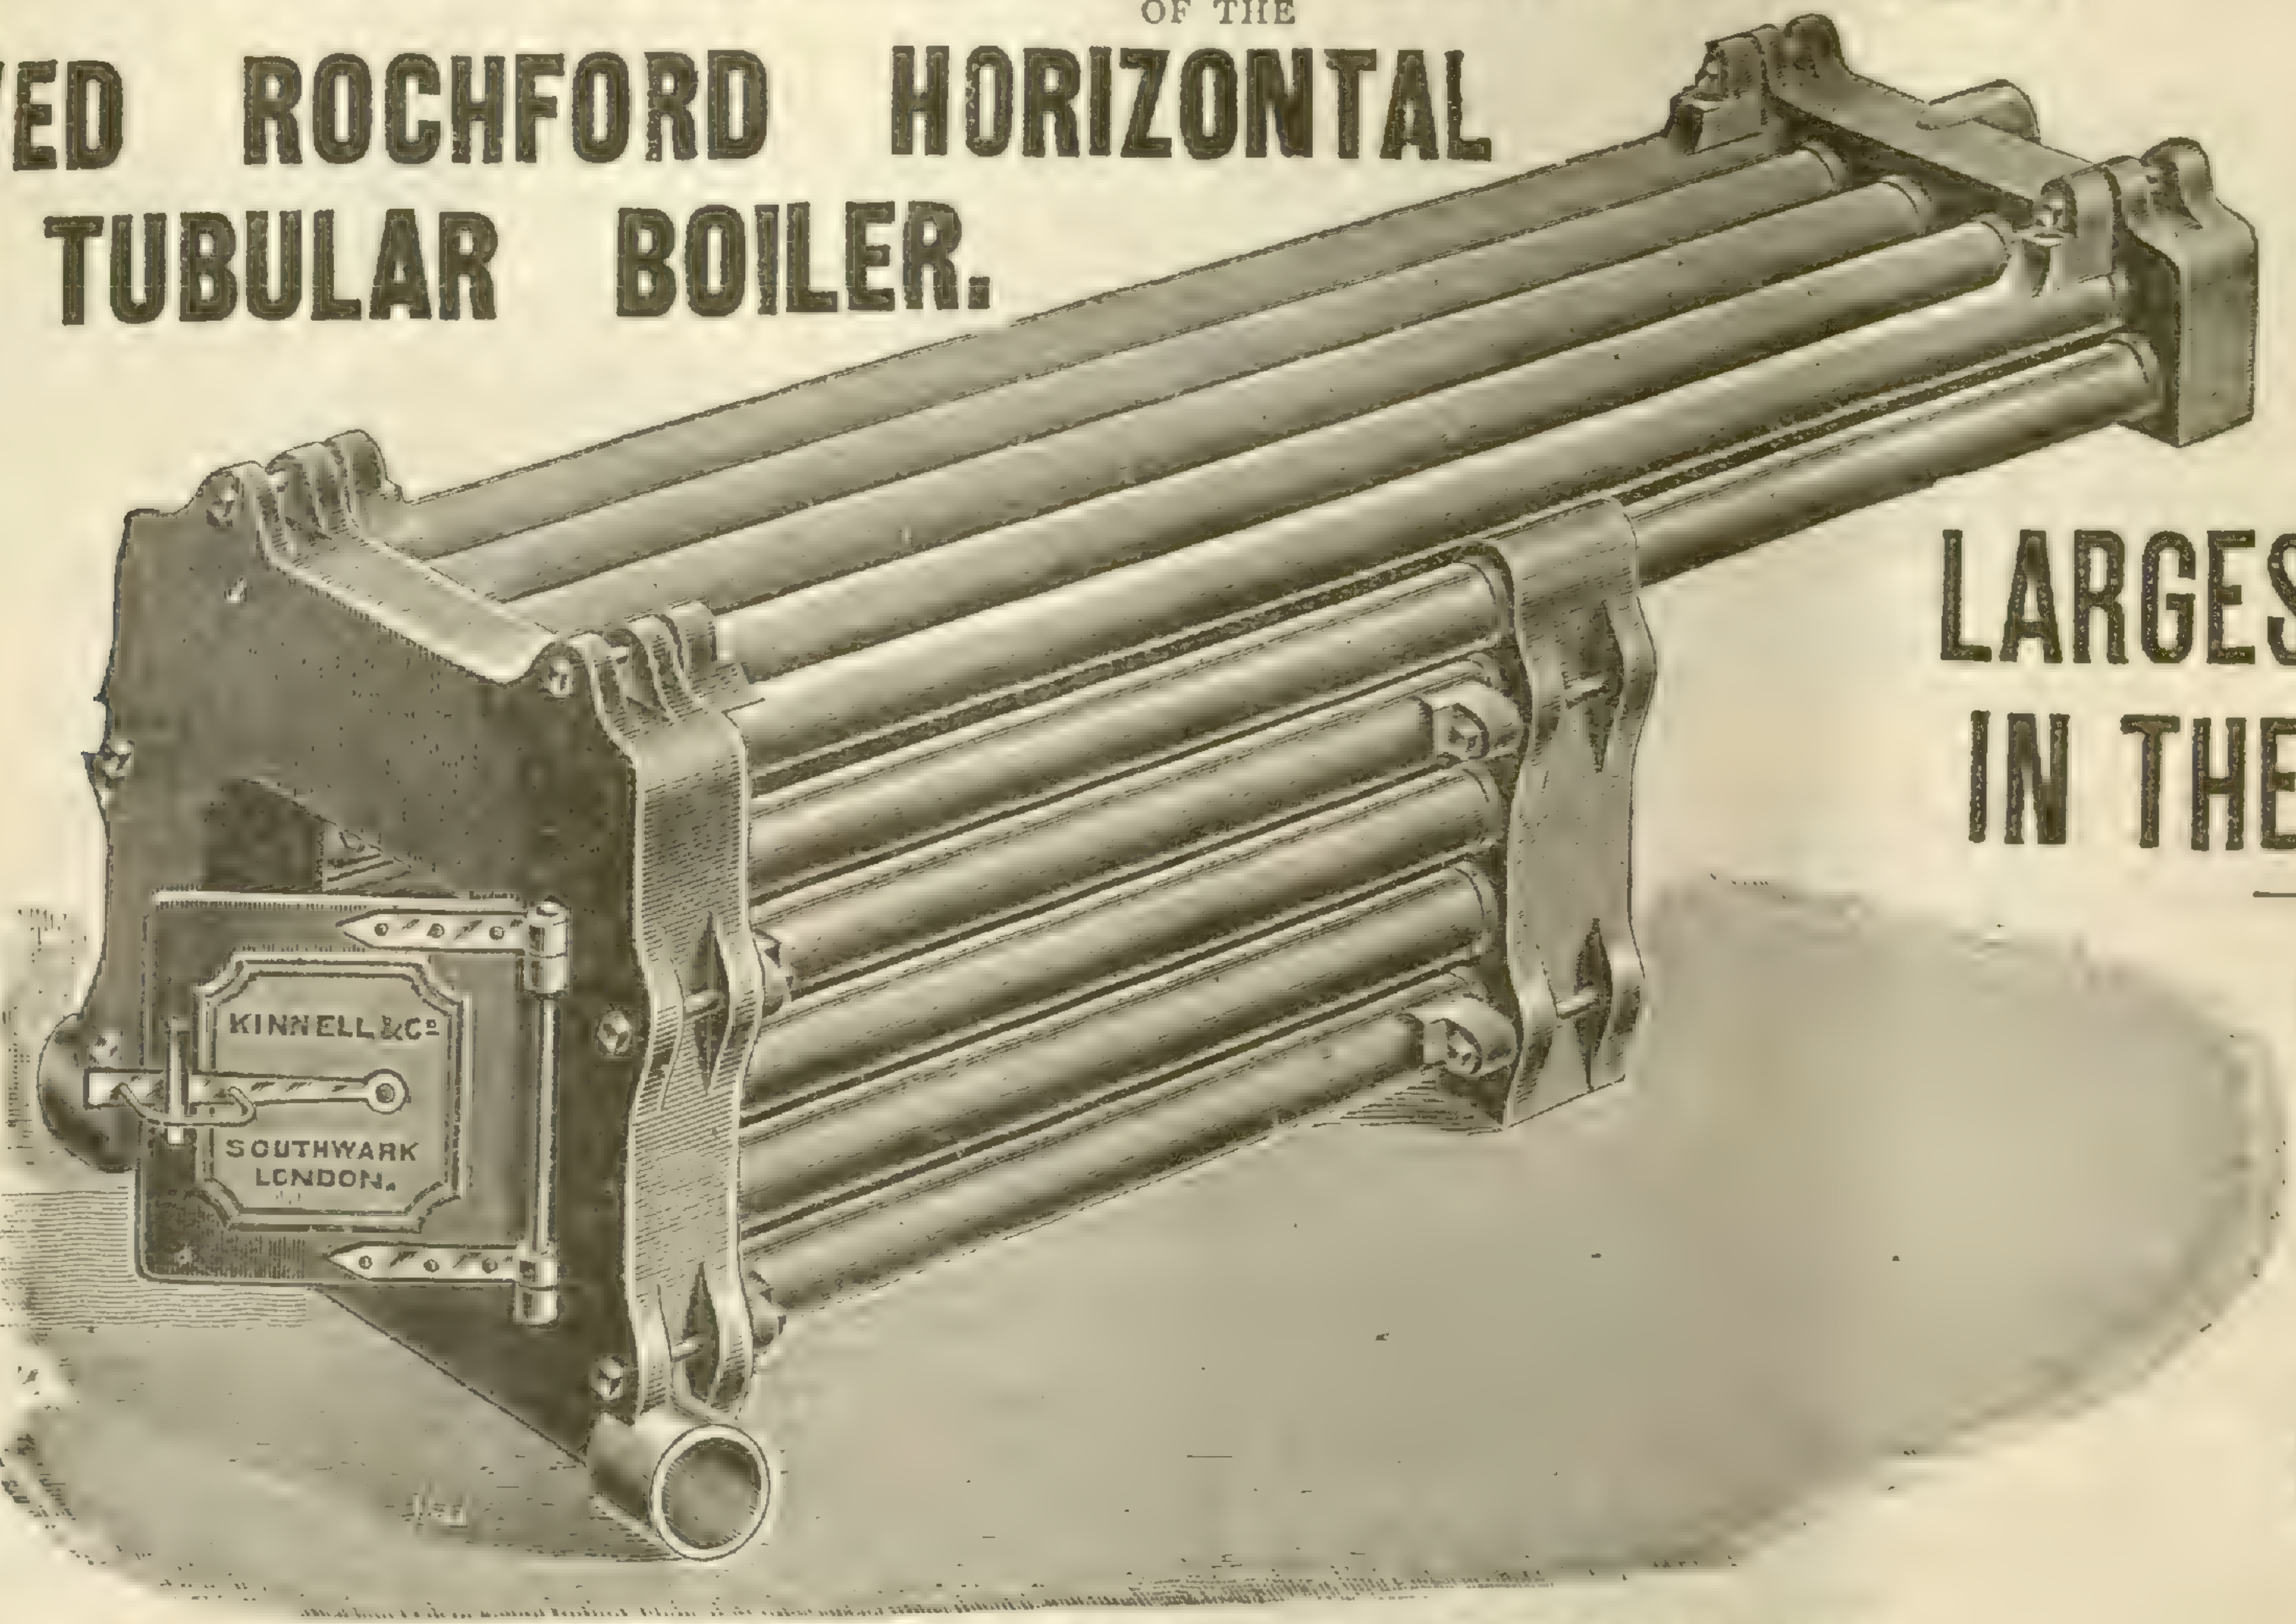
OVERHEARD IN A 'BUS.—"Sir, you are a clumsy fellow—you trod on my foot." "I am extremely sorry—I hope I did not hurt you very much." The soft answer turned away the other's wrath, and even produced an apology. "Oh, no, not very much—you must excuse me, I am a little irritable—fact is, out of sorts, liver, biliousness, and that sort of thing. [illegible]" "My dear sir, of course I excuse you, but why don't you [illegible] thing [illegible]" "Tried everything—no good." "Nonsense, you haven't tried Holloway's [illegible] know—they never fail in cases like yours." "Gad! I never thought of 'em. [illegible] 'em at once. Hi! conductor, stop the 'bus."—[ADVT.]

CHAS. P. KINNELL AND COMPANY,

SOLE LICENSEES AND MANUFACTURERS
OF THE
IMPROVED ROCHFORD HORIZONTAL TUBULAR BOILER.



Specialities
FOR
Greenhouse
Heating.

LARGEST STOCK IN THE TRADE.

ENGINEERS SENT TO ALL PARTS.

Plans
AND
Estimates Free.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.

To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.

Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

Offices and Warehouses, **SOUTHWARK STREET, LONDON, S.E.**

RUSTIC ADORNMENTS
FOR
HOMES OF TASTE.
BY THE LATE SHIRLEY HIBBERD.
New and Revised Edition by the Editor of AMATEUR GARDENING.

"This new and revised edition maintains its position as something more than an ordinary amateur's guide; it is a standard work brought up to date so as to keep abreast of taste and tastes as displayed in the floral decorations of the home, the home, and the garden. This work would make a useful present to anyone."—*The Bazaar, the Exchange and Mart.*

"We cannot imagine a more appropriate presentation book than this to persons who delight in flower and attractive home surroundings. It is worthy a place in any 'home of taste.' It abounds in useful practical hints, and is eminently readable from end to end."—*Journal of Horticulture.*

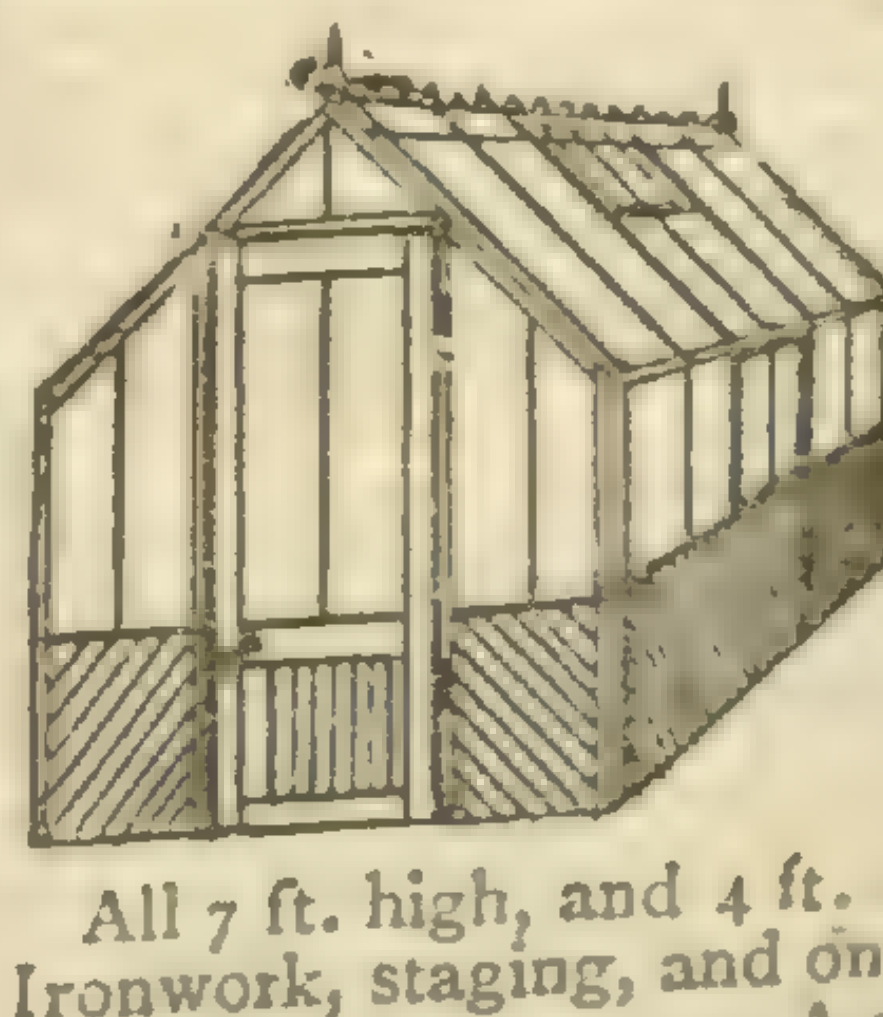
SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong [illegible]. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, [illegible] though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of [illegible] is also much improved by having the boarding [illegible] beaded (we have still a few of the lighter make [illegible] proportionately lower). All goods on approval [illegible] Sample end first if desired. Special arrangements for [illegible] It will please others if you buy elsewhere, it will [illegible] you buy from us. So please yourself!



Size.	Lean-to.	[illegible]
8 X 5 ...	[illegible]	[illegible]
10 X 5 ...	[illegible]	[illegible]
14 X 6 ...	[illegible]	[illegible]
10 X 8 ...	[illegible]	[illegible]
14 X 8 ...	[illegible]	[illegible]
14 X 10 ...	[illegible]	[illegible]
20 X 10 ...	[illegible]	[illegible]

All 7 ft. high, and 4 ft. sides (a few 5 ft. [illegible]). Ironwork, staging, and one coat paint included.
A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more.

Speculate in a sample end, and set your doubts at rest.

THREE INSERTIONS FOR THE PRICE OF TWO!

A LADY, giving up her establishment, wishes to highly RECOMMEND her gardener (Head-Working); experienced in all branches; married; fifteen years' character.—J. M., The Gardens, Eversfield, Reigate.

AS GARDENER (Single-handed or with boy); thoroughly experienced, Inside and Out; good reference.—Apply, F. C., 24, Bennett Street, Buxton, Derbyshire.

AS UNDER-GARDENER (Inside) in good establishment; has had experience with vines, melons, stove, and general plant work; age 24; fourteen months in present place, six years previous; bothy preferred.—W. PINE, Winslade Gardens, near Exeter.

AS SECOND (where four or more are kept, or small place where help is given); understands glass, fruit, flowers, and vegetables; six years in last place; age 30; single; good references.—ABBOTT, Wetherden, Stowmarket, [illegible]

AS GARDENER (Single-handed); experienced; Inside and out; good reference; three years present place; age 23; abstainer.—Apply J. G. C., 8, Warners' Lane, Church Gate, Loughborough.

AS GARDENER (Single-handed or otherwise); good experience; married; age 31; one child, seven years' good character.—B., 2, Chislehurst Road, Orpington, Kent.

FOREMAN in medium establishment; age 25; nine years' practical experience; bothy preferred.—SAMUEL A. BASSIL, The Old Pond, Turners' Hill, Cheshunt, Herts.

FOREMAN. — Joseph Forsey, Stanford Hall, Loughborough, would be pleased to highly recommend a young man, aged 27, to any Gardener requiring the service of an energetic and practical man of fourteen years' experience in leading gardens.

FOREMAN.—George Picker, The Gardens, Hesslewood, near Hull, would be pleased to RECOMMEND his Foreman, George Sage, to any gardener requiring the services of a reliable young man; age 27; the cause of leaving, the breaking up of the establishment.

GARDENER.—Admiral Sir W. G. Luard wishes to RECOMMEND his Gardener as HEAD, where two or more are kept; thorough practical man inside and out; ten years' reference; age 30; married, one child.—R. S., Lodge Cottage, Witham, Essex.

GARDENER (Head-Working, or good Single-Handed); age 29; married, one child; fourteen years' experience, Inside and Out; thoroughly understands fruit, flowers, and vegetables; good references.—R. PELLETT, 8, Tweed Road, Brockham, Surrey.

GARDENER (Head Working); age 33; married.—A Gentleman wishes to RECOMMEND G. STRICKLAND, who has been with him two and a half years as general foreman; eighteen years' experience in all branches of gardening, two years previous as foreman.—G. STRICKLAND, Elston, Newark-on-Trent.

GARDENER (Head), where one or two are kept, or Single-handed; age 31; single; life experience in all branches; abstainer; good references.—GARDENER, 9, Myrtle Terrace, Crawley Road, Horsham, Sussex.

GARDENER (Head Working or good Single handed); thorough knowlege of stove and greenhouse, kitchen garden, vines, peaches, melons, tomatos; age 38; married; small family, youngest seven; four and a half years' character from last place.—W. DAVIS, Chingford Road, Walthamstow, Essex.

GARDENER (Head Working), age 30; thoroughly practical in all branches; six years' excellent character as General Foreman here, two and five previous.—ALFRED PARKER, Gilston Gardens, Harlow, Essex.

GARDENER (Head-Working); thoroughly experienced in all branches of the profession; married, no family; wife would take charge or help in house; good references.—R., 2, Mabel Cottages, Anyards Road, Cobham, Surrey.

GARDENER (Head-Working, or good Single-Handed); age 24; nine years' practical experience; Inside and Out; abstainer; well recommended; good character.—F. HAWKINS, Littlebourne, Dover, Kent.

GARDENER (Head-Working); thorough knowledge of outdoor fruit, kitchen, flower garden, stove, greenhouse, vines, melons, &c.; married; good references; total abstainer; excellent character; nearly twenty years' experience.—A. HARTLEY, Portchester, Hants.

GARDENER (Single-Handed, or where help is given); eight years' practical experience in the cultivation of fruit, flowers, vegetables; pony not objected to; age 22; height 5 ft. 8 in.; wages not under 22s.—W. MARTINGELL, Grange Wood Cott, South Norwood.

GARDENER (Single-handed or Second), where three or four are kept; nine years' experience; age 25; first-class references.—B., Fortismere Cottage, Fortis Green Road, East Finchley, N.

GARDENER (good Single-handed), or where help is given; good references; thoroughly understands flowers, fruit and vegetables; age 25; married.—H. HIGGS, Updown Hill, Windlesham, Surrey.

GARDENER (Second, or Single-Handed); ten years' experience; Inside and Out; age 23; good testimonials.—G. G., 39, Evelyn Street, Deptford, S.E.

GARDENER.—SITUATION WANTED by married man, aged 30, under Head Gardener; experienced in glass, vines, greenhouse plants, kitchen garden; four years' good character from present place; leaving through death.—W. H. PIPER, near the School, Combe Martin, N. Devon.

GARDENER (Under) age 23, WANTS SITUATION; well up in flower, kitchen, and fruit garden; eighteen months' good character from last place.—OTTAWAY, 2, Victoria Cottages, Cosham, Hants. No circulars.

JOURNEYMAN (Inside).—Age 21; seven years' experience in plants and fruit in good gardens; excellent references.—Address F. LUCAS, Elsham House, Grantham, Lincolnshire.

MAN, young, SEEKS SITUATION on Gentleman's Estate, or Caretaker; good plumber, gas and hot water fitter; handy at other branches; long references PLUMBER, 18, Beversbrook Road, Upper Holloway, London, N.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SITUATION WANTED as Head Working Gardener, where two or three are kept; or good single handed with help; age 35; married; one girl, age twelve; twenty years' good practical experience, inside and out; excellent references.—D., Friars' Lodge, Matfield, Paddockwood, Kent.

SITUATION WANTED as good Single-handed Gardener; thorough experience in vines, melons, cucumbers, tomatos, and kitchen garden; excellent character from past situations; single.—Apply J. WOODS, Covers Road, Claygate, Surrey.

TO GARDENERS and FRUIT GROWERS.—WANTED, LODGING with Board for a few weeks for a young man recovering from illness, with opportunity of working in garden or fruit plantation, within fifty miles of London preferred.—Address, by letter only, wihh terms, to "GARDENER," care of Messrs. Charles Barker and Sons, 8, Birchin Lane, London, E.C.

TO NURSERYMEN.—Advertiser, age 19, SEEKS RE-ENGAGEMENT, Inside or Out; state wages.—A. M., 20, Cambridge Avenue, Kilburn, N.W.

UNDER GARDENER, Inside and Out; life experience; good character from present employer; age 22; single; state wages.—E. STRACEY, Shrubs Hill Sunningdale, Berks.

YOUNG MAN, age 21, SEEKS SITUATION as under; inside, or inside and out; good references.—R. TAYLOR, Home Farm, Chalgrove, near Wallingford.

YOUNG MAN, single, strong and willing, SEEKS SITUATION under good man, either in large or smaller place; leaving through no fault; Churchman.—H. C., Monkton, Taunton, Somerset.

Situations Vacant.

HANDY-MAN and Wife WANTED, without children; care of house, garden, poultry; man handy enough to do all sorts of odd work; attached are observatory, lathe, carpenter's shop, electric and photo rooms; experience in all unnecessary, but must be handy enough to help in some and learn.—FRANKLIN, Machrihanish, Campbeltown.

WANTED, an IMPROVER for general garden work; must have some previous knowledge; wages 14s. per week.—Apply, with testimonial, to H. BLAKE, Gardener to the Earl of Onslow, The Gardens, Temple Court, Guildford.

IMPORTANT NOTICE.

AN EMPLOYMENT REGISTRY DEPARTMENT IS CONDUCTED IN CONNEXION WITH THE "GARDENERS' MAGAZINE," AND THE CHARGE FOR AN ADVERTISEMENT ***INCLUDES A FREE ENTRY ON THE REGISTER FOR ONE MONTH.*** IF NOT SUITED AT THE END OF THAT TIME, AND IT IS DESIRED THAT A NAME SHOULD REMAIN, IT WILL BE CONTINUED FOR A FURTHER PERIOD UPON RECEIPT OF A REQUEST. IMMEDIATE NOTICE MUST BE GIVEN WHEN AN ENGAGEMENT IS SECURED.

A List of Gardeners on the Register will be supplied upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

ROYAL EXOTIC NURSERY,
CHELSEA, LONDON, S.W.

ESTABLISHED 1832.
NO CONNECTION WITH ANY OTHER FIRM OF A SIMILAR NAME.

ANT. ROOZEN & SON'S
GUINEA PACKAGES
(Delivered Entirely Free in London)
OF
CHOICE HARDY BULBS.

COLLECTION "F" FOR SPRING GARDENING,
Contains **1,034** Bulbs.

50 Hyacinths, distinct colours.
50 Tulips, single early.
50 Tulips, double.
25 Tulips, single late.
24 Tulips, Duc Van Thol, scarlet.
20 Narcissus polyanthus.
30 Narcissus incomparable.
24 Narcissus poeticus.
24 Anemones, double.
50 Anemones, single.
300 Crocus, in 4 distinct colours.
100 French Ranunculus.
36 Gladiolus nanus.
50 Snowdrops, single.
75 Spanish Iris.
24 Scilla sibirica
4 Lilium umbellatum.
50 Eranthis hyemalis (Winter Aconite).
24 Ixias, best mixed.
24 Triteleia uniflora.

COLLECTION "C" FOR INDOOR.
Contains **342** Choice Bulbs for 72 Pots and Glasses.

HALF OF EITHER OF THE ABOVE FOR **11s.**

The above Packages may be had from our Agents,

Messrs. MERTENS and CO.,
3, CROSS LANE, LONDON, E.C.

On receipt of Cheque or Post Office Order.

Our Descriptive BULB CATALOGUE (100 pages in English) containing FULL CULTURAL DIRECTIONS, will be sent post free on application to our Agents, as above, or ourselves direct at

OVERVEEN, NEAR HAARLEM, HOLLAND.

WEBBS' EARLY BULBS.

THE FINEST BULBS OF THE SEASON.

ROMAN HYACINTHS.
EARLY WHITE, extra large bulbs . **2s. 6d.** per doz.

THE GARDENERS' MAGAZINE.

SATURDAY, SEPTEMBER 17, 1898.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

LEAVES AND FRONDS.

LEAVES and fronds appear so generally similar in character that we are apt to lose sight of the fundamental differences between them. Leaves, versatile as they are in the production of diverse methods of cutting, or veining, or colouring, twisting or twirling, or bunching, or branching, are but auxiliaries in the one great function of the plant, that of reproduction by seed. To arrive at this, evolution has managed as a rule utterly to transform the leaves proper, under favourable circumstances, into the altogether dissimilar, and usually much more beautiful reproductive apparatus which we know as flowers. So thorough, indeed, is the metamorphosis, that it is mainly the scientific botanist who grasps the real facts, though here and there, as in the callas, we see the relationship of leaf and flower plants clear enough, and floral abnormalities like green roses, and the brilliantly coloured bracts of poinsettias display the same thing in different fashions. In the fern, however, we seek in vain for similar transformation, and although we get here and there apparent attempts at it, such as in the royal or so-called flowering fern, the aneimias, the lunarias, and others, the resemblance disappears on close investigation, since no trace is discernible of the marvellous arrangement of petal, stamens, stigma, pollen and ovary, which go to constitute a flower. All we find in these is a contraction of the frond into a mass or masses of spore capsules, and examining the backs of fronds of other ferns not so differentiated, we find still these spore capsules in heaps, or lines, or dots, or generally spread over the surface according to the specific character of the fructification. Never a flower, and yet if we study the evolution of flowering plants, we shall find far away in a dim and distant past these flowerless ferns must have been their progenitors; and further we are confronted with the fact that ferns having managed to exist ever since that distant period, there must be some efficacious reproductive scheme to keep them going. Here comes in the wonder; we drop one of the millions of spores on a piece of damp clay, and watch it. In a week or two it has developed a tiny emerald green heartlet, like a herring scale, and about the same size. Pick this prothallus up, and put it under a strong lens, and, behold, the flowers of the fern are there; there lies the embryo seed; thither comes the fertilizing brood of antherozoids, and presently the seed generates, up comes a tiny frond, down dips a tiny root, and a fern is born to all intents and purposes in precisely the same fashion as a flower. The leaf, therefore, differs from the frond in one great essential; it bears no reproductive bodies, hence flowering plants proper differ from ferns, since they produce no spores, which form independent flowering plants on a microscopic scale, but bear themselves the incipient seeds which are fertilized in a thousand and one fashions by wind or insect agency. One result of this difference has been an entirely different mode of natural selection; the conspicuous flower once started attracted insects by virtue of its visibility. Hence, increased in size and brilliancy, and varied in type as well, the inconspicuous microscopic fern flower, however, has stood still, and is almost identical in every species and genus, despite the wonderful diversity of size and cutting which has been evolved in other ways.

WATER SUPPLY FOR GARDENS.

THE long-continued dry and excessively hot weather which has been experienced over the greater part of the United Kingdom has greatly emphasised the importance of the water question in relation to the garden, and brought into strong relief the necessity for a serious attempt being made to materially improve the supplies of water in the majority of gardens in country districts. We need not now insist upon the desirability of keeping growing crops of all descriptions well supplied with moisture, the value of overhead washings of fruit trees, or the necessity of frequent waterings of lawns and tennis courts in dry weather, for all these things are well known to those who have had any [illegible] experience. There is no want of appreciation of the value of water as an aid to good culture by those responsible for the management of country gardens; but it appears to be extremely difficult to [illegible] the owners of these establishments that a liberal supply of [illegible] essential to the full development of their resources. Still more [illegible] to persuade them that the supply should be so readily available as to admit of it being being efficiently and economically used. Were it otherwise, we should not so frequently see men engaged in drawing the water from great depths by means of force pumps, and using it without the slightest exposure to atmospheric influences. On the contrary, we should find owners taking full advantage of natural forces, or, in other words, they would provide the machinery by which wind in lieu of highly-paid labour, would raise ample supplies at an infinitesimal cost. We have on several occasions directed attention to the great value of wind engines as the motive power for force pumps, and we have shown how Messrs. Bunyard and Co. obtain abundant supplies for their Allington nurseries by means of a wind engine erected on the higher ground. We have also referred to the fact that upon Lord Spencer's estate in Northamptonshire two villages are regularly supplied with water by the agency of wind engines. The subject is, in fact, one to which we have devoted a considerable share of attention, and we now refer to it for the purpose of showing the enormous quantity of water a fairly powerful engine will raise in the course of twelve months. We have before us the carefully-kept record of the year's work of a sixteen-foot geared wind engine, which has its axis eighty-two feet above the ground. The engine is of steel, and its work is done through one or more of four pumps (*a*) a reciprocating pump with fourteen-inch piston; (*b*) a bucket pump with a normal capacity of one hundred and twenty gallons per minute; and (*c* and *d*) two centrifugal pumps, which were not found satisfactory with wind as the motive power. The second pump required the least power to work it, and was used with light winds. With a stronger wind the reciprocating pump was used, and with a very strong wind the two pumps were run together. The water was pumped into a self-emptying and self-registering tank, and the total quantity raised, neglecting decimals, was 2,345,053 cubic feet, or sufficient to cover seventy-nine acres to a depth of twelve inches, and as one inch of water is equivalent to one hundred tons per acre, there will be no difficulty in ascertaining the weight of the water raised. The variation in the velocity of the wind renders it necessary to provide storage for the water pumped to ensure a supply for irrigation when needed; but apart from the cost of the tanks this is an advantage, for with an open reservoir the water becomes aerated, and during the summer months warmed also. The tank should, of course, be placed at a sufficient height for the water to flow over the whole of the garden, and with sufficient force to be used for washing wall and other fruit trees. To show how the variation in the velocity of the wind would affect the supply for irrigation, the year's work of the mill was divided into periods of ten days each, and the smallest quantity raised in any one period was sufficient to cover nearly ten acres to a depth of one inch. It will therefore be seen that while the wind engine works only when the wind is sufficiently strong, it can be depended upon, with storage accommodation, to produce large supplies in proportion to its power, and thus materially reduce the cost of watering.

IMPORTS OF FRUIT AND VEGETABLES.

THE returns of the Board of Trade for August are more satisfactory than were those for the three preceding months, for there are increases in both the imports and exports, and evidence of an augmentation of our trade with the United States. The imports show an increase of £3,845,142, equal to 11·5 per cent., and in the exports of British and Ireland produce and manufactures, there is an increase of £1,412,019, equal to 7·5 per cent. With the large increase in the imports of general commodities it is interesting to observe that there is an exact balance between the increases and decreases of the imports of fruit and vegetables. Apples were received in smaller quantities than for several years past, the imports amounting to 116,860 bushels, of the value of £34,083, a decrease in quantity of 65,887, and in value of £16,144. During the eight months ending August 31 we imported 1,062,427 bushels, of the value of £385,415, against 2,300,617 bushels, of the value of £634,688, in the same period of 1897. Cherries, on the other hand, evince an increase in quantity of 28,958 bushels, and in value of £11,175, the imports amounting to 34,535 bushels, of the value of £13,001. For the eight months there is an increase of nearly 100,000 bushels as compared with 1897, and of almost double the quantity as compared with 1896. The increase in the imports of grapes is also large the quantities received having been 236,641 bushels, valued at £98,780 Notwithstanding an increase of 126,988 bushels in August, the imports of grapes for the eight months do not differ materially from those of similar periods in the two preceding years. There was a considerable shrinkage in the imports of lemons, oranges, and nuts used as food, and a large decrease in the receipts of pears. In August, 1897, we imported 450,616 bushels of pears, of the value of £154,638; but last month the imports were 128,854 bushels only, of the value of £56,705, a difference in quantity of 321,762 bushels, and in value of £97,933. Plums, on the other hand, show an increase, the quantities imported having been 491,633 bushels, against 471,073 bushels in the corresponding month of last year. The values for the respective quantities are £246,556 and £206,714. Unenumerated fruits continue to advance, and the value of the imports of these in August is given as £117,026. Potatos again show an increase both for August and the eight months. The monthly imports were 90,939 cwt., and of this quantity France sent us 84,718, and the total for the the eight months is 6,363,861 cwt., of the value of £1,843,345, the latter being as near as may be double the value of the foreign supplies in the same period of 1897. Unenumerated vegetables continue to increase in importance, as indicated by the fact that their value for the month is returned at £207,716, and for the eight months as £1,161,161. This is a goodly sum to pay for supplies of miscellaneous vegetables, and it should be worth the while of cultivators for market to enquire how far it might be possible to meet the demand with home-grown produce.

The British Association Meeting was brought to a close on Wednesday, and the general opinion is that the gathering was one of the best that has yet taken place under the auspices of the body. The papers have throughout been of exceptional interest, and the address by Professor F. O. Bower, F.R.S., at the opening meeting of the botanical section, is very properly considered one of the most important contributions that has been made to the literature of botany for some years past. The 1899 meeting will be held at Dover, and of this Professor Michael Foster, F.R.S., is the president-elect, and in the following year Bradford will be the place of meeting.

Diffusion and Absorption of Odours.—The laws of the production and propagation of smells have hitherto received but little attention from physicists, hence the address by Professor Ayrton, F.R.S., at Bristol the other day, in which they were fully discussed, was of special interest. Referring to the diffusion of the odours of flowers and some other natural products, Professor Ayrton said that when liquids like ammoniated lavender, smelling salts, solution of musk, and amyl acetate were employed, and various devices were used for introducing the liquid, and preventing its splashing when it boiled on exhausting the air, it was found that the time that it was necessary to leave the two limbs of a U tube connected for a smell to be just observable was reduced from a few minutes or seconds when the tube was filled with air to less than half a second for a good vacuum; with solid camphor it was reduced from twenty minutes to one second, and when moist rose leaves were used, from fifty minutes to two seconds. But with solid particles of musk the time was not reduced below twenty minutes by taking away the air, while with dried lavender flowers and dried woodruff leaves no smell could be detected after the two limbs had been connected for many hours, and a good vacuum maintained. These experiments are, of course, somewhat complicated by variations in the amount of odourous surface exposed, but they seem to indicate that with these particular dried substances either the rate of evolution of the scent, or its rate of propagation, or both, are very slow even in a good vacuum. Some tests on the power of different substances to absorb various scents from the air have also been carried out. Lard, it is well known, is used to absorb the perfume from flowers in the commercial manufacture of scents, perhaps because it has little odour of its own, and because the scent can be easily distilled from it. But when lard, wool, linen, blotting-paper, silk, &c., were shut up for some hours in a box at equal distances from jasmine flowers, dried woodruff leaves, or from a solution of ammonia, it was found that it is not the lard, but the blotting-paper, that smells most strongly when the articles are removed from the box. On the other hand, when solid natural musk is employed, it is the wool that alone acquires much smell, even after the box has been shut up for days. Another noteworthy fact is the comparatively rapid rate at which grains of natural musk are found to lose their fragrance when exposed to the air. The popular statement, therefore, that a grain of musk will scent a room for years supplies but another example of the contrast between text-book information and laboratory experience.

Richmond Scenery.—The question of the purchase of Glover's Island, Richmond, by the Corporation has been disposed of, that body, as might have been expected, declining to make the purchase. At a meeting of the Richmond Town Council on Tuesday, the Mayor presiding, the Amenities Committee reported, with regard to the option of the purchase for £4,000 of the island, in the Thames beneath Richmond Hill, which the Mayor, acting as agent for the vendor, had secured for the town, the committee reported that only £50 had as yet been secured in public subscriptions towards the scheme. In view of the fact that the assessment of the island was at the yearly value of £18 only, that it had been purchased twenty-four years ago for £72, that it was extremely unlikely to be bought for the purposes of an advertisement station or for any of the other objectionable purposes mentioned in the advertisement, they recommended the council not to accept the offer. The committee further declared that they felt that public opinion would condemn in the strongest manner any proposal to injure the world-renowned view of which Glover's Island formed a part. The recommendation of the committee was unanimously accepted.

Town Trees in America.—The importance of trees in streets is evidently fully recognised in some of the cities in the United States, and ample provisions are made for their planting and maintenance. The Board of Park Commissioners of Minneapolis has authority under the Park Act to plant trees on any street and assess the cost of the same on abutting property. This authority, as a rule, is not exercised except when petitioned to do so by a majority of the residents of the street. The cost of planting and caring for the trees for three years is about twenty shillings, but this sum is undoubtedly under, rather than over, the actual expense. The city being underlaid with gravel, it is necessary to remove at least five yards of the material, which is replaced with the same quantity of rich loam in which the tree is planted. It would be a paying investment for the owner of the property if double the amount of loam were furnished and charged for. Each tree is protected by a guard, which serves the double purpose of protecting the bark from the rays of the sun and from the teeth of the horses. Many of the streets have been improved with uniform rows of trees, and the number of petitions for the improving thoroughfares increases each year. Some of the older trees which were planted before the care of this work was assumed by the Board of Park Commissioners show the usual haphazard way in which planting was done when each owner of a forty-foot lot exercised his own will. Some planted four or five trees, each of a different variety, and never cared for them. Others did not plant any, and a few set and cared for trees which have grown to be fine specimens of their kind. Up to the time the park commission became the custodian of the street trees, more had been planted and had died, either through ignorance in planting, or through neglect, than were then growing. The loss since that time has been less than two per cent. A commission having charge of the trees in the city of Washington has absolute control and care of them. It is decided to use a certain variety on a street, that variety is planted and there is no appeal from its decision. As a result, there is no city having so many unbroken rows of healthy trees. Other cities in America have undertaken the control of street ornamentation with great success, and it is to be hoped that all will follow their example.

Messrs. Linden's Nurseries.—With reference to the notice of Messrs. Linden's establishments at Brussels, it will be of interest to mention that in addition to the large establishments, L'Horticulture Internationale, in the fashionable Quartier Leopold, and M.M. Lucien Linden et Cie. at Moortebeek, in the western suburbs of the city, M. Lucien Linden is forming a still more important nursery in the rising eastern suburb of Brussels. Visitors to the International Exhibition held in Brussels last year may remember the splendid new avenue commencing at the back of same, and extending for a length of over ten miles, connecting the city with the magnificent Royal Park of Teroueren. A new avenue, "Jean Linden," is being laid out to the left, at the back of the exhibition, dedicated in memory of the late Jean Linden, and it is here that M. Lucien Linden is creating the large establishment for the culture of commercial plants on an extensive scale. The space occupied by the nursery when completed will be over three hectares (one hectare = 2·471143 acres).

Wood-Destroying Fungi were discussed in the botanical section of the British Association, the discussion being opened by Professor Marshall Ward with a paper on "Penicillium as a Wood-Destroying Fungus," in the course of which he said that spores from pure cultures of penicillium sown on sterilized blocks of spruce-wood, cut in March, were found to grow freely and develop large crops of spores on normal conidiophores. Sections of the infected wood showed that the hyphæ of the mould entered the starch-bearing cells of the medullary rays of the sap wood, and consumed the whole of the starch. The resin was untouched. In culture three months old the hyphæ were to be seen deep in the substance of the wood passing from tracheide to tracheide *via* the bordered pits. Control sections, not infected and kept side by side with the above, contained abundance of starch, and no trace of hyphæ could be detected in them. The observation appeared of interest in several connections. Penicillium is one of the commonest moulds, and undoubtedly played a part in the reduction of plant débris to its constituents; how far it could itself initiate the destruction of true wood, or how far it merely followed on the ravages of other fungi, bacteria, &c., was unknown. There were strong grounds for believing that it destroyed the oak of casks, &c., but since these were impregnated with food materials that was not very surprising. It appeared as if penicillium might be a much more active organism in initiating and carrying on the destruction of wood than had hitherto been supposed, and that it was not merely a hanger-on or follower of more powerful wood-destroying fungi.

Wasp and Bee Stings.—As several persons have died this season from the effect of being stung in the mouth by wasps, when eating fruit, the importance of an effective remedy easily applied, cannot be over-estimated. In a letter to *Nature*, Sir J. F. D. Donnelly states that he has found cocaine an efficient remedy for wasp or bee stings. It is said to act apparently not only as a temporary local anæsthetic, but seems also to have the power of destroying the poison of the sting. Sir J. F. D. Donnelly happened to have some one-sixth grain cocaine tabloids for hypodermic injection when a lady was badly stung by a wasp a year or two ago. Such stings have a great effect on her, not only producing a very large and painful swelling, but making her feel more or less unwell for two or three days. One tabloid dissolved in a few drops of water, and applied with the finger at once, almost removed the pain; a second, applied an hour or two after, completed the cure. A few days later the cocaine was found equally effective in the case of a young girl who had been severely stung. Since then he has kept a small bottle of a strong solution of cocaine ready for use, and it has always proved effective. It should, of course, be applied as soon as possible, but a few days ago it was found to give great relief seven or eight hours after the sting. It is of some importance to know whether it would be safe, in case a person were stung on the tongue and no doctor could be secured at once, to give a hypodermic injection in the tongue of one-sixth grain cocaine, or whether it would be better to apply the tabloid or a solution externally to the place. Possibly some of our medical friends may be able to advise us upon this point.

Preservation of Open Spaces.—Dr. Robert Hunter pays a well deserved tribute to the services rendered by the late Sir Henry Peek in launching the movement for the preservation of open spaces. That movement, he writes, may be said to have first assumed a definite direction at Wimbledon in connexion with the proposal of Lord Spencer to convert the common into a park. Sir Henry Peek, as the principal resident and the owner of Wimbledon House, put himself at the head of the committee formed for the protection of the common and the public, and, it is unnecessary to say, contributed largely to the funds required to finance the Parliamentary proceedings and the litigation which became inevitable. When Lord Spencer subsequently offered to transfer his rights in the common to a body of conservators, representing both local and general interests, Sir Henry Peek became chairman of that body, and his hospitable house was for many years the place of meeting of the board. Sir Henry's interest, however, extended beyond the common at his doors. He stimulated a movement, attended with like happy results, for the preservation of Wandsworth Common. He was one of the founders of the Commons Preservation Society, and in days when both legal and general opinion was still wavering he offered prizes for essays on the best means of preserving open spaces, and subsequently published six essays on the subject, which undoubtedly played their part in emphasizing and guiding public feeling. He was a warm sympathizer in the early efforts to preserve Epping Forest, and threw the weight of his position in the City on the side of the Corporation of London when they espoused the cause of the public. Some years later Burnham Beeches were offered for sale, together with a considerable acreage of enclosed plantation, and inquiry showed that this most picturesque common and its magnificent pollards ran great danger at the hands of the speculative builder. The Corporation were able and willing to buy the Beeches, but they had no power to purchase the plantations. On being informed of the difficulty Sir Henry Peek at once agreed to acquire the whole property and to resell the open woods and common to the Corporation at a proportionate price. He thus made the preservation of the Beeches possible.

High Temperature in September.—The high temperature which prevailed during the first half of the current month will not be quickly forgotten. The 8th inst. was not only the hottest day we have had this year, or as a matter of fact since August, 1893, but the hottest September day experienced for just thirty years past. At eight o'clock in the morning the thermometer in the shade in London stood at 69 degrees, and by 10 a.m. it had risen to 83 degrees. while at about midday it reached a maximum of 92 degrees, the reading being no fewer than 25 degrees above the average for the month of September. At Kew the reading was somewhat higher. To find an equally hot September day we must go back to the year 1868, when the thermometer at Greenwich rose on the 7th of the month to 92 degrees. In no other September of the past fifty-seven years did the thermometer get within 4 degrees of the reading on the 8th, or within 4 degrees of the 1868 value, the nearest approach to it being Wednesday, 7th inst., and on the 4th of the month in 1880, when it reached 87 degrees. In only seven of the past fifty-eight Septembers has the thermometer in London even touched 85 degrees, and in no fewer than forty-three years out of the fifty-eight it failed to reach 80 degrees.

Fruit Growing in Suburban Gardens is the subject for discussion at the meeting of the Royal Horticultural Society on Tuesday next. The discussion will be opened by Mr. W. Roupell, who has devoted much attention to this aspect of fruit culture.

The Pomological Congress to be held at Mans under the auspices of the French Pomological Society from October 6 to October 9 will be chiefly devoted to questions relating to the production of cider and perry. The programme is as follows: (1) Diseases of the apples and pears; selection of varieties for cider; (2) varieties that have been successfully introduced into the Sarthe district; (3) general description of varieties of apples and pears grown in Sarthe for cider and perry; (4) new apples and pears for vintage purposes; (5) foreign varieties recommended for cider and perry; (6) culture of apples in arable and grass orchards; (7) raising new varieties of apples; (8) the use of manures in apple culture; (9) the preparation of fruit for cider and perry; (10) the sale and exportation of cider and perry. The congress should be of interest to those engaged in the cider industry.

Tree Preservation.—Notwithstanding our much vaunted civilisation, it is evident that some members of the English community might with advantage take lessons from at least one of the primitive races of the world. M. Louis de Rougemont, whose account of his enforced exile of some twenty-eight years among the cannibal blacks in the Cambridge Gulf region of Australia has created much interest, states that the tribes with which he was associated had a great veneration for trees. Stone axes are used for felling trees, but the natives only fell trees with the greatest reluctance, and apologies are offered to the trees for taking their lives away. The fuel used is dry dead wood that has fallen from the trees, for no trees are felled for fuel under any circumstance.

Plant Symbiosis.—An interesting case of symbiosis is described by Mr. A. Vaughan Jennings and Mr. H. Hanna in a paper contributed by them to the Royal Dublin Society. In recording their investigations of Corallorhiza innata and its mychorhiza they state that the coralloid rhizome is covered with numerous papillæ upon which tufts of hairs arise. The latter enter into very close relationship with the fungal hyphæ growing in the soil, forming a mychorhiza. Owing to changes taking place in the hairs bundles of hyphæ pass down in the inside of the hairs through the outer layers of cells into the cortex, in the outer layers of which they form a coiled mycelium, and in the deeper layers they undergo a process of degeneration, and are absorbed by the protoplasm of the cells. The evidence indicates that the host plant acts carnivorously towards the hyphæ. The hyphæ constituting the mychorhiza in this case were traced to one of the higher fungi, Clitocybe infundibuliformis.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

It is not often that the sensations of what is euphemistically, and not without humour, styled "the great world" penetrates to the minor sanctuary of horticulture, but there is a striking exception in the astounding and perplexing mystery which is now agitating law courts and public. I read some scraps of the highly-flavoured reports of the Druce case with the casual and perfunctory interest which is all I can muster, as a rule, when the subject is that of the average novel, until there cropped up the name of Ormson, and then I began to arouse my sluggish faculties. Ormson is not an everyday name; on the contrary, it is a distinctly uncommon one. Could this be the same Ormson that I knew many years ago? The reference to him as a horticultural builder settled the matter. It was the same, and straightway I plunged into the mystery.

I have been trying to think how long it is since I saw Ormson. It must be nearly twenty years. He was ill at the time, and complained, if my memory serves me, of severe rheumatism. Anyway, he was troubled with a painful complaint, and I believe he afterwards died of it. Many readers of this paragraph will remember his place as well as I do. It was situated on the left-hand side of King's Road, Chelsea, a quarter of a mile past Veitch's Nursery, and close to the bridge over the railway. He had an excellent business connection, not, perhaps, as large as some, but embracing many of the best families. That, of course, is how it is that he was in the position to make the singular statement concerning the former Duke of Portland, which has recently seen the light in the daily Press. Whether it will have any influence on the fortunes of the great legal duel which seems to be impending remains to be proved. But I for one shall follow the case with a new interest as a result of this curious interposition of a dead hand.

Talking of mysteries, it would appear that we have one of our own on a small scale. It also deals with a burial and resuscitation and with a changing of names. I need not say that I refer to Acalypha Sanderi. I find that there is a good deal of talk about this in gardening circles, and I should be more than human, journalistically speaking, if I did not, as a consequence, lay hold of the subject. Assertion and denial appear to follow swiftly in each other's footsteps, but surely there is very little room for doubt. Those who contend that the plant is an old one give chapter and verse for their assertions, and it would seem that the matter can be simply and speedily resolved by testing their references. As far as the public are concerned, I don't think it likely that much will happen. I believe they will buy the plant whether it is an old one rediscovered or a genuine new one never before brought to or described in this country. The point is an academic rather than a commercial one.

A kind friend in the South of England, who tells me, with every symptom of disgust, that he is sometimes charged by sapient critics with the heinous offence of writing these notes, sends me a cutting from a local paper bearing reference to a show of animals by the gardeners of Canterbury. Not so many years ago I resided near that ancient city, and although the gardeners of the neighbourhood were great with flowers (including annuals), I was not aware that they went in for live stock. Perhaps the printer has been at it again. He made me say "hands" a week or two ago in reference to Mr. Druery, when I wrote "ferns" as plainly as—well, for want of a better simile, I will say as plainly as I ever write anything. I refuse to believe that the Canterbury gardeners exhibited their collection of "animals" in the form of insects on their plants, because they are good cultivators and regular readers (many of them) of the GARDENERS' MAGAZINE.

Mention of this paper reminds me of a wonder which I have sometimes indulged in as to whether our editor resents or appreciates the familiar abbreviation which is employed in alluding to it. With one consent the people refer to this great and glorious journal as "the Mag." I fear it is not elegant. Moreover, the expression opens up harrowing visions of an abbreviation of something else. But I expect he rather likes it for all that, because, as he must assuredly have reflected, when a popular, or nickname is adopted, it is usually a token of intimate friendship, even of affection. And it is just that spirit of personal interest, of brotherly feeling, which we like to foster. Those who get into the way of looking on the paper as a friend, and of referring to it familiarly, are the sort to do it good. You may "Mag.," therefore, as much as you like, ladies and gentlemen all. Better do that than nag, any day.

I am much obliged to "South Bucks" for his "simple" answer. It seems conclusive on the face of it, but unfortunately it is not. There are, of course, wet and dry zones. I suppose he is in one, I in another. I am not alone, though. I have at my elbow a number of records, from which I select that of Mr. W. H. Divers. I do so because it is the only one that gives the averages. The March rainfall is given as 0·10 below the average, the April fall as 0·09 above, and the May fall as 0·35 above. The average of the three months mentioned by "South Bucks" is, therefore, shown by a careful observer to be 0·34 above the general average.

Mr. George Harris's article on Apples in Northumberland may be commended to the attention of people who live in the other thirty-nine counties. I am particularly impressed with his selection of sorts, which comes as near to a model one as any I have seen. I wonder if Mr. Harris has had any experience with Lord Derby, and if so, what the result is. The market people seem to be regarding it with growing favour, and it is a sort which swells out rapidly to a great size. I think the pick of our new sorts here is the one exhibited at the Drill Hall as Rivers's Codlin, but which I hear has been given a new name. If this rumour is correct, I hope some kind friend will tell me what the name is. It is a beautiful apple, and our young trees are pictures.

LUX.

HOMOLOGY OF PLANTS.

By Professor F. O. BOWER, D.Sc., F.R.S.

THE following is the text of the important address delivered by Professor F. O. Bower, D.Sc., F.R.S., president of the Botanical Section of the British Association, at the opening meeting of that section :—

Shortly before we met last year, in the hospitable Dominion of Canada, two biologists, whose work relates to the questions I propose to discuss to-day, passed away. In both cases their services to science had received honourable recognition in this country. Johannes Japetus Smith Steenstrup, who had been for more than thirty years a foreign member of the Royal Society, died June 20, 1897, at the advanced age of eighty-four; Julius von Sachs, also a foreign member of the Royal Society, died May 29, 1897, aged sixty-five.

The former of these, a zoologist, was probably best known in this country for his work on "Alternation of Generations," a translation of which was published by the Ray Society in 1845. The title-page describes the phenomenon as "a peculiar form of fostering the young in the lower classes of animals." Botanists should remember that this term "alternation," which they often use in a sense peculiarly their own, was originally applied to the course of development in certain animals, by Chamisso in 1819. The first general statement of the subject from the zoological side was by Steenstrup in the work already named; even there no mention is made of such phenomena in plants, until the concluding paragraph, where there is an allusion in very general terms to the course of events in the life of seed-bearing plants. But when we remember that it was only in 1848 that Suminski discovered the antheridia and archegonia borne upon the prothallus of a fern, we see plainly that Steenstrup could not have used the term "alternation" in the sense in which it is now generally applied to plants. The interest for us as botanists will therefore be that Steenstrup suggested in his work on alternation in animals how in the life of plants successive phases exist, and that these are comparable to those which he described in many animals.

Work of St. Julius Von Sachs.

The work of Sachs, on the other hand, has influenced every one of us. Some, including myself, have had the great advantage of his direct personal guidance; all must have derived pleasure as well as profit from his writings. I shall not here attempt any general summary of the achievements of this great man, for that has been done efficiently by the scientific Press at large. I shall merely allude to one feature of his work, viz., the style of its presentment to the reader. He was always clear, usually concise. He was, in addition to his power as an investigator, a master with the pencil, as well as with the pen. It was this combination of qualities which made him the great text-book writer of his time. Never perhaps has a volume more fairly reflected the position of a science at the moment of its publication than did that of Sachs. It resembles the work of a snap-shot camera, and, like any instantaneous photograph of life in motion, it has fixed and perpetuated awkward positions. The morphological system of the time was stiff and unpromising; the text-book accurately depicted this, but it did not suggest or anticipate future developments; it did not bear the softened image of a longer exposure; it presents to us the angular attitude of a moment.

The powers of Sachs as a writer found their best scope in his "History of Botany," a work which will always retain its value as a masterly exposition of the results of very wide reading, arranged with a literary skill which is, unfortunately, rare among scientific men. I lay stress upon this power of Sachs as a writer, apart from his record as an investigator, because he was strong where so many of us are weak. The truth is that little effort is made by men of science to use a concise and transparent style; for the most part we write by the aid of such instincts as Nature has given us; few cultivate composition. But it should, I think, be impressed upon the young aspirant that, when he writes, it is one of his first duties to consider his readers' convenience; he must use all endeavours to convey forcibly the result of his inquiry, but to make the least possible demand upon the patience of his readers.

Three Phases of Morphological Study.

It will be in your memory that the address of last year's Sectional President was largely devoted to branches of our science which touch the material and economic interests of man. It was pointed out to us how certain fungal diseases diminish agricultural profits to an extent which may be estimated in millions of pounds yearly. Beneficent microbes were also mentioned, such as those which govern the aroma and maturing of butter and cheese; these and many others, the study of which lies properly within the province of botany, affect not only the health, but, at the most varied points, the prosperity of mankind.

It is unnecessary for me to dwell further upon these points or to urge again the utilitarian argument for the proper support of botany. I propose, on the other hand, to invite your attention to the morphology of plants. This is a department of science pure and simple. The results which it brings have not, and cannot be expected to have, any money value in the markets of the world. The present time is one of unusual bustle and change in morphology, consequent upon the discovery of new facts and the introduction of new methods. The development of the study may be divided into three periods, we ourselves standing upon the threshold of the third. The earliest phase was that of description and delineation of what might be observed of the mature form of plants; this includes the work of the herbalists and of the earlier systematists, who thus furnished the basis for classification. It is true that the mere description was enriched at times by comparisons made, but these often took a capricious form, as is shown by the many curious allusions which still survive in the nomenclature. Erasmus Darwin satirised the imaginative comparisons indulged in by early writers in his "Loves of the Plants"; an instance of this is seen in his lines referring to the legendary organism, half animal, half plant, suggested by the peculiar form of *Dicksonia* (*Cibotium*) *Barometz* —

"Cradled in snow and fann'd by arctic air
Shines, gentle Barometz, thy golden hair.
Rooted in earth each cloven hoof descends,
And round and round her flexile neck she bends;
Crops the grey coral moss, and hoary thyme,
Or laps with rosy tongue the melting rime.
Eyes with mute tenderness her distant dam,
Or seems to bleat, a *Vegetable Lamb.*"

The tendency to comparison thus already perceptible asserted itself strongly in the next phase of our study, to which it gave its character. And now the need arose for observing development; this was initiated by Schleiden, and carried to a triumphant climax by Hofmeister. Passing from the hands of these pre-Darwinian to those of post-Darwinian writers, the comparisons, while remaining virtually the same, received a new significance. Observers now pushed their inquiries into the details of anatomical structure and development, and in many cases attached an importance beyond what is justifiable to minute similarities or differences of cell-cleavage. Thus what might be called "cellular morphology," became a feature of the period. It has, however, been in a measure discredited by the excessive zeal of some of its votaries, who drew large conclusions from slight facts; a salient example of this is furnished by studies concerning segmentation of the ovum. But we must not assume that because it has been pursued indiscreetly, the study of segmentation is effete.

Morphology has lately passed to a third stage—that of experiment—with a view of ascertaining the effect of external agencies in determining form, and the limits of variability under varied circumstances. Development of itself shows only how a part originates; it does not demonstrate what it is, nor what it may become under special conditions. This new and growing phase of experimental morphology, together with comparison from the point of view of descent, now tends to supersede the formal morphology of the second period, which in many minds implied or assumed ideal types or creative plans. It has become a general view that the facts of morphology are but the stereotyped facts of physiology, form being determined by function, but under the check of heredity. This third experimental phase of the study of plant-form, is directed, as it were, to the very setting of the types, before the stereotype plate is cast. We watch Nature's compositor at work, but we also ascertain that the plate itself, after it is cast, is much more plastic than some of us had thought.

These three phases of morphological inquiry have naturally overlapped one another; we recognise, however, that first description, then formal comparison, and now experiment, have been the leading features in morphological investigation during these successive periods.

Homology.

The ideal aimed at in the study of the morphology of plants is to trace their real relationships and mode of origin, on the basis of the widest observation—in short, to reconstruct the evolutionary tree. In order to make comparison possible, or at least manageable, a terminology is necessary, and this not only of the plants themselves, but also of their parts. We may for the moment leave on one side that summing up of morphological opinion represented by the systematic arrangement of plants in a taxonomic system. I propose to-day to discuss not the classification of plants, but the classification of the parts of plants, their grouping according to their *homology*. And here I use a word which is probably explained to every class of elementary students; it is one of those terms a meaning of which is indeed revealed to the babes of the science, while those who teach are not at one as to its definition. We need not enter now into the various opinions which have been held on this point, nor need we make any antiquarian research into the introduction or early use of the word *homology;* it will suffice to state that it was already firmly established in the science before views as to descent gave it any intelligible meaning. We speak of the homologies recognised by Hofmeister, but it should be remembered that their great discoverer did not put an evolutionary interpretation upon them. Sachs points out in his history how "the theory of descent had only to accept what [illegible] morphology had already brought to view" Nevertheless, much remained ingrained in the very texture of the science which was incompatible with evolutionary thought. This was so even in the text-book of Sachs itself. The categories of root, stem, leaf, and hair are there laid down, and the parts classed under these several heads were held to be [illegible]. In their definition all those characters which refer to function were put aside, the definitions relating to origin and relative position; the reproductive organs were grouped with the rest, with the result that [illegible] parts were described as bearing a varying morphological value. But the purely formal morphology is now dead; it long survived a mere passive belief in evolutionary views, but their active practice has strangled it. The first step towards emancipation was the recognition of [illegible] parts *sui generis.* Eichler, agreeing with Braun and Strasburger, [illegible] that [illegible] it "highly probable according to the theory of descent," that [illegible] structure as the ovule has universally the same morphological [illegible]. It remained for Goebel to make the general statement that [illegible] stand in a category by themselves, and are probably not the [illegible] modification of any vegetative part. It was in this way that the [illegible] genetic factor was first asserted as bearing on a question of [illegible] in the morphology of plants. Adherents of descent no longer [illegible] accepted the direct results of investigation; they began actively to [illegible] and control the interpretation of them; but this position was not attained till more than twenty years after the publication of Darwin's "Origin of Species." Since then, however, views as to descent have [illegible] in the province of morphology [illegible] creasingly important place in the province of morphology [illegible] sent moment a far reaching comparison of allied forms, [illegible] experiment, is the most potent instrument in the hands of the morphologist.

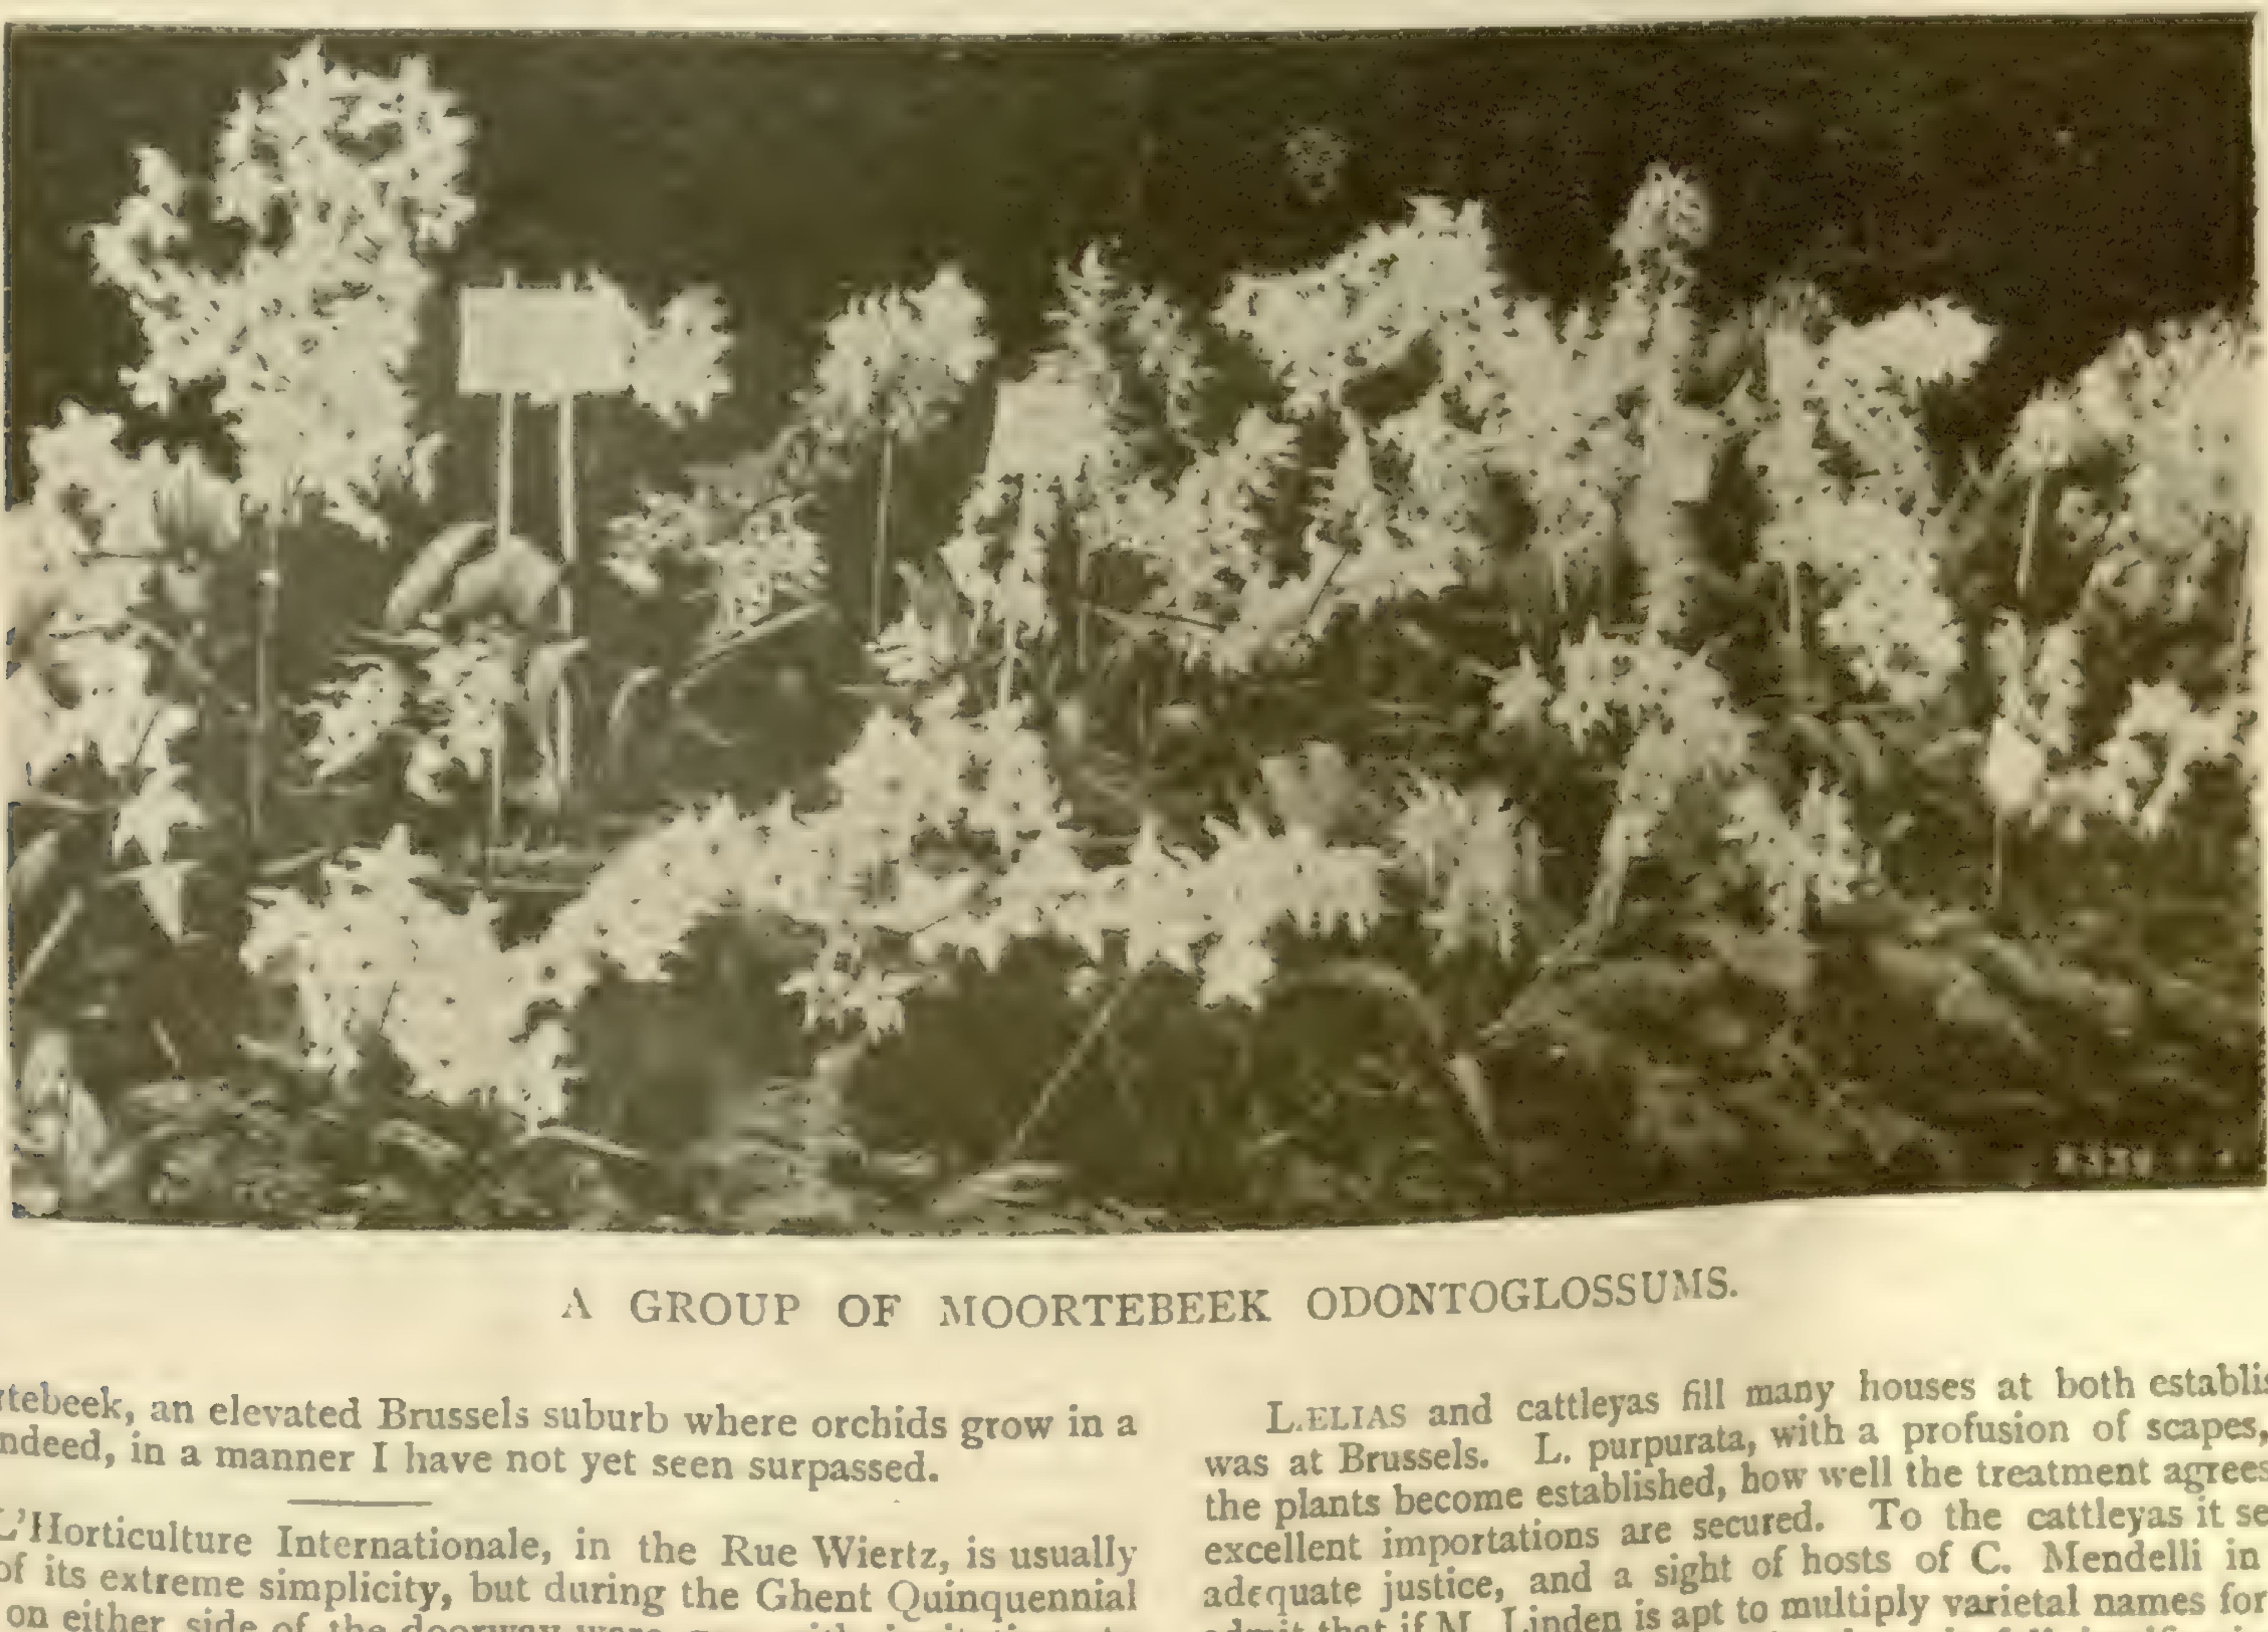
(To be continued.)

MEMORIES OF BRUSSELS.

THERE is something in the nature of most of us that is usually more or less opposed to the existing state of things, and, if we do not always so act, we often think in opposition to what we endure. Are we hot; then we desire to be cool. Are we cool; then we desire to be warm. Are we in brilliant sunshine; then we wish for leafy shade and cool breezes. And so it happens that during the past few brilliant and hot days, with a large part of our metropolis perspiring, one longs for the cool, shady, and well-watered boulevards of Brussels, with their grand system of electric trams as opposed to our underground railways. Possibly it is too hot to be pleasant, even in Brussels just now, but when last there the trees had on their new mantle of green, for it was springtime.

MONS. LUCIAN LINDEN.

AT any season of the year there is much in and around Brussels of more than passing interest to the British horticulturist. The King's garden at Laeken is well worth a visit; it is not far out, and one can readily see the famous Winter Garden from the top of the eminence that Brussels has crowned with a most wonderful, useful, and beautiful building—the Palais de Justice. The neighbouring nurseries are well managed, and the plants are splendidly grown, whether it be the everlasting palms, or dracænas, bromeliads, cyclamen, &c. Then the boulevards of Brussels, with their double and treble avenues, and abundant seats for pedestrians, and the several small but well-kept parks, all form items of interest that one endeavours to cram into a brief visit. Of course, no horticulturist would go to Brussels without a visit to L'Horticulture International, an establishment that has gained a world-wide reputation for cleanliness, high culture, splendid introductions, and its able management at the hands of the late M. Jean Linden, and now of his eminent son, M. Lucian Linden. Now the Messrs. Linden and Co. have an additional attraction for visitors in the shape of a supplemental establishment at Moortebeek, an elevated Brussels suburb where orchids grow in a wonderful manner; indeed, in a manner I have not yet seen surpassed.



A GROUP OF MOORTEBEEK ODONTOGLOSSUMS.

THE entrance to L'Horticulture Internationale, in the Rue Wiertz, is usually noticeable by reason of its extreme simplicity, but during the Ghent Quinquennial Exhibition, the walls on either side of the doorway were gay with invitations to come and see the fine exhibition of plants and orchids. If the entrance somewhat disappoints a visitor, he soon recovers upon entering, for almost immediately he is in a spacious winter garden, where handsome and graceful palms and tree ferns, aroids in variety, especially anthuriums, dracænas, and other ornamental foliage plants are grouped in a most natural and artistic manner, many of the subjects being planted out. The whole of this foliage display is brightened by whatever flowers are in season, and with a few bold orchids. One point that is quickly forced upon one's attention is the wonderful cleanliness that prevails everywhere. How often the houses are painted I do not know, but they always are in first-rate condition, and in this winter garden and the large Central Gallery, from which the series of plant houses run left and right, the paths of dull greyish spar or granite, finely broken, are neat, clean and level. The large Central Gallery also contains an abundance of fine specimen palms, notably some splendid Phœnix and Kentias at the time of my visit, aroids, choice tree ferns, &c., many in large tubs, and others planted out so as to form beds or avenues, among and under which the pathway winds. One could more easily imagine oneself in the garden of a wealthy noble rather than in a commercial horticultural establishment.

AT no season of the year can one visit the establishment at Rue Wiertz without having plenty to be interested in. As orchids are the leading class of plants cultivated, the best time of the year for a visit is spring and early summer—that is, about Temple Show time. The quantities of orchids grown surprises most folk, while the superb growth, cleanliness, and robust spikes provide the roving horticulturist with food for reflection. Not far from Ghent you may find odontoglossums growing as freely as rhubarb, and flowering amazingly, but pots and stages are green with the slime that accumulates when pond water is largely used. In the Messrs. Linden's odontoglossum houses, however, all is as clean as possible, and if growth is not rampant it is robust, and produces grand spikes and flowers. Very wonderful have been the choice forms of Odontoglossum crispum that have first flowered in Europe at Brussels; indeed, the importations of L'Horticulture Internationale have become widely known by reason of the beautifully spotted, highly coloured, and rounded forms they have produced. It is scarcely necessary to remind readers of such gems as O. crispum Luciani, O. c. Lindeni, O. c. augustum, O. c. Kegeljani, O. c. meleagris, Miss Anna Guders, of which an illustration is given herewith, and others, that have gained the highest awards in our own and other countries.

HAVING likened the Brussels establishment to a dining-room, one can only say that Moortebeek is like a drawing-room, for cleanliness is absolute, all the appointments and fittings first rate, while the odontoglossums and miltonias in April and May are almost too wonderful for words. M. Lucian Linden spreads his hands and shakes his head when you ask what fertiliser he uses to produce such wonderful results, and assures us that situation, good water, and the usual careful management are all that is necessary; he agrees, however, that the situation of the Moortebeek Nursery is a great factor in the success that has attended it. Not only does O. crispum do superlatively well here, but O. triumphans, O. Adrianæ—the fine hybrid between O. crispum and O. Hannewellianum—O. luteo-purpureum, O. Ruckerianum, O. Wilckeanum, O. Halli and its varieties, O. cirrhosum, O. Pescatorei, and, in fact, all that are worth growing, possess a vigour that is startling, produce big spikes and flowers, that in the great majority of cases a fancier would go into raptures over. Miltonia vexillaria at Moortebeek was a wonder unto many a Britisher; the collection was as even as a well-kept bed of leeks, with growths and leafage almost as stout, and without any trace of spot, yellowness, thrip-marks, or other evil; the spikes, too, were splendid, and the flowers grand in size, substance, and colour. Some of the choicest forms were seen at Westminster soon after my visit, and there they were greatly admired. Some of the Moortebeek odontoglossums—and there were nearly fifty-five thousand plants in various stages of establishment in April last—were shown at the Temple Gardens in May, together with a magnificent lot of Cypripedium Lawrenceanum, that were all superbums, giganteums, or splendidissimums, so fine were they in size and colour. A few of these choicest forms were photographed for the GARDENERS' MAGAZINE, and the reproduction gives some idea of the immense spikes of O. Pescatorei, O. crispum, O. Adrianæ, O excellens, and other species and natural hybrids produced by this celebrated Belgian firm.

LÆLIAS and cattleyas fill many houses at both establishments, but the bulk was at Brussels. L. purpurata, with a profusion of scapes, showed how quickly the plants become established, how well the treatment agrees with them, and what excellent importations are secured. To the cattleyas it seems impossible to do adequate justice, and a sight of hosts of C. Mendelli in flower compels us to admit that if M. Linden is apt to multiply varietal names for this and other species such as C. Trianæ and C. Mossiæ there is full justification for so doing when confronted with such ample flowers and diverse colouring. Cypripediums are most abundant, and it is almost impossible to name a species or hybrid of any standing that is not here represented. There are several houses full of the montanum group of the ever popular and useful C. insigne, and from these large things are expected. Hybrid cypripediums figure largely, and grow as freely as the species. No space is wanted in the houses, and long lines of pans containing Mexican lælias, sophronitis, masdevallias, barkerias, catasetums, bulbophyllums, oncidiums in great variety, and many others too numerous to mention were seen in various stages of growth. Readers need scarcely to be reminded of the wonderful catasetums the Brussels firm have introduced of late years, plants remarkable for strong growth, stout spikes, immense blooms, and wonderful colouring, producing a series of natural hybrids at once as handsome as unexpected. Vandas and ærides, with other orchids of their class, uphold the character of the establishment for vigour, and one is greeted with a fine odour upon entering a house of V. tricolor and V. suavis.

ORCHIDS do not, however, absorb the whole attention of the establishment, as my opening remarks prove, but one must be conducted to the smaller houses, "La Petite Galerie," to find what is happening behind the scenes. Here, in pretty little houses, are new and rare palms and ferns, choice tropical foliage plants, both raised from seed and imported, and curious plants not yet determined. Then you see some scrubby sticks that may some day provide stock for a new sensation; they are what some enterprising collector has sent home with the hope that they will hand his name down to posterity and create new honours for his firm. How often such hopes and those of his employers fall to the ground is known only to those who toil and wait, but how often success has attended the endeavours of Messrs. Linden, *pere et fils*, is known to all horticulturists, for were all their finds, introductions, and creations taken from us, our stoves, greenhouses, and orchid houses would be vastly poorer than they now are.

THE director of this big concern is Mons. Lucian Linden, a gentleman of wide knowledge, great organising capacity, and genial beyond words. He is the worthy son of a worthy sire, and his keenness of perception is seen in the creation and successful issue of the Moortebeek Nursery, which is being enlarged for the reception of orchids, and still more orchids. M. Linden, whose portrait accompanies these notes, is well known to a large circle of British horticulturists, for he has as hearty a welcome for the casual as for the regular visitor, and generously places his knowledge and experience at the disposal of his visitors. By the way, L'Horticulture Internationale is readily reached from the Brussels Gare du Nord station by electric tram to the Rue Belliard, from whence it is but a few steps.

SERVATOR.

THE DROPPING OF PEACHES.

AMONG the evils attending the cultivation of peaches under glass, that of dropping their fruit during the stoning period is perhaps the worst. In travelling about the country one often meets with fine crops of well-grown grapes, but good, well-grown crops of peaches are seldom seen. The methods employed in the cultivation of peaches vary according to the knowledge possessed by those in charge, but the general practice is of a stereotyped nature, and this is in a measure responsible for the undesirable dropping of the fruit during the stoning period. Some fifteen years ago I deviated from the general method of culture, and since then may say that I have not had a dozen peaches drop in a season out of a thousand grown annually. The chief causes of "dropping" of peaches are undoubtedly a too high temperature, and much too close an atmosphere, during the stoning period. Of course the erroneous idea of leaving twice as many fruits on the trees until the stoning period is over will considerably aggravate the evil. Unsuitable borders and bad management otherwise will all tend towards unhappy results.

If the fruits be reduced to one to every square foot of surface on moderately strong trees before the stoning commences, and the temperature not allowed at any time to exceed 60 degrees without ingress of air until the stoning of the crop is completed, dropping would never be heard of. The general practice of shutting up the houses with sun heat in the afternoon, and running up the temperature even to 80 degrees, is a bad one, and accountable for much of the mischief often seen and complained of. By the cool treatment it, however, takes longer to bring a crop to maturity, but the heavier yields and finer fruits more than repay the extra time required. The pernicious practice of leaving a double crop on the trees during the stoning period proves too great a strain on them at a critical time, and, consequently, contributes largely to the "dropping" which ensues. Not only does it do this, but it also reduces the size of the fruits that are carried to maturity, and reduces the strength of the trees for the succeeding year. Again, unless the borders for the roots of the peach trees are well drained, composed of a good, strong loam, and contain all the essential constituents to the growth of the peach, and these be understood and utilised by the cultivator, unsatisfactory results will follow. Besides this, a knowledge of rational methods of training, &c., must be employed to ensure success. Recently I saw one practitioner stopping the young growths at from six inches to a foot long, and pointed out to him that in all likelihood the fruit buds would either open in the autumn or drop in spring when the plants were started.

Referring to the practice of shutting up the houses and syringing the trees early in the afternoon, I have left the shutting up until the temperature fell below 60 degrees, but syringed between three and four o'clock when the weather was bright and dry. As the stoning of the fruits proves the greatest strain on the trees, stimulants can and should be supplied to them when this process is going on, and perhaps the best for the purpose is a mixture of nitrate of soda and sulphate of ammonia. Mix about equal parts of each, and apply it to the border at the rate of two ounces to the square yard, washing it in with water of the same temperature as the house. The time to apply this stimulant is when the fruits are the size of blackbirds' eggs, and at every watering until the fruits are stoned.

Peach "dropping" and peach stones "splitting" are both due to the same causes. The dropping of the flower buds is due mainly to the buds of early varieties becoming too much developed in autumn, and then receiving a check.

PEACH GROWER.

HARDY SALVIAS.

IN this country salvias are, with the exception of a few half-hardy species, such as Salvia patens and S. splendens, which are used for the furnishing of conservatories or bedding-out, rarely seen. On the Continent, especially the eastern part of Europe, many showy kinds are put to various uses with the greatest effect. They may be seen planted in the open spaces, which have invariably either a few trees or a plot of grass, with a bed or two of perennials of the most robust kinds; or a rockery is formed and these plants luxuriate where many others barely exist, their culture being of the easiest and simplest. Most salvias prefer an exposed, dry, sunny position in poor, stony soil, while others prefer a partially shady position, but none of them are very particular as to the quality of the ground. They are best planted out during the early autumn or early spring, and the long-rooted kinds are best grown in pots and raised from seeds or offsets, because if lifted from the ground they usually suffer through removal, and do not make at once the show when planted out in gardens or parks, where often no protection against wind or sun can be given. Although the genus salvia is a very large one, many of those that inhabit the tropics are half-hardy annuals or perennials, and will not be enumerated here, while of the hardy kinds only the more showy will be mentioned.

Although the ordinary Salvia austriaca is not very large-flowered, there are forms with very showy blooms. It grows one to two feet high, and has radical, ovate or cordate leaves, wrinkled and pubescent; the flowers are yellow or white, and produced in May or June. S. argentea is a biennial, grown on account of its large woolly and silky-white leaves. The flowers are usually less showy, white and fleshy. S. azurea has lanceolate or obtuse leaves, slightly serrate, the cauline ones linear, upper ones diminutive; the bracts are usually showy, and coloured like the flowers, bright azure blue. This is one of the best of the genus. There are also varieties with white and rosy-purple flowers; one species flowers during the late summer and early autumn, and is well adapted for the herbaceous border and pot culture.

S. glutinosa grows two to three feet high, and has stout petiolate, ovate or oblong, pubescent leaves; the flowers are sulphur coloured, or even deeper yellow, and spotted with brown. The stem is usually sticky; flowers appear during the summer. S. pratensis has stems one to three feet high, and oval or oblong leaves, sometimes cordate, rough and wrinkly, with long petioles; the calyx and bracts are usually bluish, but the flowers vary much in colour, and are either blue, purple, white, rosy-purple, or pink. This plant is also a British species, the purple or blue form, however, predominating, but the different coloured varieties are often found in Germany or Switzerland, and still more frequent under culture. Less strong kinds are S. silvestris, S. nemorosa, with smaller flowers, violet, reddish, or white; another variety of S. sylvestris is L. verbenacea, of Southern Austria, with purple-blue flowers and large ovate leaves, the stem being covered with woolly or densely pubescent hairs; it flowers from May till September. S. clandestina is another variety though well defined, differing in the more wrinkled and divided leaves.

S. officinalis, the Common Sage, with its varieties, having violet, purple, or white flowers, is well enough known, and more grown for its culinary worth than for its decorative value. In the more genial climate of the south this species grows into a good-sized shrub. In the same way S. verticillata is grown, a species with small pale blue or pale violet flowers and almost cordate leaves. S. hians has an erect, silky, or pubescent stem one to two feet high; leaves ovate and petiolate, often arrow-shaped; flowers racemose, calyx bell-shaped, and corolla of a bright blue colour; this is one of the prettiest members of the genus Salvia flowering in June and July. S. canescens, with lanceolate, wrinkled, white and woolly leaves, has a stem one to two feet high, covered with a woolly down; the flowers are purple, and less showy than the leaves. S. nutans grows two feet high, pubescent, with bright violet or purple flowers, that appear during June and July. S. ringens is a shrubby kind with ovate, often pinnate leaves, and purple flowers. S. taraxacifolia has rather long pinnatesect leaves, the cauline leaves being broader and shorter, irregularly toothed, and covered with white down beneath; the flowers are rosy or pink, tipped with yellow, and often purple spotted.

S. patens, and its form S. patens alba, are only hardy in the southern part of England. They are best lifted in the late autumn, and stored away like begonias. Their large bright blue or white flowers are very showy, and should be produced by every one. S. splendens and its varieties are greenhouse plants, but they are very useful for bedding out during the summer, and, like S. patens, also well adapted for pot culture.

G. REUTHE.

Cactus Dahlias.—Reading your remarks on the development and exhibiting of these now very beautiful flowers I am induced to specially urge on all compilers of schedules that they make it a condition that in any method of exhibiting these flowers special precautions be taken to have the stems well inserted in water to keep them fresh the whole time the show lasts. The same remark applies to all cut flowers. I have observed in various cases this summer where arrangements have been set up looking fresh enough for an hour or two, and have in that way caught the eyes of the judges favourably. Then ere the afternoon had far advanced, and the tent had become warm, the flowers thus honoured had utterly collapsed. That is such an unsatisfactory way of exhibiting flowers that it cannot be too strongly deprecated. All cut flowers might well be judged early for quality and arrangement, and later for freshness. It is a subject of intense disappointment to visitors when they find, perhaps not later than three or four o'clock, that large quantities of prize flowers have utterly collapsed. I noticed recently in a great show a first prize lot of what were by courtesy called cactus dahlias in a state of miserable collapse at four o'clock, and the show was of two days' duration. Bouquets of sweet peas, dahlias, and roses, stands of numerous flowers, were in the same plight, and all because no provision was made to supply ample moisture to the flowers. I would make it a condition that in all cases in which the flowers did not keep fresh for the first day at least all prizes should be withheld.—A. D.

CHRYSANTHEMUMS AT THE BRIARS, FAWKHAM.

ONE of the most enthusiastic and painstaking amateur growers of chrysanthemums whom it has been my good fortune to meet is Mr. Percy Waterer. The prominent part taken by this gentleman in the affairs of the N.C.S., of which body he acts as vice-chairman of the Executive Committee, has made most chrysanthemum growers familiar with his name, and the excellent exhibits which he has staged from time to time in the best competitions in the open classes, have reflected great credit to his skill as a grower. One of his triumphs was the winning of the American gold medal in 1896 at the Royal Aquarium for a vase of large blooms with their own foliage, and the fact of his exhibit taking fourth prize in the great class of sixty blooms at Edinburgh last November speaks more for his pluck and success than anything yet achieved, because this competition was amongst the best of professional gardeners from various parts of the country. So much for the prowess of the busy city amateur as showing what may be done when one is in earnest.

Recently I had the pleasure of a visit to The Briars, and amongst several things which are well cared for in the pretty garden we found the chrysanthemums. Of these there are some three to four hundred plants, grown for production of specimen blooms, and very promising they [illegible], neatly arranged and securely staked in long rows, with ample room for the proper development of subsequent growth. The collection is confined mainly to the Japanese section, and includes most of the best of recent introductions. The late propagation of several varieties is here found to be a great success, and the better timing of flower buds of [illegible], and more free growth of such sorts as Viviand Morel, and others of similar early bud producing varieties, is an evidence of the merits of [illegible] treatment. Few collections surely can be so pestered with earwigs as are the plants in this garden. So much so, that hundreds are caught, and the devices of "island" pots and a channel of water run round the houses, which is floated over with petroleum when the plants are taken outside, have to be resorted to in order to preserve the buds and flowers. Another expedient is the planting of a clump of dahlias about twenty yards away, amongst which crumpled pieces of brown paper are placed as traps from which the insects may be caught.

Mr. Waterer finds much interest in careful note-taking, and bases much of his practice on his own personal experience of the behaviour of the plants under his care, and this, as I have before urged on young growers, is the most safe road to success. One other hint which I gleaned at Fawkham, and which is certainly good practice, is the placing of a large oyster shell concave side downwards on the surface of the soil, so that when watering the plants the liquid may be poured on to this and thus save swilling the soil from the roots somewhat. W. H. LEES.

THE HONESTY.

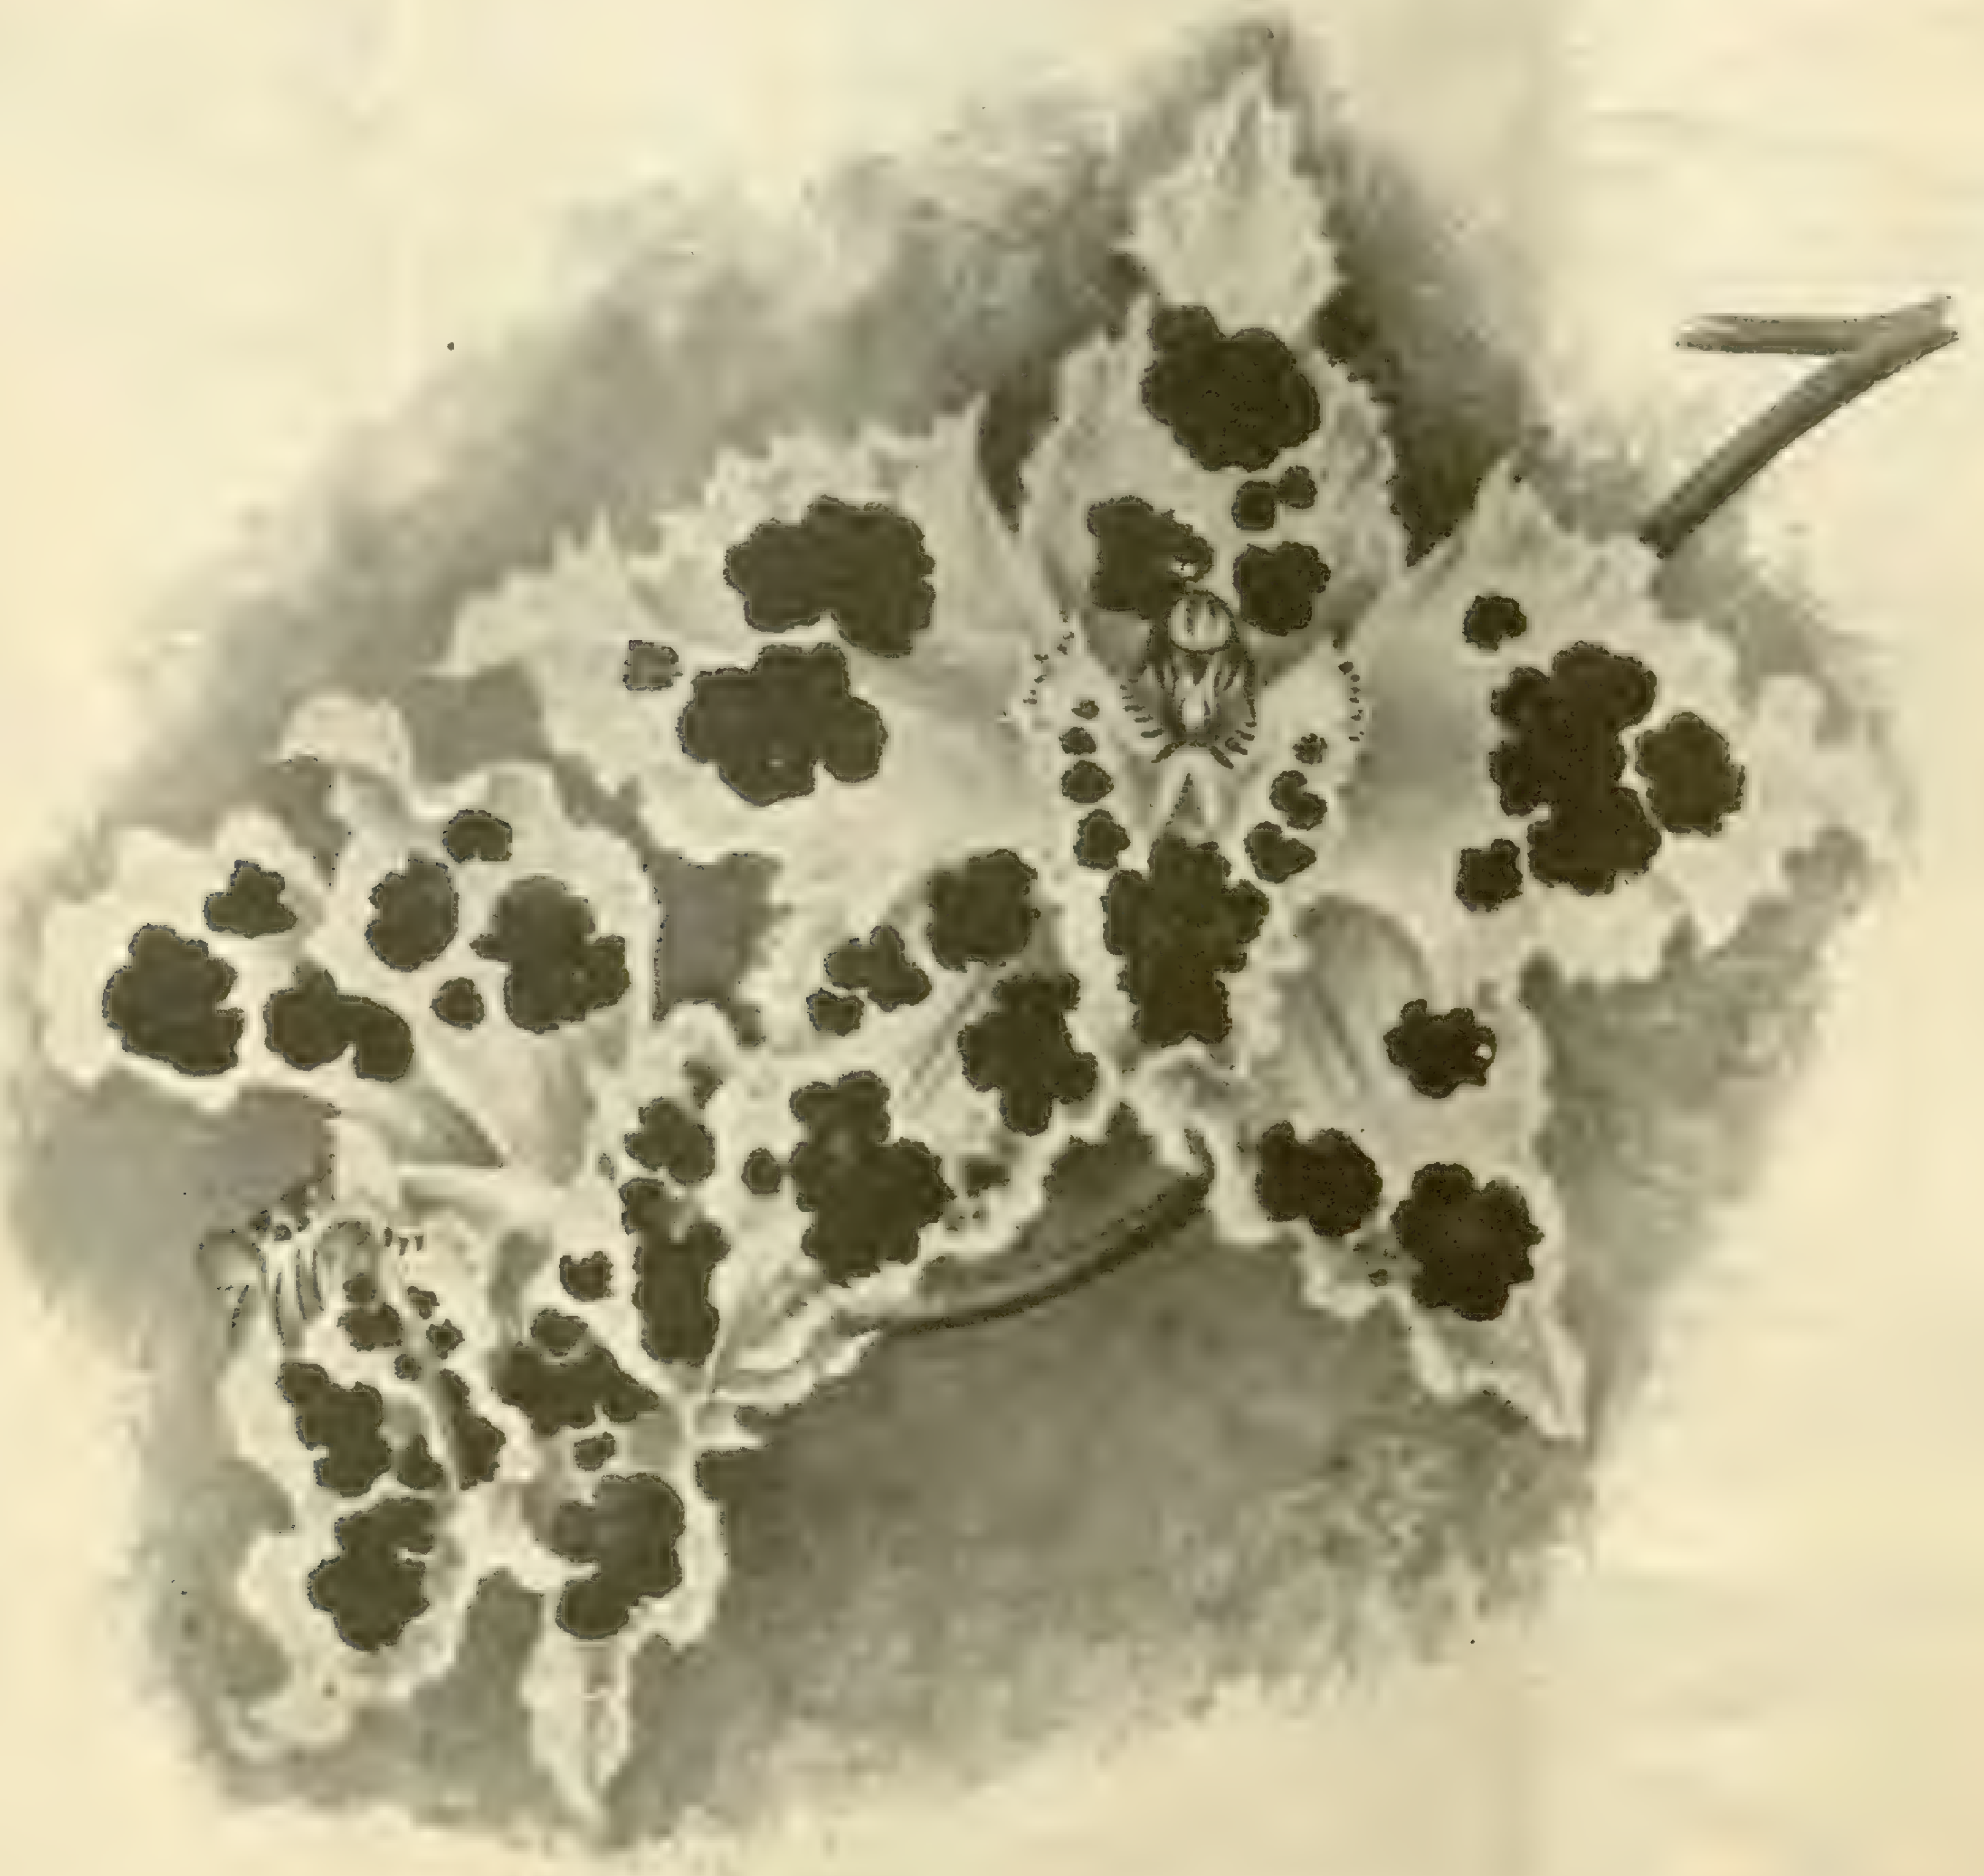
I LIKE the common name of Honesty as applied to Lunaria biennis. It has other common names as well, such as Lunary and Moonwort, no doubt from the disk-like form of its great flat seed vessels, or their silvery and transparent brightness. It is this peculiarity, no doubt, which accounts for its nicknames—White Satin flower, Monkey flower, and Silver plate—all very appropriate. Dr. Prior thinks the name—Honesty—was given to it on account of the transparency of its dissepiments, that is, a term applied to the partitions formed in ovaries by the united sides of cohering carpels, which separate the inside into cells.

For spring blooming the Honesty is invaluable, the plants form dense bushes of blossom when fully in flower, and as side spikes succeed to the central one the duration of bloom is considerable. Then there is diffused from the flowers a pleasant fragrance, which adds to its decorative value in the garden in the spring. The plants do best when they can be raised from seeds sown where the plants are to blossom. Transplanting may certainly be done with safety when the plants are young, but as soon as they grow into size they form a thick fleshy root like a long white radish attached to the base of the plant by a kind of thin cord. This root strikes down deep into the soil, and it is this fact which makes transplanting a difficult and risky process. It is therefore best to dibble in the seeds in drills, and to form a bed, and then thin out as desired, so soon as the plants are large enough to handle; or if clumps are required, to dibble in a few seeds in the form of a circle, and thin out if desired.

It is in a good deep and rather stiff loam that the Honesty flourishes, rooting very deeply; but as it is somewhat of an exhausting plant the ground should be good. It likes to be in an open and sunny position, though I have grown it well in pots somewhat shaded. I have seen it doing well on chalk banks, where its roots can travel along the openings. April and May are the months in which to sow, and then strong plants are formed to flower the following year. It is hardy, but severe frost following drenching rains will disfigure many, if they are not killed outright.

Of varieties there is a dwarfer growing deep-coloured form, known as the Crimson Honesty, which I have sometimes met with growing in a semi-wild state, as I did once in an old farmhouse garden in Kent. Seed grains and foliage, as well as blossoms, are darker in tint than the old type of purple Honesty; there is the white variety also, and a variegated-leaved form, the green leaves handsomely edged with white.

Then the seed pods, when the seed grains are fully ripe and removed from between the transparent sheaths, are found valuable for winter decoration, and are to be met with in many country houses. They mix well with dried grasses and palm leaves, furnishing corners of sitting rooms and halls in a way that adds cheerfulness to the home when without there is dulness and gloom. R. DEAN.



ODONTOGLOSSUM CRISPUM, VAR. MISS ANNA GUDERS.

WALNUTS, ALMONDS, AND CHESTNUTS.

The University of California has, during the past two years, been doing excellent work in determining the chemical composition of walnuts, almonds, and chestnuts, in regard to their requirements and demands upon the fertility of the soil, and their value as human food.

The chief ingredient of the walnut and almond kernel, is the fat (oil), of which in the walnut there is about 65 per cent., and in the almond nearly 58 per cent., for both European and Californian grown nuts; this is nearly equal to the oil content of the olive—65.73 per cent. On the other hand the fat (oil) of the chestnut kernel, is but a small fraction of the food content, viz., from about 3 per cent. in the European, to about 11.63 per cent. in Pennsylvania chestnut. The next largest constituent of the almond and walnut kernel, is the protein, or flesh-forming ingredient—in the almond, from 20 to 25 per cent., and in the ordinary walnut, about 17 per cent.; in the chestnut there is only about 11 per cent., or about one-half that of the other nuts. About three-fourths of the chestnut kernel is made up of starch, sugar, dextrine, &c., which, like the fat, furnish fuel to the body, though less economically.

All authorities agree upon the fact that nuts are a highly concentrated form of human food; caution should, therefore, be followed in their use. Walnuts and almonds possess a higher nutritive value than even the cereal grains; and, as compared with fruits, they rank high in food value, being the true seed only, and not made up mainly of fleshy coverings, as in the apple, pear, &c.; they, therefore, have less water and a higher nutritive value generally, weight for weight.

When, in a rational dietary system, other forms of food lack protein or albuminoids and fat, the walnut and the almond will supply, in concentrated shape, those needs; the chestnut, with its high content of starch, sugar, dextrin, &c., may, on the other hand, be used as a substitute for the cereals. Aside from the chestnut, the edible nuts are looked upon as luxuries, and are quite largely used as such; the chestnut, on the other hand, has long been a staple article of food in Southern Europe.

It is found that the potash in the ash of hulled walnuts comprises nearly 20 per cent. of the whole ingredients, while that of the hull alone is nearly four times as much, viz., 77·8 per cent. It will, therefore, be seen that if the hulls of the walnut are not returned to the soil, the dominant ingredient of the fertiliser intended for replacement must be potash, while if the hulls are left on the ground the chief ingredient by far should be nitrogen. The ashes of the parts of the almond and chestnut, on the whole, show few such wide differences in potash as that above given.

It is an interesting fact that the ash of the kernel of the walnut is, in weight, more than twice that of the shell, while in other nuts it is more nearly equal. Also, that in the kernel of the walnut and almond the phosphoric acid is very largely predominant over the potash, while the reverse is true in the ash of the shell. In the walnut kernel the phosphoric acid comprises nearly 58 per cent. of the ash. In the ash of the chestnut the potash is by far the predominant ingredient in both kernel and shell, and is largest in the kernel. The same is true of the European chestnut. The soda of the European chestnut is nearly twenty times that found in the Californian samples. The European walnut meal has a very large amount of ash. Its potash is greater than in the California sample of walnuts, but the phosphoric acid is still predominant.

In the total quantity of mineral matters withdrawn from the soil the almonds leads with fifteen pounds, the chestnut comes next with 8·2, and the walnut last with 7·5 pounds in 1,000 pounds of the hulled nut. The stone fruits fall much below the above in total ash, excepting the olive, the ash of which, however, is largely silica (nearly eight-ninths), an ingredient so plentifully in all soils that it is of no pecuniary value.

The data for hulled nuts show that almonds withdraw 5·49 pounds of potash, as against 3·7 for chestnuts, and 1·5 for walnuts, for 1,000 pounds of fresh nuts; however, when these figures are referred to the entire fruit, the walnut and almond take about the same quantity, eight to ten pounds, or nearly three times as much as the entire chestnut; with the exception of the olive, the stone fruits do not, on the whole, nearly approach the latter figures for equal weights.

The almond again leads in phosphoric acid, withdrawing 4·33 pounds, the hulled nut of the walnut taking 2·78 and the chestnut only 1·89 per 1,000 pounds of fresh nuts.

These results are again all materially changed when referred to the entire fruit. For equal weights, the stone fruits appear to be very much less exhaustive upon the phosphoric acid of the soil than are the nuts.

Again, the almond leads with 16·4 pounds of nitrogen, not nearly approached by the walnut, with 10·2, or the chestnut with eight pounds of nitrogen withdrawn from the soil per 1,000 pounds of fresh hulled nuts. These figures, while materially altered when calculated for the entire fruit, are still very high, and indicate a great draft upon the soil, for nuts proper carry away all of their large amount of nitrogen, which consequently must be replaced if paying crops are to be continuously produced.

The quantity of nitrogen taken from the soil by a full crop of walnuts and almonds amounts respectively to 40·8 and 32·8 pounds; on the other hand, that of the prune crop is 44·4 pounds, and of an apricot crop 68·7 pounds; the olive crop, on the contrary, takes but 12·0 pounds of nitrogen.

This heavy nitrogen draft by the nut crop is further forcibly illustrated when we carry the calculations to the other soil ingredients. Of these we find the nut crop to remove but a small fraction, as much of potash as prune and apricot crops, and only as much as the olive crop; nearly one-half as much phosphoric acid is taken up by nut crops as by those of the prune and apricot.

Thus it appears that when nut orchards need fertilisers, the first call will ordinarily be for those rich in nitrogen. Phosphoric acid will be next in demand, consequently phosphatic manures must be supplied to nut orchards, but this need will probably not arise as soon for them as for the prune and apricot orchards. If the hulls of the walnut and almonds are returned to the orchard soils, the demand for potash will be kept back for many crops. Chestnuts do not withdraw as much of potash and phosphoric acid as do the other nuts; but they seem to demand that the soil shall contain sulphates, which are found in surprising amounts in the kernel of the nut.

Harpenden. J. J. Willis.

CARNATIONS IN SCOTLAND.

The present season is the best for the full development of border carnations that has been experienced for some years, for not only have the plants been free from disease and are flowering with great freedom, but the blooms have also been large and of good form and substance. The weather has been most favourable to the earlier blooms, and very few have been tarnished by rain, while, judging by the number of unexpanded buds upon the plants, a good supply of flowers may be expected for some weeks yet.

Several beds of the most trustworthy sorts are grown here for decorative purposes, both for the embellishment of the garden, and for cutting as required for decoration in vases, and these for the past month have been one of the most prominent features in the place. Of the varieties thus grown the following have proved the best in their respective colours, whilst for freedom of growth and for producing quantities of bloom they leave but little to be desired: Mary Morris, rose pink, is a great favourite either for making a display of colour in the garden or for cutting. The plant grows about thirty inches in height, with strong, branching stems, which are usually surmounted by eight or ten flowers, well separated from each other on long, stout footstalks, and as these open at much about the same time, there is no loss on cutting the entire stem by having several unopened buds; the side growths are generally terminated by a single bud, and as these are from eight to twelve inches in length, and strong enough to support the flowers, they are most useful for small vases. The flowers are large, of fine form and substance, and always open well. The now well-known Duchess of Fife is the best of the self pink varieties, and it has proved to be a good grower, and very free in flowering, but has a more drooping habit than Mary Morris. Mrs. Muir and Alice Ayres may be classed together so far as their habit of growth is concerned; the former is pure white, and the flowers are of good size and always opens well, while the latter has a dash of carmine upon a white ground; both bloom very freely.

Uriah Pike is the best dark colour, and the plants appear to improve in robustness as time goes on; like most very dark colours the flowers of this are apt to be discoloured rather quickly under a bright sun, but if wanted for any special purpose they may be cut as soon as expanded, and the beautiful colour is retained.

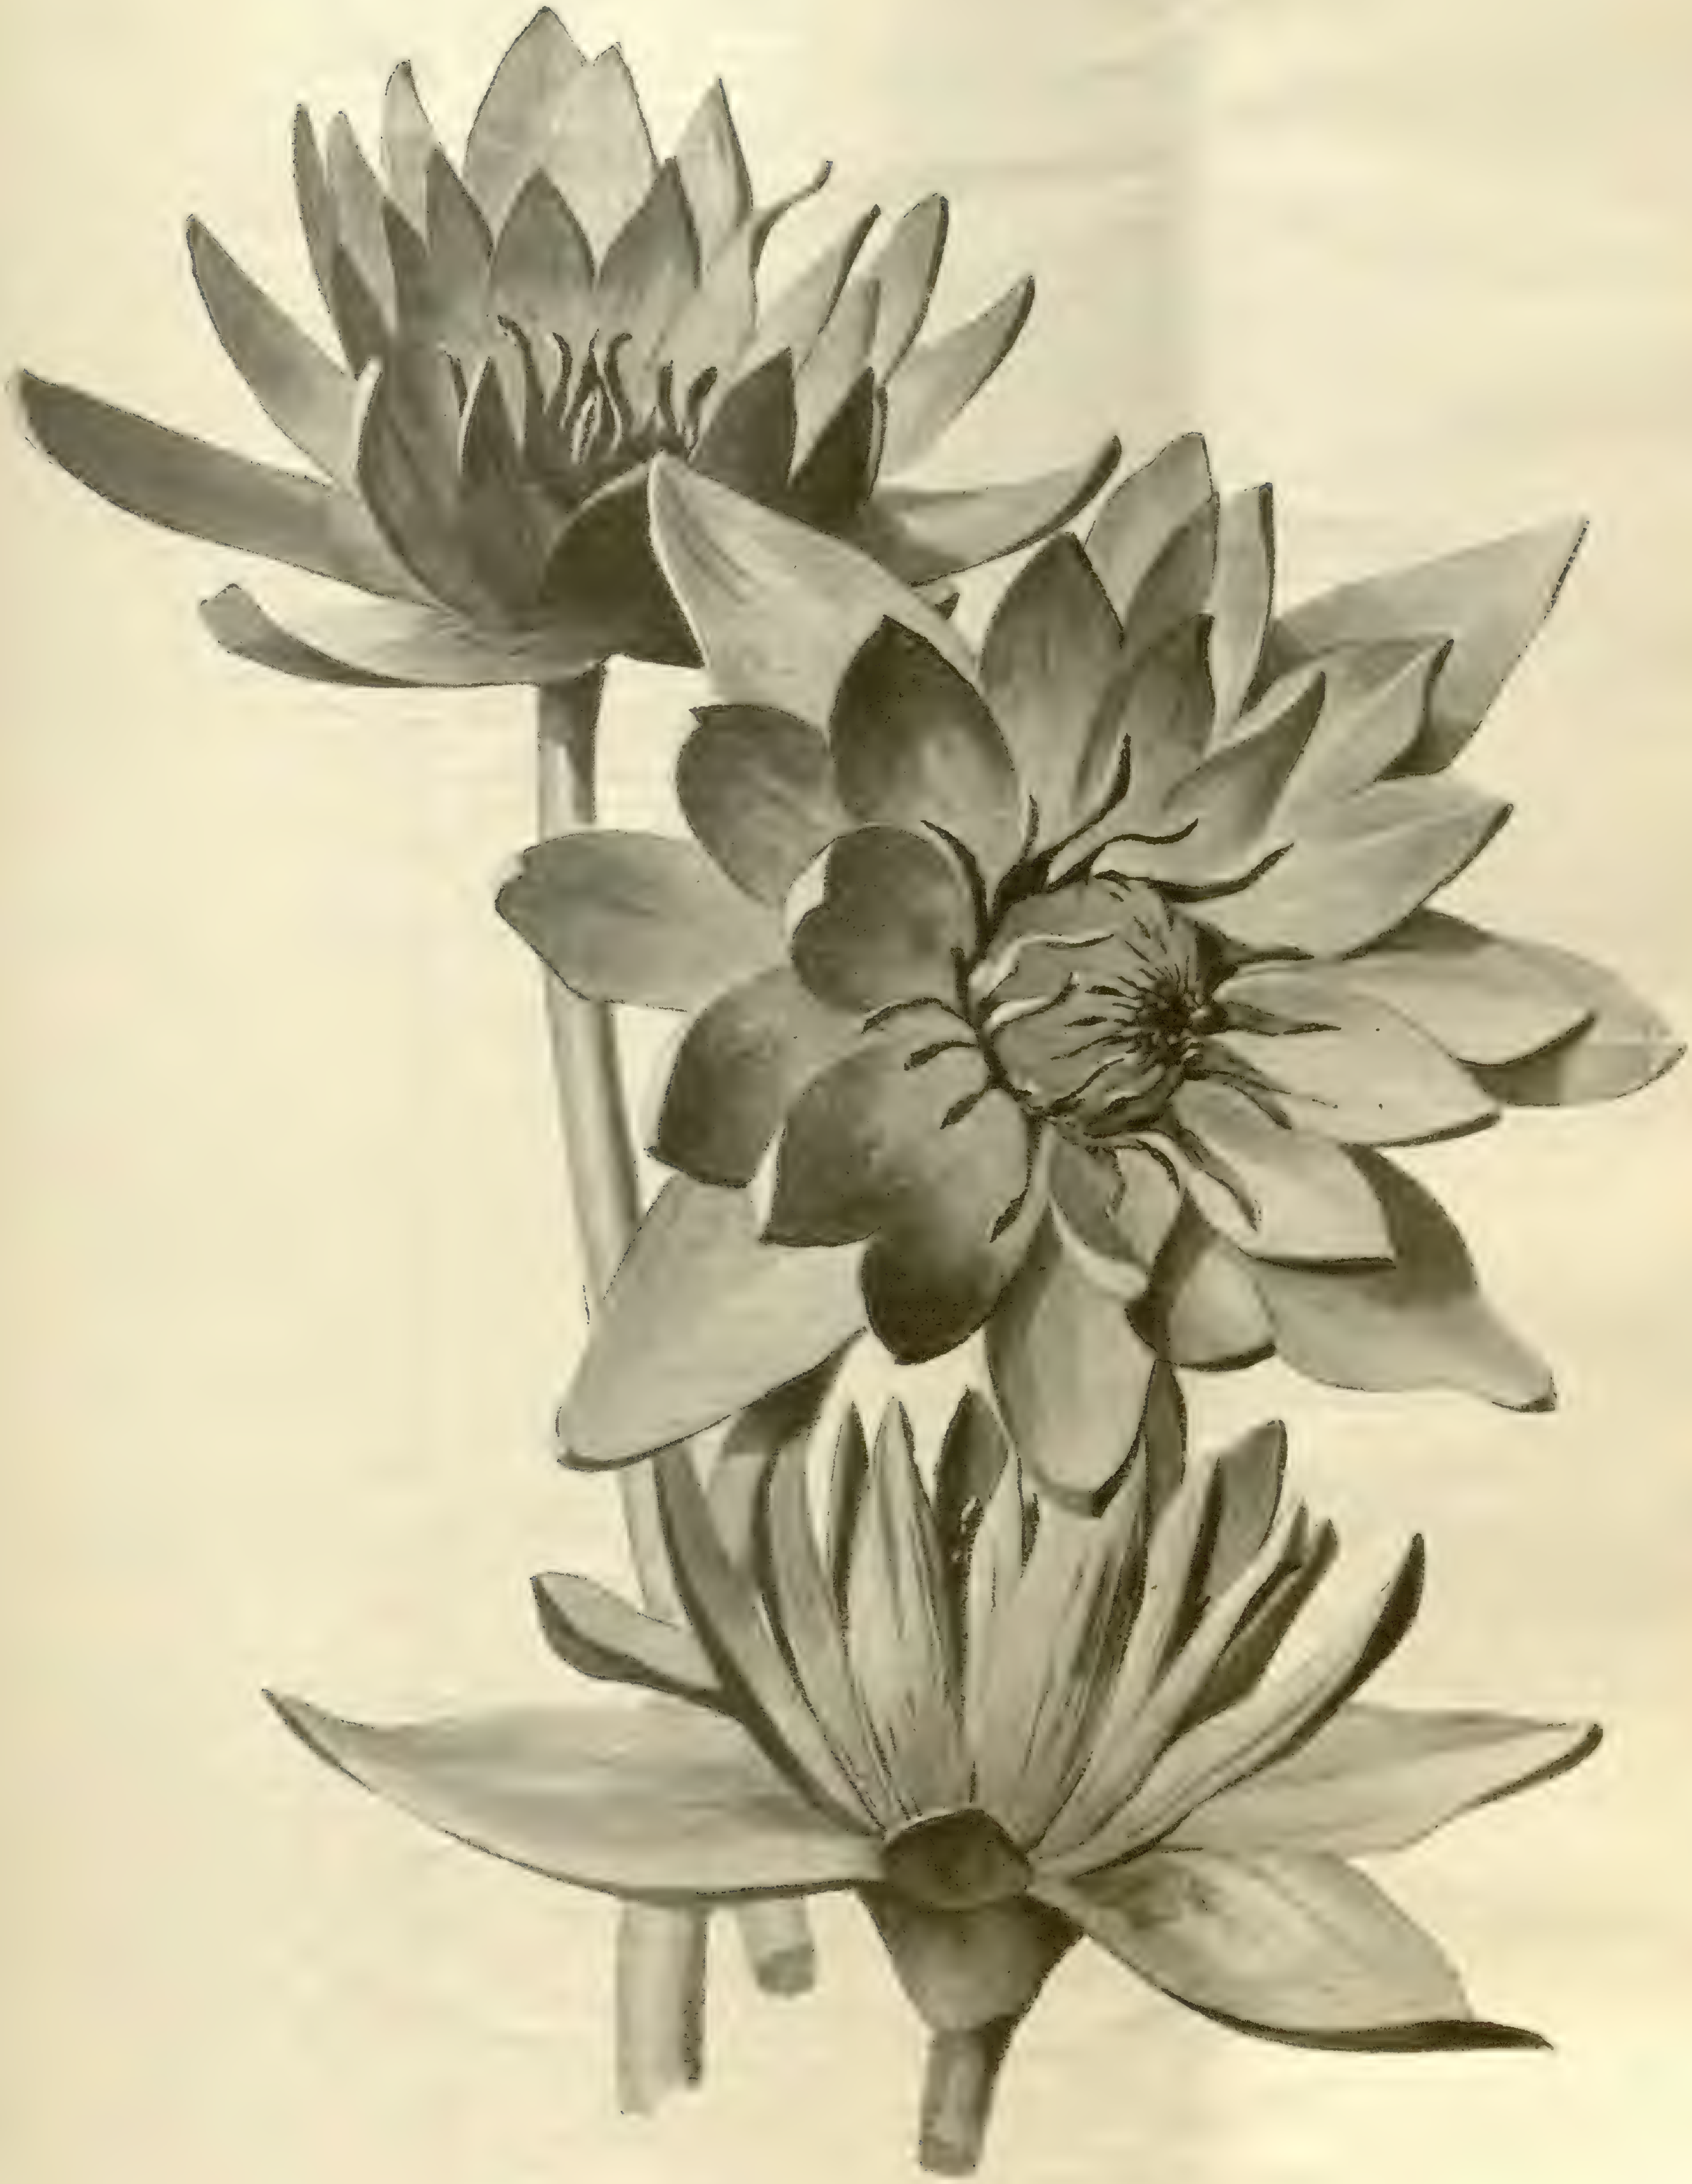
Queen of Bedders, deep rose, is the best in its colour, which is very pleasing; the plant is dwarf, and very free flowering, and makes an excellent mass of colour. Mrs. Reynolds Hole has been for years one of our standard varieties, but this year it is not doing so well as formerly.

Redbraes, picotee, has been cultivated here for many years, and the plants are as healthy now as at first. This is a fitting companion to Mary Morris, their height and profuseness of flowering being very similar. The marking or edging of this is rather too heavy for a show flower, but for producing quantities of bloom upon the open border it is most useful, and owing to the amount of growth that it makes, it is very easily propagated.

Galloway House, Garliestown, N.B. James Day.

NYMPHÆA STELLATA.

The star-like nymphæa has long been regarded with much favour by cultivators of tropical water lilies, and deservedly so, for of the comparatively large number of species now in cultivation in English gardens none of them are superior to it in beauty. It would appear also that Nymphæa stellata was as great a favourite with the ancient Egyptians as with the present-day cultivators, for it was frequently represented on their old monuments, and also used in their funeral wreaths. The species is, therefore, of special interest, and it is a matter of considerable importance that it has a robust constitution, and can be successfully cultivated without any special difficulties having to be surmounted. The conditions under which it can be grown to a high degree of perfection under glass are well understood by those who have charge of a tank in the stove for the cultivation of aquatics requiring the temperature of that structure, and therefore need not now be referred to. But it is not generally known that it may be cultivated and flowered satisfactorily in tanks in the open, provided the water is heated to a temperature of about 80 degrees, and we have no doubt many of our readers will be pleased to learn that so distinct and beautiful a species can be grown during the summer months without the aid of glass. There is, of course, nothing new in the cultivation of tropical water lilies in open tanks containing artificially-warmed water, and Victoria regia was so grown to a very high degree of success in a Chelsea nursery within a comparatively short period of its introduction to this country. This fact does not detract from the value of the services rendered by Mr. J. Hudson, of the Gunnersbury House Gardens, in demonstrating the possibility of having this exquisitely beautiful nymphæa in the highest degree of perfection in an open tank. Mr. Hudson has a small tank fixed outside one of the plant houses, and through this flow and return hot-water pipes, one of each, is taken. But, of course, there would be no difficulty in warming the water of a small pond some distance from the boiler by which the stove or orchid house is heated if it was so desired. The flowers of the species are of an exquisite shade of bright blue, with a delicate perfume not unlike that of the violet, and they are borne on stout stalks some distance above the surface of the water. Some experiments are being conducted at Kew in the cultivation of the more tender nymphæas in the open, and the results can hardly fail to be of much interest.



NYMPHÆA STELLATA. (Flowers bright cærulean blue.)

A VISIT TO SAWBRIDGEWORTH.

To those who are more or less concerned with the all-important question of fruit production, whether for home use or the supply of the markets, a visit to the Sawbridgeworth Nurseries, which enjoy, and deservedly so, a world wide reputation, is at all times interesting and instructive; but possibly the interest is greater, and the object lessons more striking when the summer is approaching its close, and the abundance of finely-developed and rapidly-ripening fruit testify to the soundness of the position long since taken up by the Messrs. Rivers on the question of fruit culture, and the remarkable skill that is brought to bear upon the management of the several departments. However that may be, a walk through the orchards under glass and in the open, and an inspection of the enormous breadths of young fruit trees in various stages of development, with Mr. T. Francis Rivers, the highly esteemed head of the firm, as guide, is pleasant and profitable, for in the course of the perambulation much information relating to the several aspects of fruit culture is obtained in an agreeable manner. At Sawbridgeworth the production of fruit on a large scale is associated with the manufacture of trees by the tens of thousands, and consequently it is not only possible to see at a glance the conditions under which the trees are being prepared for the several methods of culture, but the wide-spreading orchards, on the formation of which so much scientific and practical knowledge has been brought to bear, demonstrate the methods by which the trees may be the most profitably utilised. The knowledge thus gained of the peculiarities of varieties, the influence of stocks, relative merits of the several forms of trees, and the distances and methods of planting must be of immense value, and there can be no doubt that fruit growers appreciate the public spirit shown by the firm in freely communicating their experience to those in need of information.

One of the most important features of the nurseries is the orchard-house culture of choice fruits, which originated at Sawbridgeworth, and has been brought to so high a degree of perfection by the firm. For a considerable period after the late Mr. Thomas Rivers first advocated the cultivation of peaches and nectarines in pots as the best means of obtaining abundant supplies of these luscious fruits, the pot-culture of fruit trees was not regarded with special favour by any considerable proportion of the horticultural community, chiefly because of the labour involved in supplying the trees with water. But the firm, convinced of the advantages of pot culture, have not at any time during the forty or fifty years that have elapsed since the system was first introduced to public notice wavered in their allegiance to it, and during the past fifteen years or so this system of culture has attained to a high degree of popularity. Trees grown in pots under glass necessarily require more attention in a given period than do those trained to open walls; but the fact is now recognised that, in consequence of the uncertainty of the results, it may be necessary to give the wall trees two or three years' attention for each crop of fruit obtained, whilst the pot trees will give a satisfactory crop annually. The regularity of the yield is a strong point in favour of the cultivation of peaches, nectarines, and some other kinds under glass, and with the trees in pots it is possible to grow a larger number of varieties than would otherwise be practicable. In the cultivation of fruits for market, the largest profit is derived from growing a few varieties; but in maintaining the home supply it is desirable to have a rather large selection of varieties ripening at various periods, and thus obtain a continuous succession of fruit extending over several months from the same structure. Mr. T. F. Rivers is of the opinion—and this is based on close observation and long experience—that from a span-roof orchard-house one hundred feet in length and twenty-four feet in width, filled with pot trees, will provide an ample supply of fruit from May till October. This is a point of some importance, for the fruit is available for use during the whole of the summer, when it is the most highly esteemed. From one of the houses at Sawbridgeworth of these dimensions, 3,816 peaches and nectarines have been gathered in one season, the same house giving shelter from spring frosts to pears, plums, and apples, which were taken out of doors for the summer to finish up their crops. This year upwards of three thousand fruits of Early Rivers nectarine were gathered and marketed in April from a houseful of pot trees which had received but little assistance from fire heat. Combining large size and brilliant colouring with earliness, it is not surprising that this variety should have become immensely popular with growers for market, and is being extensively planted in private gardens.

The number of orchard houses at Sawbridgeworth is considerable, and they show some variation in design, but they all agree in being spacious, substantial, and efficiently ventilated. Ventilators are provided along the sides and at the apex, for a free circulation of air about the trees is considered essential to their wellbeing and to the full development of the characteristic colour and flavour of the fruits of the several varieties. The houses also agree in having a soil surface, which is considered preferable to a paved floor, as not only can the pots be plunged in the soil but the moisture rising from the loose surface increases the humidity of the atmosphere and thereby contributes to the health of the trees. The peach and nectarine trees of fruiting size, of which there are many hundreds, range from perfectly-formed pyramids from twelve to fifteen feet high to shapely bushes with a height of three or four feet. From the earlier houses the fruit had been gathered when we were at Sawbridgeworth at the end of August, but in the later structures there were immense crops of fruit of the highest quality. The trees occupying eight and ten inch pots were carrying from four to five dozen fruits each, while the huge pyramids in larger pots had proportionately heavier crops. One might discuss at some length the relative merits of the peaches and nectarines that by reason of their productiveness and high quality demonstrated their value for pot culture, but it must suffice to mention the names only of a few of the best. The peaches of special excellence include Alexander, Amsden June, Early Louise, Hales Early, Dagmar, Condor, Crimson Galande, Early Grosse Mignonne, Goshawk, Alexandra Noblesse, Royal George, Stirling Castle, Barrington, Sea Eagle, Gladstone, Lady Palmerston, Princess of Wales, and Late Admirable. Nectarines of high value comprise Cardinal, Early Rivers, Lord Napier, Dryden, Goldoni, Stanwick Elruge, Humboldt, Rivers' Orange, Pine Apple, and Victoria.

The culture of cherries, plums, pears, and apples in pots is carried on very extensively, and with the same high degree of success as in the case of the peaches and nectarines. We were specially interested in the house devoted to cherries, for many of the trees are of great age and considerable dimensions, and all were in robust health. From the earlier varieties the crop had been gathered, but there was an abundance of fruit of mid-season and late varieties, for cherries, like grapes, will hang long after they have attained maturity, and improve during the greater part of the time. They will hang for a month or six weeks upon the trees, and during this period become so luscious as to surprise those conversant with cherries produced in the open and gathered as soon as ripe. We met at Sawbridgeworth with several varieties, as yet not generally known, which have fruits so large, handsome, and highly flavoured as to justify their having a place in the smallest collection. Especially noteworthy are Bigarreau de Schreken, Early Rivers, Emperor Francis, Geant de Hedelfinger, and Bigarreau Noir de Guban, the last three being remarkable for the immense size of the fruit. From this house a plentiful supply is obtained from May until September, and such fruit as is here obtained would be found a very acceptable addition to the dessert throughout this comparatively long period. Plums are grown with the same degree of success as the cherries, and of the varieties grown in pots, we were especially struck by the Early Transparent, Golden Transparent, and Late Transparent, three handsome gages raised by the firm, and all remarkable for their delicious flavour. The chief points of difference in the trio is in time of ripening, and from them a succession may be had for at least two months.

The cultivation of apples and pears in pots may at first sight appear less desirable than the pot culture of the stone fruits mentioned, but it is not possible to walk through the houses and quarters in which the apples are grown, or devote a short time to an examination of the groups of pears outside at Sawbridgeworth without being convinced that the system has much to recommend it. This year, the choicer pears grown against walls and in the open quarters are in many cases producing a very light crop, if they have not completely failed to produce fruit; but the pot trees at Sawbridgeworth are as heavily fruited as the strength of the trees will permit, and the aggregate produce will be very large. The chief advantage of growing pears in pots is the certainty of an annual crop of fruit of high quality, and this advantage is sufficient to counter-balance the additional labour involved in this method of culture. As so well known the great hindrance to the successful culture of pears in the United Kingdom is the liability of the flowers and the young fruits to injury from spring frosts, and it is by no means an exceptional experience for cultivators situate in favourable districts to see the whole of the crop swept away by two or three sharp frosts or a spell of cold, wet weather when the trees are in bloom. To obviate this risk the trees at Sawbridgeworth are grown in pots, and from February until the end of May they have a place in the orchard house where they can be kept safe from frosts and the effects of a period of cold, wet weather. Here they invariably set a heavy crop, and when there is no further risk of frost they are taken out of doors to a warm and somewhat sheltered position, and have their pots plunged to nearly level with the rim in a border of moderately rich soil. Those grown in pots with perforated sides root freely into the border, and the great masses of fibrils that push from the perforations must render valuable aid to the tree in supplying the food necessary for the development of the growth and fruit. When the trees are lifted from the borders the roots extending beyond the pot are cut away, and this process is repeated year by year with evident advantage. As the trees can be arranged rather close together during the earlier stages of growth a large number can be accommodated in a house in proportion to its size; and in many gardens sufficient pear trees could be flowered in an orchard house devoted to peaches and nectarines to produce a liberal supply of fruit throughout the season. Pears are not kept wholly under glass, for it is found that the fruit ripening in the orchard house is not so highly flavoured as when fully exposed to atmospheric influences from the end of May onwards. Apples, on the other hand, attain to a high degree of perfection both as regards appearance and quality when ripened in the orchard house. There is one other detail to which special attention is given at Sawbridgeworth, and that is the protection of the fruit of pears in pots from birds, and we refer to it because of the many instances which come under our notice of pears being rendered worthless by tomtits and other birds. At Sawbridgeworth protection is given by means of old fish nets supported by strips of deal, and this has the advantage of being inexpensive and simple.

The plum orchards at Sawbridgeworth are of special interest, inasmuch as they serve to illustrate in a marked manner the immense value of the services that have been rendered the community by the firm in raising and distributing the plums with which the name of Rivers is so intimately associated. The three varieties of special importance from the market point of view are Early Rivers, the Czar, and Monarch, and of each of these there are immense orchards which serve to show the suitability of the trio for market culture and it may be assumed to be a source of profit to the firm. Early Rivers, now highly popular as one of the finest of the early plums, has this season been so heavily cropped as to render the use of stout supports necessary. The trees from which the crop had not been gathered were quite black with the fruit which weighed down the branches. The Czar, which formed an admirable succession to Early Rivers was also bearing enormous crops and the Monarch was not less productive. These yield a continuous succession, and it is of interest to mention that the fruit of the last named, which does not reach maturity until September is well advanced, is not liable to crack from an excess of moisture as in the case of other late varieties, Belle de Louvain has also been largely planted and is held in high estimation for its productiveness and other good qualities, some of the older orchards are formed with standard trees, but Mr. T. F. Rivers considers bush trees decidedly the best, inasmuch as the fruit can be gathered by women without injury to the trees and the cost of marketing materially reduced. The more recently planted apple orchards have also been formed with bush trees and with satisfactory results, Worcester Pearmain and other of the sure bearing varieties carrying excellent crops.

In turning from the orchards to the young trees that are being prepared for supplying the demand from planters much is found that is of interest in its relation to this phase of fruit culture. It will probably be of interest to mention that associated with the home nursery is a freehold farm many hundreds of acres in extent, which is largely utilised in the production of fruit trees. The farm is within a short distance of the home nurseries, and spreads over the upper part of the south-western slopes of the valley of the Stort, and it is therefore convenient of access, and by reason of its exposed position is especially favourable to the proper ripening of the wood as well as fruit. The soil is a deep friable loam, equally adapted to the growth of fruit trees, cereals, and roots, and we consequently see all three growing in association, with manifest advantage to each. Fruit trees are so exhaustive of certain constituents of the soil that it is a great advantage to give the land a rest from three to four years; and, appreciating this, Messrs. Rivers have adopted a system of rotation by which at least three farm crops are taken from land that has been occupied by fruit trees before it is again planted with stocks. By adopting this course of procedure the several breadths of trees have the advantage of what is practically new land, and in consequence a vigorous growth is obtained without heavy manuring, which has a tendency to produce soft, large-jointed wood and fat roots. It is not possible to conceive conditions more favourable to the development of an abundance of fibrous roots and firm, short-jointed wood; and therefore it is not surprising that the tens of thousands of trees which form such a conspicuous feature of Roderick's farm should present the appearance the experienced planter so justly admires. Three-year-old apple trees on the Paradise stock have from five to seven shoots, each of an average length of four feet, the shoots being stout and short-jointed, and leave no doubt in the mind with regard to their attaining perfect maturity. What is true of the apple trees in their third year is true of all other fruit trees in the preparatory quarters; for, without exception, they are making a free, healthy growth, without the slightest indication of a check from drought or any other cause, and give ample promise of growing into handsome and fruitful trees when transferred to their permanent quarters in various parts of the United Kingdom.

WORK FOR THE WEEK.

COOL ORCHIDS.

COOL orchids that have been grown in pits or garden frames during the summer months should now be removed to their winter quarters, as the nights are becoming chilly; before removing them let the house in which they are to pass the winter be thoroughly cleansed, washing the glass inside and out, and thus enabling the plants to have all the light possible to ensure both substance and strength in the growths now in progress. The plants should also be sponged and arranged so that each will have its share of light. Plants of Odontoglossum crispum that were potted last month are now rooting freely from the base of the young growths, but great judgment must still be exercised in watering, as the compost though appearing dry on the surface is often sufficiently moist underneath; repotting should be pushed on with, if not already finished, as I do not advise disturbing plants any later than the end of this month. Lycastes are now forming their bulbs and rooting freely, and therefore should receive a good supply of water at the root until the bulbs are made up. Anguloas are fast making up their bulbs, and should also receive a liberal supply of water until these are completed, after which a much less supply will suffice. The pleiones should now have less water given at the root, as these have now about completed their growth for this season; the leaves, being partially decayed, will soon fall off. Care must, however, be taken not to allow the plants to become dust-dry until the flowering period is over.

Bletia hyacinthina that has been standing outside during the summer must now be brought in, and placed in a dry cool position in which to pass the winter. Disa grandiflora and other species of Disa, having finished flowering, will now be sending up new growths from the sides of the old flower spikes; therefore, the repotting of these should be attended to, the present time being the most suitable for this operation. Well-drained pots or pans should be used, placing a layer of clean moss over the drainage, and prepare a compost consisting of three parts roughly broken peat to one of good fibrous loam, with a little chopped moss and coarse silver sand added; a few small lumps of sandstone and charcoal may be mixed in, as these help to keep the soil from becoming sour. After repotting is completed a good soaking of water is required to settle the compost; but after this only sufficient will be needed to keep it just moist. The plants must now be placed out of reach of frost, but the coolest possible position should be given them; thus a place may be found for them on a shelf near the glass close to the ventilators at the coolest end of the odontoglossum house. Keep a sharp look-out for thrips and green fly, the latter being almost sure to put in an appearance now.—E. SHILL, *New Hall Hey Gardens.*

KITCHEN GARDEN.

THE continued dry weather has made it difficult to establish newly-planted stuff, particularly endive and lettuce, but where the precaution was taken to shade the young plants until new roots were formed, these will have made some headway. With us the soil has become so dry as to be almost unworkable. As soon as rains come, preparations should be made for planting the spring cabbage, for unless this is done soon the plants will not have time to become established before the cold weather sets in. Onions in most districts will now be ready for lifting. The bulbs should be exposed for some time until the foliage has become thoroughly dried, after which they should be stored in a cool open shed. When well ripened, the most severe frost we have does them no harm if left undisturbed till they become thawed. We have had them subjected to 32 deg. of frost, and they have not suffered in the least. The varieties of the Brown Globe type keep sound much longer than those of the Spanish, therefore such should be reserved for spring use. The lifting and storing of potatos will now be an important item, and should have every attention paid to it. With us the crop is not so heavy as it has been some seasons, as the haulm was cut down by the late frosts in May. A few varieties, however, have done marvellously well, considering the season. Carter's Snowball is one of these. The tubers were of even size, good in shape, and of first-class quality. Sutton's Invincible was another, as was Ideal, all of which produced enormous crops. The ground from which the tubers were lifted has heen sown with early turnips, as small roots of these are in great demand in the early spring. Winter spinach should be encouraged to grow as quickly as possible by being supplied with plenty of moisture. The rainfall with us is but little more than half the average, and the heat for some time past has averaged about 80 degrees in the shade for a good portion of the day.

Manure should now be prepared for making mushroom beds for winter. With the external air so warm spawning must be done with care, or the heat will be too great, and so destroy it. It has been a good time of late to clear the garden of weeds. Advantage should therefore be taken of such weather whenever it is possible to clean the ground by hoeing, but much as tidyness is to be commended this should not be done at the expense of neglecting watering, for if crops are to be had with such weather as we have been experiencing of late the water-pot and hose must almost be kept in constant use. Now is a good time to wheel manure out to all vacant plots as the crops are lifted for the ground being so dry but little impression will be made in wheeling. In low-lying places we may soon expect frost, therefore it is well to be prepared. We have registered two degrees here, which makes us on the watch.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

By the time these notes appear the peach season will be fast drawing to a close, and most of the trees, except of very late varieties, will be cleared of their fruits. As this occurs, the fullest amount of ventilation night and day should be given, and houses ventilated on the old-fashioned principle of sliding lights have a great advantage over those ventilated in more modern ways, as half—and the most important half—of the trees can be fully exposed to the weather, and they will derive much good both from the fresh air and from the heavy night dews which fall in the autumn. It would be a great boon to growers, and tend to the health of the main-crop peach and nectarine trees, if some simple and easily-worked means of complete exposure at this season could be devised, and the more nearly we get to this the better the trees will be. If red spider is present the trees should be syringed forcibly and plentifully once or twice a day until most of their leaves have fallen or while any of the enemy remain. It is advisable now to remove a considerable portion of the spare wood, especially if the branches are at all thick, as this will help the present year's growth to ripen thoroughly, but I neither advise nor practise the complete pruning of the trees at this season, not that the practice is a bad one in itself, but I think the work may be done more readily when the leaves have departed. It is sufficient now to cut away the majority of the shoots that have fruited during the present season, provided they are not required for the extension of the trees. See that the borders are kept well supplied with water; to cease watering when the trees have yielded up their crop is one of the greatest errors that can be committed in peach culture and leads to many evils, one of the greatest of which is bud-dropping in spring, and one may readily realise how common an evil this is by reading the numerous queries which appear on the matter every year, and which would be materially lessened in number if sufficient attention were paid to the watering of borders when approaching dryness at any time of the year. The present, and from now onwards until the end of autumn, is the best season of the whole year for planting or replanting operations. This subject has been treated recently, and I only again allude to it as a reminder that no time nor opportunity should be lost in setting about it, also to insist once more on the absolute necessity of providing lime in the new border; given that, and a sufficient depth of soil, the nature of the staple soil matters but little, and peaches can be as well grown in any reasonably good garden soil as in the most elaborately made borders.

Very late peaches are much appreciated for dessert, for their appearance pleases, even though the flavour may not be equal to that of those gone before. The fruits, if picked before fully ripe, will keep well in a cool, dry room; they should be picked carefully and placed well apart from each other in boxes which have been thickly lined with cotton wool or the softest of wood wool, over either of which should be spread a sheet of thin waxed or oiled paper, and on this the fruits. Careful selection and handling will then extend the season for ten days or a fortnight. The very latest peaches I ever had were kept after gathering in an ice house. These remained sound and pleasing to the eye for weeks, but the flavour deteriorated sadly in the meanwhile, and unless required for a special object the plan is not to be recommended. Where the young stock of pines is insufficient no delay should be permitted in potting up more suckers to meet the requirements, as operations of this kind are best suspended through the winter. There is still time to give earlier suckers now in small pots a shift into those a size or two larger, but avoid anything like over-potting at this season.—J. C. TALLACK, *Livermere Park Gardens.*

THE OLIVE.

THAT fungus tribe is at work again. Years ago its emissaries rotted the potato; then they ruined the vines; now they have attacked the olive. Nothing is sacred from these aggressive organisms; they are here, there, and everywhere—in the grain plants and the vegetables; blighting the corn, blistering the tea leaves, and even corrupting the bulbs of Japanese lilies.

A minute fungus has been discovered which attacks the fruit of the olive, and produces a small round spot on the berry, which results in its destruction. It appeared nine years ago in Italy; in 1891 it had also infected the South of France; and no doubt, before long, will invade other countries, though as yet Spain and Tunis are said to have been spared. The outlook is a gloomy one, for anything like a permanent failure in the olive crop would mean ruin to many agriculturists, and the destruction of a profitable industry. Some few years ago the area of land devoted to olive culture in Italy alone was given as two and a-quarter million acres, and the total production of olive oil as some ninety millions of gallons. This would make a respectable lake. If all were poured into one reservoir it would have to be four hundred yards square and ten feet deep. Other vegetable oils there are, but none of them equal, for dietary purposes, to man's old friend—the olive, though some of them, on the "cheap and nasty" principle, have been too often used of late years by the adulterator to spoil the flavour of the genuine article. One of these goes by the name of Gingelie, the product of a plant called Sesamum indicum, which is largely exported from India, and, amongst other places, to France and Italy. Another is cotton-seed oil, which has now become a very important product, and of this, at the beginning of the present decade, over three hundred and fourteen thousand tons were brought to our own country alone, most of it coming from Egypt.

But a certain sentiment attaches itself to the produce of the olive tree, which not even the discovery of a substitute, or the most successful result of synthetic chemistry, would entirely replace. It is such an old-time memory—"Wine that maketh glad the heart of man, and oil to give him a cheerful countenance!" The vine and the olive go so very far back in human history. We hear of the latter in the first consecration ceremony, when the fugitive Patriarch poured oil on the rude stone which he reared on the hillside at Bethel. It figures again and again in Hebrew history, in the anointing of priest and king, as a symbol of honour or of prosperity. It was just as familiar in Greece and in Rome as it was in Palestine, and is among Southern nations at the present day—nay, probably was then in more general use, because the substitutes were fewer. There was good and bad then, as Horace knew well; and the athletes of old set as much store on simple oil as their successors would do on the more pungent liniments of modern times. Centuries, we might almost say milleniums, of cultivation have vastly improved the fruit. The home of the plant is Syria and the adjacent region of Asia. There the olive grows wild, as we incidentally learn from the well-known simile of grafting the result of cultivation on the original stock. In that condition it is a small tree, hardly more than a shrub, and thorny. With cultivation it attains a greater size, not only in fruit, but also in bole and branch, becoming a tree some thirty feet in height. It also loses its thorns—an effect of culture which has, says the *Standard*, been noted in beings at the top of the animal kingdom.

At what date the olive was introduced into European regions we do not know. It flourishes all about the Mediterranean; but though the tree can exist in the south of England under favourable conditions, our climate is too severe for it to do any good. It was taken to the New World by the Spaniards, and in some parts has done well, and is now cultivated in Australia. Apart from its commercial importance, the olive is a tree of considerable natural beauty. Where it is grown only for its fruit, much cannot be said either for its foliage or grace of form; but when it is allowed to grow freely on the hillside it is really handsome. Those who have seen the group of old olive trees on the way from Monte Carlo to Mentone will not refuse them their meed of praise; and there is something very attractive in the grey, glaucous tint of the leaves when they clothe the slopes of the Eastern Riviera or rise among the ruins of Central Italy.

Hollyhocks at Hampton Court.—These fine border flowers constitute to myriads of visitors just now not the least of the floral attractions offered in these popular gardens. The majority are of a fine double strain, but some are single. Very many like the singles best, but as a rule they do not give the massive spike the doubles do. Of course, the plants are not free from the insidious fungus, but as many of them are rather old plants that is not to be wondered at. Generally the hollyhocks line the long east border that margins the broad terrace walk, and as they get some shade no doubt they like it. The gardens are very beautiful just now, the bedding being very diversely arranged from what has been seen in the past; and the result is to encourage visits from all classes in great numbers. It will be productive of great good if the hollyhocks at the Palace Gardens help to give desired stimulus to their culture generally.—A. D.

FOOD SUPPLIES AND LAND FERTILITY.

AS stated in our issue of the 10th inst., Sir W. Crookes devoted the earlier part of his presidential address at the opening meeting of the British Association at Bristol to a discussion of the wheat supplies and the maintenance of the fertility of the land. This section of the address is of much importance and we make a few extracts from it that are likely to be of special interest to our readers.

WHEAT SUPPLY OF THE UNITED KINGDOM.

In his opening remarks, Sir W. Crookes said :—I owe an apology to this brilliant audience. I must ask you to bear with me for ten minutes, for I am afraid what I now have to say will prove rather dull. Statistics are rarely attractive to a listening audience ; but they are necessary evils, and those of this evening are unusually doleful. Nevertheless, when we have proceeded a little way on our journey I hope you will see that the river of figures is not hopelessly dreary. My chief subject is of interest to the whole world—to every race—to every human being. It is of urgent importance to-day, and it is a life and death question for generations to come. I mean the question of food supply. Many of my statements you may think are of the alarmist order ; certainly they are depressing ; but they are founded on stubborn facts. I am constrained to show that our wheat-producing soil is totally unequal to the strain put upon it. After wearying you with a survey of the universal dearth to be expected, I hope to point a way out of the colossal dilemma. It is the chemist who must come to the rescue of the threatened communities. It is through the laboratory that starvation may be ultimately turned into plenty. The food supply of the kingdom is of peculiar interest to this meeting, considering that the grain trade has always been, and still is, an important feature in the imports of Bistol. The imports of grain to this city amount to about 25,000,000 bushels per annum—8,000,000 of which consist of wheat. The consumption of wheat per head of the population (unit consumption) is over six bushels per annum ; and taking the population at 40,000,000, we require no less than 240,000,000 bushels of wheat, increasing annually by 2,000,000 bushels, to supply the increase of population. Of the total amount of wheat consumed in the United Kingdom we grow 25 and import 75 per cent. It has been shown that at the best our stock of wheat and flour amounts only to 64,000,000 bushels—14 weeks' supply—while last April our stock was equal to 10,000,000 bushels, the smallest ever recorded by "Beerbohm" for the period of the same season. Similarly the stocks held in Europe, the United States, and Canada, called the "the world's visible supply," amounted to only 54,000,000 bushels, or 10,000,000 less than last year's sum total, and nearly 82,000,000 less than that of 1893 or 1894 at the corresponding period. To arrest this impending danger, it has been proposed that an amount of 64,000,000 bushels of wheat should be purchased by the State and stored in national granaries, not to be opened, except to remedy deterioration of grain, or in view of national disaster rendering starvation imminent. This 64,000,000 bushels would add another 14 weeks' life to our population. Assuming that the ordinary stock had not been drawn on, the wheat in the country would only then be enough to feed the population for 28 weeks. I do not venture to speak authoritatively on national granaries.

POSSIBILITIES OF HOME PRODUCTION OF WHEAT.

More hopeful, although difficult and costly, would be the alternative of growing most, if not all, our own wheat supply here at home in the British Isles. The average yield over the United Kingdom last year was 29.07 bushels per acre, the average for the last 11 years being 29.46. For 12 months we need 240,000,000 bushels of wheat, requiring about 8,250,000 acres of good wheat-growing land, or nearly 13,000 square miles, increasing at the rate of 100 square miles per annum, to render us self-supporting as to bread food. This area is about one-fourth the size of England. A total area of land in the United Kingdom equal to a plot 110 miles square, of quality and climate sufficient to grow wheat to the extent of 29 bushels per acre, does not seem a hopeless demand. It is doubtful, however, if this amount of land could be kept under wheat, and the necessary expense of high farming faced, except under the imperious pressure of impending starvation, or the stimulus of a national subsidy or permanent high prices. Certainly these 13,000 square miles would not be available under ordinary economic conditions, for much, perhaps all, the land now under barley and oats would not be suitable for wheat. In any case, owing to our cold, damp climate and capricious weather, the wheat crop is hazardous, and for the present our annual deficit of 180,000,000 bushels must be imported. A permanently higher price for wheat is, I fear, a calamity that ere long must be faced. At enhanced prices, land now under wheat will be better farmed, and therefore will yield better, thus giving increased production without increased area. The burning question of to-day is, What can the United Kingdom do to be reasonably safe from starvation in presence of two successive failures of the world's wheat harvest, or against a hostile combination of European nations? We eagerly spend millions to protect our coasts and commerce, and millions more on ships, explosives, guns, and men ; but we omit to take necessary precautions to supply ourselves with the very first and supremely important munition of war—food.

Since 1871 unit consumption of wheat, including seed, has slowly increased in the United Kingdom to the present amount of six bushels per head per annum ; while the rate of consumption for seed and food by the whole world of bread-eaters was 4·15 bushels per unit per annum for the eight years ending 1878, and at the present time is 4·5 bushels. Under present conditions of low acre yield, wheat cannot long retain its dominant position among the food-stuffs of the civilised world. The details of the impending catastrophe no one can predict, but its general direction is obvious enough. Should all the wheat-growing countries add to their area to the utmost capacity, on the most careful calculation the yield would give us only an addition of some 100,000,000 acres, supplying at the average world-yield of 12·7 bushels to the acre, 1,270,000,000 bushels, just enough to supply the increase of population among bread-eaters till the year 1931. At the present time there exists a deficit in the wheat area of 31,000 square miles—a deficit masked by the fact that the ten world crops of wheat harvested in the ten years ending 1896 were more than 5 per cent. above the average of the previous 26 years. When provision shall have been made, if possible, to feed 230,000,000 units likely to be added to the bread-eating populations by 1931—by the complete occupancy of the arable areas of the temperate zone now partially occupied—where can be grown the additional 330,000,000 bushels of wheat required ten years later by a hungry world? If bread fails—not only us, but all the bread-eaters of the world—what are we to do? We are born wheat-eaters. Other races, vastly superior to us in numbers, but differing widely in material and intellectual progress, are eaters of Indian corn, rice, millet, and other grains ; but none of these grains have the food value, the concentrated health-sustaining power of wheat, and it is on this account that the accumulated experience of civilised mankind has set wheat apart as the fit and proper food for the development of muscle and brains. Cheap production of wheat depends on a variety of causes, varying greatly in different countries. Taking the cost of producing a given quantity of wheat in the United Kingdom at 100s., the cost for the same amount in the United States is 67s., in India 66s., and in Russia 54s. We require cheap labour, fertile soil, easy transportation to market, low taxation and rent, and no export or import duties. Labour will rise in price, and fertility diminish as the requisite manurial constituents in the virgin soil become exhausted. Facility of transportation to market will be aided by railways, but these are slow and costly to construct, and it will not pay to carry wheat by rail beyond a certain distance. These considerations show that the price of wheat tends to increase. On the other hand, the artificial impediments of taxation and customs duties tend to diminish as demand increases and prices rise.

SALVATION BY CHEMISTRY.

I have said that starvation may be averted through the laboratory. Before we are in the grip of actual dearth the chemist will step in and postpone the day of famine to so distant a period that we, and our sons and grandsons, may legitimately live without undue solicitude for the future. It is now recognised that all crops require what is called a "dominant" manure. Some need nitrogen, some potash, others phosphates. Wheat pre-eminently demands nitrogen, fixed in the form of ammonia or nitric acid. All other necessary constituents exist in the soil ; but nitrogen is mainly of atmospheric origin, and is rendered "fixed" by a slow and precarious process which requires a combination of rare meteorological and geographical conditions to enable it to advance at a sufficiently rapid rate to become of commercial importance. There are several sources of available nitrogen. The distillation of coal in the process of gas making yields a certain amount of its nitrogen in the form of ammonia ; and this product, as sulphate of ammonia, is a substance of considerable commercial value to gas companies. But the quantity produced is comparatively small ; all Europe does not yield more than 400,000 annual tons, and in view of the unlimited nitrogen required to substantially increase the world's wheat crop, this slight amount of coal ammonia is not of much significance. For a long time guano has been one of the most important sources of nitrogenous manures, but guano deposits are so near exhaustion that they may be dismissed from consideration. Much has been said of late years and many hopes raised by the discovery of Hellriegel and Wolfarth, that leguminous plants bear on their roots nodosities abounding in bacteria endowed with the property of fixing atmospheric nitrogen ; and it is proposed that the necessary amount of nitrogen demanded by grain crops should be supplied to the soil by cropping it with clover and ploughing in the plant when its nitrogen assimilization is complete. But our present knowledge leads to the conclusion that the much more frequent growth of clover on the same land, even with successful microbe seeding and proper mineral supplies, would be attended with uncertainty and difficulties. The land soon becomes what is called "clover sick" and turns barren. There is still another and invaluable source of fixed nitrogen. I mean the treasure locked up in the sewage and drainage of our towns. Individually the amount so lost is trifling, but multiply the loss by the number of inhabitants, and we have the startling fact that in the United Kingdom we are content to hurry down our drains and water courses, into the sea, fixed nitrogen to the value of no less than £16,000,000 per annum. This unspeakable waste continues, and no effective and universal method is yet contrived of converting sewage into corn. Of this barbaric waste of manurial constituents Liebig, nearly half a century ago, wrote in these prophetic words : "Nothing will more certainly consummate the ruin of England than a scarcity of fertilizers—it means a scarcity of food. It is impossible that such a sinful violation of the divine laws of Nature should for ever remain unpunished ; and the time will probably come for England sooner than for any other country, when, with all her wealth in gold, iron, and coal, she will be unable to buy one-thousandth part of the food which she has, during hundreds of years, thrown recklessly away." The more widely this wasteful system is extended, recklessly returning to the sea what we have taken from the land, the more surely and quickly will the finite stocks of nitrogen locked up in the soils of the world become exhausted. The store of nitrogen in the atmosphere is practically unlimited, but it is fixed and rendered assimilable by plants only by cosmic processes of extreme slowness. The nitrogen that with a light heart we liberate in a battleship broadside has taken millions of minute organisms patiently working for centuries to win from the atmosphere.

The only available compound containing sufficient fixed nitrogen to be used on a world-wide scale as a nitrogenous manure is nitrate of soda, or Chile saltpetre. This substance occurs native over a narrow band of the plain of Tumarugal, in the northern provinces of Chile between the Andes and the coast hills. In this rainless district for countless ages the continuous fixation of atmospheric nitrogen by the soil, its conversion into nitrate by the slow transformation of billions of nitrifying organisms, its combination with soda, and the crystallization of the nitrate have been steadily proceeding, until the nitrate fields of Chile have become of vast commercial importance, and promise to be of inestimably greater value in the future. The growing exports of nitrate from Chile at present amount to about 1,200,000 tons. The present acreage devoted to the world's growth of wheat is about 163,000,000 acres. At the average of 12·7 bushels per acre this gives 2,070,000,000 bushels. But thirty years hence the demand will be 3,260,000,000 bushels, and there will be difficulty in finding the necessary acreage on which to grow the additional amount required. By increasing the present yield per acre from 12·7 to 20 bushels we should with our present acreage secure a crop of the requisite amount. Now from 12·7 to 20 bushels per acre is a moderate increase of productiveness, and there is no doubt that a dressing with nitrate of soda will give this increase and more. The action of nitrate of soda in improving the yield of wheat has been studied practically by Sir John Lawes and Sir Henry Gilbert on their experimental field at Rothamstead. This field was sown with wheat for thirteen consecutive years without manure, and yielded an average of 11·9 bushels to the acre. For the next thirteen years it was sown with wheat, and dressed with 5 cwt. of nitrate of soda per acre, other mineral constituents also being present. The average yield for these years was 36·4 bushels per acre—an increase of 24·5 bushels. In other words, 22·86 lb. of nitrate of soda produced an increase of one bushel of wheat. At this rate, to increase the world's crop of wheat by 7·3 bushels, about 1½ cwt. of nitrate of soda must annually be applied to each acre. The amount required to raise the world's crop on 163,000,000 acres from the present supply of 2,070,000,000 bushels to the required 3,260,000,000 bushels will be 12 million tons distributed in varying amounts over the wheat-growing countries of the world. It is difficult to get trustworthy estimates of the amount of nitrate surviving in the nitre beds. Common rumour declares the supply to be inexhaustible, but cautious local authorities state that at the present rate of export, of over one million tons per annum, the raw material "caliche," containing from 25 to 50 per cent. nitrate, will be exhausted in from 20 to 30 years. Dr. Newton, who has spent years on the nitrate fields, tells me there is a lower class material, containing a small proportion of nitrate, which cannot at present be used, but which may ultimately be manufactured at a profit.

Apart from a few of the more scientific manufacturers, no one is sanguine enough to think this debateable material will ever be worth working. If we assume a liberal estimate for nitrate obtained from the lower grade deposit, and say that it will equal in quantity that from the richer quality, the supply may last, possibly, fifty years, at the rate of a million tons a year; but at the rate required to augment the world's supply of wheat to the point demanded thirty years hence, it will not last more than four years. For years past we have been spending fixed nitrogen at a culpably extravagant rate, heedless of the fact that it is fixed with extreme slowness and difficulty, while its liberation in the free state takes place always with rapidity and sometimes with explosive violence. There is a gleam of light amid this darkness of despondency. In its free state nitrogen is one of the most abundant and pervading bodies on the face of the earth. Every square yard of the earth's surface has nitrogen gas pressing down on it to the extent of about seven tons—but this is in the free state, and wheat demands it fixed. To convey this idea in an object lesson, I may tell you that, previous to its destruction by fire, Colston Hall, measuring 146 ft. by 80 ft. by 70 ft., contained 27 tons weight of nitrogen in its atmosphere; it also contained one-third of a ton of argon. In the free gaseous state this nitrogen is worthless; combined in the form of nitrate of soda it would be worth about £2,000. For years past attempts have been made to effect the fixation of atmospheric nitrogen, and some of the processes have met with sufficient partial success to warrant experimentalists in pushing their trials still further; but I think I am right in saying that no process has yet been brought to the notice of scientific or commercial men which can be considered successful either as regards cost or yield of product.

Fixation of Atmospheric Nitrogen.

The fixation of atmospheric nitrogen, therefore, is one of the great discoveries awaiting the ingenuity of chemists. The fixation of nitrogen is vital to the progress of civilised humanity. Other discoveries minister to our increased intellectual comfort, luxury, or convenience; they serve to make life easier, to hasten the acquisition of wealth, or to save time, health, or worry. The fixation of nitrogen is a question of the not far distant future. Let me see if it is not possible even now to solve the momentous problem. As far back as 1892 I exhibited at one of the *soirées* of the Royal Society, an experiment on "The Flame of Burning Nitrogen." I showed that nitrogen is a combustible gas, and the reason why when once ignited the flame does not spread through the atmosphere and deluge the world in a sea of nitric acid is that its igniting point is higher than the temperature of its flame—not, therefore, hot enough to set fire to the adjacent mixture. But by passing a strong induction current between terminals the air takes fire and continues to burn with a powerful flame, producing nitrous and nitric acid. This inconsiderable experiment may not unlikely lead to the development of a mighty industry, destined to solve the great food problem. With the object of burning out nitrogen from air so as to leave argon behind, Lord Rayleigh fitted up apparatus for performing the operation on a larger scale, and succeeded in effecting the union of 29·4 grammes of mixed nitrogen and oxygen at an expenditure of one horse-power. Following these figures it would require one Board of Trade unit to form 74 grammes of nitrate of soda, and therefore 14,000 units to form one ton. To generate electricity in the ordinary way with steam engines and dynamos, it is now possible with a steady load night and day, and engines working at a maximum efficiency, to produce current at a cost of one-third of a penny per Board of Trade unit. At this rate one ton of nitrate of soda would cost £26. But electricity from coal and steam engines is too costly for large industrial purposes; at Niagara, where water power is used, electricity can be sold at a profit for one-seventeenth of a penny per Board of Trade unit. At this rate nitrate of soda would not cost more than £5 per ton. But nitrate of soda is limited in quantity, and will soon be exhausted.

Human ingenuity can contend even with these apparently hopeless difficulties. Nitrate can be produced artificially by the combustion of the atmosphere. Here we come to finality in one direction; our stores are inexhaustible. But how about electricity? Can we generate enough energy to produce 12,000,000 tons of nitrate of soda annually? A preliminary calculation shows that there need be no fear on that score; Niagara alone is capable of supplying the required electric energy without much lessening its mighty flow. The future can take care of itself. The artificial production of nitrate is clearly within view, and by its aid the land devoted to wheat can be brought up to the 30 bushels per acre standard. In days to come, when the demand may again overtake supply, we may safely leave our successors to grapple with the tremendous food problem. And in the next generation, instead of trusting mainly to foodstuffs which flourish in temperate climates, we probably shall trust more and more to the exuberant foodstuffs of the tropics, where, instead of one yearly sober harvest, jeopardised by any shrinkage of the scanty days of summer weather, or of the few steady inches of rainfall, Nature annually supplies heat and water enough to ripen two or three successive crops of foodstuffs in extraordinary abundance. To mention one plant alone, Humboldt—from what precise statistics I know not—computed that, acre for acre, the food-productiveness of the banana is 133 times that of wheat—the unripe banana, before its starch is converted into sugar, is said to make excellent bread. Considerations like these must, in the end, determine the range and avenues of commerce, perhaps the fate of continents. We must develop and guide Nature's latent energies, we must utilise her inmost workshops, we must call into commercial existence Central Africa and Brazil to redress the balance of Odessa and Chicago.

THE WEATHER DURING THE WEEK ENDING SEPTEMBER 10, 1898.

Stations.	Temperature of the Air.				Rainfall.	
	Highest.	Lowest.	Mean.			
	Fahrenheit.		Fahrenheit.	Centigrade.	In Inches.	In Centimetres.
[illegible]	92·1	56·1	70·4	21·33	0·00	0·00

The mean reading of the Barometer during the week at Greenwich was 29·95 inches, and that of the Thermometer 70°·4, the latter being 11°·5 above the week's average in the 50 years [illegible]. The direction of the wind was variable, the horizontal movement of the air being [illegible], below the week's average in the 16 years 1860–75. The duration of registered bright [illegible] in the week was 59·7 hours. No rain was measured during the week.

Distillation of Lavender is an important industry in some of the Alpine [illegible] of France. This season's distillation has just been completed, and is described as highly satisfactory, the yield of essential oil being abundant and good.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

The leading horticultural society of Scotland held its annual display of flowers, fruits, and vegetables in the Waverley Market, Edinburgh, on September 14 and 15, and the opinion of those fully competent to judge was that on no previous occasion had there been a better show, either as regards quality or quantity of exhibits. It certainly was an exceedingly fine display, and one worthy of the Royal Caledonian Society. The arrangements throughout were of the best, so far as the council and the energetic and genial secretary, Mr. P. Murray Thomson, are concerned, but it seemed to us that not a few of the exhibitors have yet to learn that a horticultural society is not wholly and solely a money-making concern, but is, if it fulfils its highest duty, an educational medium. If exhibitors fail largely to label their exhibits, then one of the chief educational features is lost. So far as fruit is concerned we have nothing to complain about in the labelling, but we refer more particularly to the plants and cut flowers; the nurserymen naturally understand the value of labelling their goods. The number of entries on this occasion fell short of last year by about a hundred and fifty, but as so very few were unfulfilled the show was really larger than usual, and more tabling and staging space was occupied than ever before. To those fond of statistics, we may state that there were 2 dessert tables, 11 collections of fruit, 184 entries of grapes, 135 of peaches, apricots, &c., 438 of apples, 129 of pears, 62 of small fruits, 212 of plants, 388 of cut flowers, 446 of vegetables, 9 of nurserymen's displays, and 120 of nurseymen's cut flowers; making, in the competitive classes, a grand total of 2,136 entries. The Caledonian Society is doing a great work, and each year sees its exhibitions improving and the attendance increasing, as the merits of the displays deserve. It has a magnificent exhibition hall in the Waverley Market, and if a few groups of the Cypher-cum-Shrewsbury class could be introduced there would be room for the display of more artistic ability than there is now, and the show would be improved thereby from a spectacular and other points of view. Among those who particularly associate themselves with these fine Edinburgh shows we cannot help but mention Messrs. D. P. Laird, J. Methven and Malcolm Dunn.

Groups and Plants.

There were several competitors in the class for a table of plants arranged for effect on a space of twelve feet diameter, and here the first prize was won by Mr. G. Wood, gardener to J. Buchanan, Esq., Oswald Road, Edinburgh, who made about as effective a display as is possible on such a table. He had crotons, cocos palms, and Lilium speciosum in variety, with long arching spikes of Oncidium incurvum for his tallest examples; and under these was a good assortment of stove plants of various kinds, with nerines, pancratiums, cypripediums, Begonia Glorie de Lorraine, Clerodendron fallax, and some anthuriums and streptocarpus dotted here and there. Ferns, asparagus, pannicum, and Ficus repens provided the necessary finish and drapery for the margin. Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Darlington, second, using large crotons, palms, and lilies; Mr. J. Cocker, gardener to J. Clayton, Esq., Himshaugh, third.

There was a very keen competition in the class for six table plants, the whole class producing an excellent display; Mr. J. McIntyre was a good first with pairs of crotons, aralias and dracænas, Dracæna D. P. Laird being very fine in colour and shape; Mr. D. Mackay, gardener to A. Hope, Esq., Kingston Grange, Liberton, second, and Mr. E. Palmer, gardener to Miss Moir, Alloa, third. The best half dozen ferns in forty-eight sized pots, suitable for table decoration, were those grown and staged by Mr. T. Lunt, gardener to A. Stirling, Esq., Keir Gardens, Dumblane; the second award was secured by Mr. J. Pearson, gardener to Lady Lucy Dandus, Birchwood, Murrayfield; Mr. J. Mitchell, gardener to J. Wilson, Esq., Falkirk, third; adiantums, gymnogrammas, nephrolepis, and pteris were chiefly shown. Mr. J. Crocker, The Chesters Gardens, Himshaugh, secured first prize for four exotic ferns with well-grown specimens, each about five feet across, of Davallia Mooreana, D. fijiensis plumosa, Microlepia hirta cristata, and Gymnogramma decomposita; Mr. J. H. Pearson, gardener to P. N. Fraser, Esq., Murrayfield, came second, his set containing large examples of Davallia polyantha. and Goniophlebium subauriculatum; Mr. G. Wood, third. The best four adiantums were shown by Mr. J. H. Pearson, who had very fresh and clean specimens of A. Williamsi, A. concinnum Flemingi, and A. digitatum; Mr. J. Crocker was a close second, while Mr. Pearson came third. Mr. J. McIntyre showed the best pair of gleichenias, staging a large example of G. Mendeli.

The best four orchids were exhibited by Mr. F. Nicol, Perth, his plants being neat specimens of Cattleya Dowiana aurea, Odontoglossum crispum, O. Harryanum, and Oncidium incurvum; Mr. W. Sharp, gardener to C. L. Wood, Esq., Freeland, Forgandenny, second, showing Vanda teres, Odontoglossum grande, O. Pescatorei, and Cattleya gigas. Mr. J. Mitchell, gardener to J. Wilson, Esq., Bantaskine, Falkirk, was easily first for three cypripediums, C. Dayana, C. Harrisianum, being very good; Mr. Sharp came second with C. Curtisi, C. Harrisianum superbum and C. Chamberlainianum; Mr. G. Wood, third, his C. Charlesworthi being a good variety. Mr. Sharp was a good first for one orchid with a large and well-grown Odontoglossum Pescatorei, an unspotted form with nine spikes; Mr. Mitchell, second; and Mr. Nicol, third.

Ornamental-leaved Plants.

Mr. T. Lunt was the chief prizewinner in the class for six foliage plants, his principal examples being the now little seen Campylobotrys refulgens, Alocasia metallica, and Anthurium Warocqueanum; not a single plant was labelled, and such an old and accomplished exhibitor as Mr. Lunt should not be a sinner in this respect, as it leads lesser lights to failure in the same way, and very materially reduces the value of an exhibition; Mr. W. Stewart, gardener to Sir Wilfred Lawson, M.P., Brayton Hall, Carlisle, came second. He had the usual wooden tallies inserted in the pots, but not accessible to the general public. Mr. Lunt led for six foliage plants in a class for larger specimens than the former, showing a large Campylobotrys refulgens, Heliconia illustris, Anthurium Warocqueanum, a croton, a dracæna, and Asparagus plumosus, not one of them being labelled; Mr. J. McCartney, gardener to Mrs. Croall, Southfield, Liberton, second; and Mr. D. Mackay, Kingston Grange, Liberton, third. Mr. Lunt scored for a pair of crotons with huge and well-coloured bushes; Mr. J. McCartney, Liberton, second; and Mr. J. McIntyre, third. Mr. J. McIntyre led for a specimen Eucharis amazonica, a well-flowered plant. For six selaginellas, Mr. G. Chaplin, gardener to Mrs. F. Nelson, St. Leonards, was a good first with flat specimens, most of which were not over pretty, though remarkably well grown; Mr. T. Gibb, second. For a pair of dracænas, Mr. Lunt was first with what appeared to be D. Cooperi and D. Gladstonei; Mr. M. McIntyre, gardener to Sir C. Tennant, Bart., Innerleithen, second. Mr. G. Wood had the finest caladiums, large specimens, and he was also first for a pair of coleus, with handsomely-coloured pyramids, but was bracketed with Mr. D. Mackay for the premier honours. The best specimen stove or greenhouse plant in flower was Stephanotis floribunda, from Mr. T. Lunt; Mr. McKenna, second, with a fine statice.

SOFT-WOODED PLANTS.

Fuchsias were good on the whole, Mr. J. Cumming, gardener to J. Wilson, Esq., Green Park, Liberton, leading for a pair of plants, closely followed by Mr. T. Gibb, gardener to Mrs. Edmonstone, both showing handsome pyramids. Mr. Cumming also led for three fuchsias, Mr. A. Thomson, St. Helen's, Eskbank, coming second. Mr. J. Pearson was to the fore for half a dozen chrysanthemums; Mr. D. Mackay second; and Mr. S. Abbott, Prestonfield House, Edinburgh, third; all were freely-flowered specimens of early flowering varieties. Vallota purpurea is very popular here, and the class for two specimens brought out a large competition, in which Mr. J. Shiel, gardener to Dr. W. W. Ireland, Maris Bush, Polton, led the way with a pair of first-rate specimens; Mr. W. Aitken, Balerno, second. For a single specimen of Valotta purpurea Mr. Thomas Gibb was first, and Mr. Aitken second. Mr. W. Anderson, gardener to Colonel Sir David Davidson, K.C.B., Colinton Road, Edinburgh, scored for four British ferns with well-developed specimens of Scolopendrium vulgare crispum, Athyrium f.-f. Craigi, Polystichum angulare grandiceps, and Lastrea felix-mas grandiceps; Mr. J. H. Peason second; and Mr. W. Muir, Carluke, third. For dwarf British ferns, Mr. Anderson was again first with pretty little plants of Polypodium trichomanes, P. cristatum, P. cornubiense, Asplenium marinum, A. microdon, A. trichomanes incisum, A. fontanum, Scolopendrium v. Baxteri, and Adiantum capillus veneris; Mr. J. H. Pearson second.

Some handsomely flowered and sturdily grown tuberous begonias secured for Mr. W. Galloway, gardener to J. H. Ford, Liberton, the chief award for six specimens; Mr. Mackay had the best single specimen; and Mr. Galloway led for double begonias, and with a specimen double begonia. Mr. G. McKenna, gardener to W. J. Usher, Esq., Ratha, had the best three zonal pelargoniums, freely flowered, flatly trained specimens; Mr. McKenna was also first for show pelargoniums; while Mr. Mackay scored for bronze foliaged varieties; and Mr. W. Anderson for silver variegated forms. Liliums were good, and made a splendid show, Mr. Bald winning with a fine specimen of L. speciosum, and also for L. auratum. Mr. McGregor, Dunfermline, had the best cockscombs; and Mr. McKenna the best petunias.

CUT FLOWERS.

For so late in the season roses were very good in the nurserymen's classes. Messrs. J. Cocker and Sons, Aberdeen, had the best dozen of one variety in this division, with Caroline Testout; Messrs. D. and W. Croll, Dundee, second, with the same; the Messrs Croll scored for a dozen blooms of La France; with Messrs. J. Cocker and Sons second. For a dozen blooms of Mrs. J. Laing, Messrs. D. and W. Croll, second. For a dozen blooms of any variety the Messrs. Croll took the lead with A. K. Williams; Messrs. Adam and Craigmile, Aberdeen, second, with Madame Hoste. Messrs. D. and W. Croll showed the best twelve examples of Merveille de Lyon; Messrs. Adam and Craigmile first for any other white with The Bride. Mr. H. Dickson, Belfast, won chief honours for a dozen roses with fair flowers of Her Majesty, Duke of Edinburgh, Mrs. J. Laing, Star of Waltham, and Madame J. Bonnaire; Messrs. D. and W. Croll, second. For two dozen tea roses Messrs. Adam and Craigmile led, followed by the Dundee firm, Messrs. J. Cocker and Sons scored for Alfred Colomb. The best three dozen roses came from Messrs. J. Cocker and Sons, Aberdeen, and were very fine and fresh; Caroline Testout, Lady M. Fitzwilliam, Madame Eugene Verdier, S. M. Rodocanachi, Captain Hayward, Marie Verdier, and Danmark were the best. For eighteen roses Mr. Hugh Dickson, Belfast, was first, and Messrs. D. and W. Croll second.

In the amateurs' classes, Mr. W. Parlane, Rosslea Row, had the best two dozen roses and the best six blooms of Alfred Colomb; Mr. W. Armstrong, Musselburgh, led for tea roses; Mr. Parlane led in several other rose classes, but the blooms on the whole were poor. Chrysanthemums arranged in large triangular sprays are inelegant, but in the class for a dozen sprays Mr. G. Manson, gardener to W. Pattison, Esq., Bathgate, was easily first. For six bunches of herbaceous flowers Mr. Brydon, Innerleithen, was first, his Lobelia cardinalis and Anemone japonica being very fine. Mr. Anderson, Morningside, was first for a dozen picotees, and for the same number of carnation blooms. Mr. Brydon scored for two dozen chrysanthemum blooms, showing Madame Desgrange varieties and early Japanese blooms; Mr. W. Black, gardener to P. Pringle, Esq., Hawick, had much the best chrysanthemum-flowered asters, a splendidly grown lot. For quilled asters Mr. R. Brown, of Eskbank, was first, but zonal pelargoniums were best shown by Mr. Bennett, Tweedmouth, but the flowers were not gummed, and lasted but a little while. Mr. G. W. Rilley, Galashiels, scored a first for annuals with a very bright display, but his bunches were too tight and formal. Mr. A. Dickson, Glenormiston, had the best button-hole bouquets; Mr. Hunt the best shower bouquet; Mr. Cossar the best shoulder spray, a fine one of Dendrobium Phalænopsis. Sweet peas were shown finely, Mr. J. Duncan, Duns, Berwick, winning with large blooms; Blanche Burpee, Maid of Honour, Prince Edward of York, and Salopean were first-rate; Mr. W. Wood, Kelso, second; and Mr. W. Angus, third.

COLLECTIONS OF FRUIT.

Fruit was splendid, and there were two charming exhibits put up in competition for the handsome prizes offered for the best and most tastefully decorated table of dessert fruit arranged on a table 10 feet long by 4 feet 6 inches wide. The following schedule specification will prove interesting to many readers and societies: The exhibitor must select sixteen "dishes" from the following twelve kinds of fruit, all other "kinds" of fruit being excluded. Of grapes, four dishes—of one bunch each, distinct varieties, two black and two white—may be staged on a table. Of other kinds of fruit, not more than two dishes, two distinct varieties can be staged. The number of fruit specified for "a dish" must be strictly adhered to, and neither more or less will be allowed.

Kinds of Fruit.	Number of Fruit in a Dish.	Kinds of Fruit.	Number of Fruit in a Dish.
Pineapple	1 Fruit.	Pears	6 Fruits.
Melon	1 do.	Apricots	9 do.
Grapes	1 Bunch.	Figs	9 do.
Apples	6 Fruits.	Plums	9 do.
Nectarines	6 do.	Cherries	40 do.
Peaches	6 do.	Strawberries	40 do.

Each dish must consist of one variety only, be neatly set up, as for a dessert, and correctly labelled. All fruit must be ripe, sound, and fit for immediate use. The society will provide a white table-cloth and sixteen dessert plates or dishes for each table, and no other plates or dishes can be used (except for grapes) for setting up the fruit. The grapes may be set up on neat stands or tripods, or suitable receptacles provided by the exhibitor; who can arrange cut flowers and foliage on the table cloth, or in glass epergnes or flower glasses provided by himself. All articles of plate, decanters, and wine glasses, and all plants in pots or other receptacles are strictly prohibited. The arrangement and decoration of each table must be done by the exhibitor or his regular assistant.

SPECIAL NOTICE.—The tables will be judged by points, as follows; Each dish of fruit—Pineapple may receive a maximum of 10 points; grapes, black or white, 9; melons, nectarines, and peaches, 8; apricots and figs, 7; all other fruits, 6; beauty of flowers and foliage, 10; harmony of colours, 10; and tasteful arrangement, 10. The number of points awarded to each item will be shown on a card on each prize-winning table.

Mr. R. Cairns, gardener to J. Martin White, Esq., Balruddery, won first prize, and his decoration consisted of Dendrobum Phalænopsis Shroderianum, Odontoglossum crispum, a few cattleya blooms, Gypsophila, and a few pink carnations; on the table were sprays of smilax, and long fronds of Selaginella Wildenovi. The best of the fruit consisted of pineapples, good Hero of Lockinge and Windsor Castle melons, Souvenir du Congrès pears, Royal George peaches, figs and nectarines; the grapes were not over good in most instances. Mr. A. Kirk, gardener to J. Thompson Paton, Esq., Norwood, Alloa, was placed second, and some little dissatisfaction was displayed at the award, many considering Mr. Kirk should have been first; he had splendid Gros Maroc, Appley Towers (grand), Muscat of Alexandria, and Duke of Buccleuch grapes, Admirable and Golden Eagle peaches, Souvenir du Congrès pears, Humboldt nectarines, black Jamaica pineapples, and Royal Jubilee melons. The following is the list of points:—

Mr. R. Cairn's pineapples, 8; melons, 5½; grapes, 6; apples, 5½; nectarines, 6; peaches, 5; figs, 4½; beauty of flowers and foliage, 8½; harmony of colours, 8½; tasteful arrangement, 8½; total, 66. Mr. Kirk: pineapples, 6; melon, 5½; grapes, 8; apples, 4½; nectarines, 6; peaches, 7; pears, 4½; beauty of flowers and foliage, 7½; harmony of colours, 7½; tasteful arrangement, 7½; total, 64.

Mr. R. Cairns, gardener to J. M. White, Esq., Balruddery, secured the leading award for ten dishes of fruit, showing Muscat of Alexandria and Black Alicante grapes, Moorpark apricots, Brown Turkey figs, Mère de Menage apples, Royal George peaches, Pine Apple nectarines, very fine; Souvenir du Congrès pears, a melon, and a Smooth Cayenne pine; Mr. W. Smith, gardener to the Earl of Stair, Oxenford Castle, second, with a good collection. For hardy fruits, twelve dishes, Mr. J. Day, gardener to the Earl of Galloway, K.T., Garliestown, led the way with Worcester Pearmain and Lady Sudeley apples, Williams' Bon Chretien and Souvenir du Congrès pears, Lord Napier and Pitmaston Orange nectarines, Castle Kennedy figs, Pond's Seedling and Kirk's plums, Princess of Wales and Grosse Mignonne peaches, and Morello cherries; Mr. J. Nicholson, gardener to J. W. Melles, Esq., Essex, second; and Mr. W. Williamson, Cupar, third.

There were three good collections of a dozen dishes of orchard house fruit, but the set staged by Mr. J. Beisant, gardener to Mrs. Armitstead, Castle Huntly, Longforgan, was much the best, and was composed of Peasgood's Nonsuch and Emperor Alexander apples, Marguerite Marillat and Souvenir du Congrès pears, Gladstone and Princess of Wales peaches, Spencer and Pine Apple nectarines Magnum Bonum and Rivers' Monarch plums, Brown Turkey figs, and Moorpark apricots, a grand lot of fruit; Mr. R. Cairns, gardener to J. M. White, Esq., Balruddery, second; and Mr. W. Williamson, gardener to J. Home Rigg, Esq., Tarvit, Cupar, Fife, third.

GRAPES.

Mr. Thomas Lunt, Keir Gardens, led the way for six bunches of grapes out of eight competitors, with a superb set of heavy well coloured and finely berried bunches of Muscat of Alexandria, Black Hamburgh, and Alnswick Seedling; Black Hamburgh was very fine; Mr. W. Rutherford, gardener to D. Graham, Esq., Bridge of Allan, second, with huge clusters of Muscat Hamburgh, Mrs. Pince, and Black Hamburgh; Mr. J. Beisant, third. Nine competed in the class for four bunches of grapes, and the most successful competitor was the firm of Messrs. W. Murray and Son, Park Hall Orchard, Polmont, who had good clusters of Black Hamburgh, Alicante, and Madresfield Court; Mr. T. Lunt, second; and Messrs. D. and W. Buchanan, Kippen, third. In the class for a bunch of black grapes showing the finest bloom Messrs. W. Murray and Son scored with Cooper's Black; Mr. Lunt, second, with Gros Maroc; and Mr. Leslie, Perth, third, with Gros Colmar.

Mr. T. Lunt showed the best flavoured white grapes, a bunch of Muscat of Alexandria; Mr. Beisant, second; and Mr. Rutherford, third, with the same variety. The best flavoured black grape was Madresfield Court, shown by Mr. W. J. Green, gardener to Sir C. M. Palmer, Bart., M.P.; Messrs. W. Murray and Son, second, with the same variety. Mr. Williamson scored for an unnamed white grape with a round-berried variety; and for a single bunch of any black grape Mr. J. Paterson, gardener to D. Beatson, Esq., Kirkcaldy, led the way in a very keen competition with Cooper's Black, a large bunch of large berries. Mr. R. Hunt, Murrayfield, led for Lady Downes; Mr. J. Paterson for Gros Colmar, with plum-like berries; Messrs. D. and W. Buchanan for Alnwick Seedling; Messrs. W. Murray and Son for Black Alicante, with Mr. A. Hutton a close second; Mr. J. Menzies, gardener to J. A. Harvie Brown, Esq., Larbert, first for Black Hamburgh, and Mr. Lunt for Muscat of Alexandria—all the foregoing were single-bunch classes. Mr. Menzies led for two bunches of Black Hamburgh grapes, with Messrs. W. Murray and Son second. For two bunches of Muscat of Alexandria, Mr. Thomas Lunt was a good first with long, shapely, fine-coloured and large-berried bunches; Mr. D. Kidd, gardener to Lord Elphinstone, Musselburgh, second; and Messrs. D. and W. Buchanan, Forth Vineyard, Kippen, third.

MELONS, PEACHES, &C.

Hero of Lockinge was the best green-fleshed melon, and was staged by Mr. W. R. Whitecross, gardener to G. Willsher, Esq., Auchterhouse; for a scarlet-fleshed melon, Mr. W. Kidd scored. Mr. J. Billton, gardener to Major Balfour, Fernie Castle, Fife, had the best dish of figs, scoring with Brown Turkey; Mr. M. McIntyre, second. For a dozen peaches, Mr. Lunt asserted his superiority as a cultivator, with fine fruits of Sea Eagle; Mr. J. Beisant, second, with Princess of Wales; and Mr. A. Hutton, Montrose, third. For twelve nectarines, Mr. W. Smith, Oxenford Castle, led with highly-coloured fruits of Humboldt; with Mr. W. Williamson, second. Mr. J. Cossar, of Dunbar, showed the best apricots; Mr. Smith, the best plums—Transparent Gage; Mr. J. J. Wann, gardener to Lord Balfour of Burleigh, the best yellow plums; and Mr. J. Besant, the best red plums—Pond's Seedling. Mr. Williamson staged the best four dishes of dessert plums, with Mr. W. Laing, Willfield Gardens, Fife, second, the latter showing Kirk's, Denniston Gage, Jefferson's, and Green Gage, the former having an unnamed set. For four dishes of culinary plums, Mr. J. Day, Galloway House Gardens, was first, with fine fruits of Magnum Bonum, Victoria, Pond's Seedling, and Goliath; Mr. J. Cairns, gardener to the Earl of Home, Coldstream, second.

APPLES.

The class for twelves dishes of apples brought out a good competition, and Mr. J. F. McLeod, gardener to J. P. Morgan, Esq., Roehampton, won with American Mother, Adams' Pearmain, Worcester Pearmain, Emperor, Alexander, Barchard's Pippin, King of the Pippins, Bismarck, Ribston Pippin, Gloria Mundi, Tyler's Kernel, Flower of Kent, and Peasgood's Nonsuch; Mr. R. J. Hamill, gardener to F. S. Roberts, Esq., St. Saviour's, Jersey, second; and Mr. J. Cocker, third. For a collection of twelve varieties of apples grown in Scotland, four fruits of each, the chief award was won by Mr. J. Day, Galloway House Gardens, Garlieston, Wigton, with finely-developed specimens of Lady Sudeley, Cellini, Ravelston Pippin, Queen, Worcester Pearmain, Keswick Codlin, Mère de Menage, Warner's King, James Grieve, Peasgood's Nonsuch, Loddington, and one unnamed variety; there were nine competitors; Mr. M. Smith, Prestwick, second; and Mr. T. H. Cook, gardener to the Earl of Wemyss, Gosford, Longniddry, third. Mr. Day had also the best small collection of apples; Mr. D. Robb, Auchtermuchty, second.

SINGLE DISHES OF APPLES.

In the single dish classes for apples there was a wonderful competition. Mr. J. Morrison, Archerfield, led for Blenheim Pippin; Mr. M. Smith, for Court of Wick; Mr. Day, for Cox's Orange Pippin; Mr. Fowler, St. Boswell's, for Duke of Devonshire; Mr. J. Nicholson, for Gascoigne's Scarlet; Mr. A. Dickson, Glenormiston, for Irish Peach; Mr. J. Day, for James Grieve; Mr. W. Benvie, Errol, for Kerry Pippin; Mr. J. Fraser, Coldra, Monmouth, for King of the Pippins; Mr. D. Robb, for Lady Sudeley; Mr. J. Nicholson, for Mabbot's Pearmain; Mr. A. M. Clymont, Granton House, for Oslin Pippin; Mr. R. Hamill, for Ribston Pippin; Mr. J. Day, for Thorle Pippin; Mr. Hamill, for Worcester Pearmain; Mr. W. Harper, Perth, for Yellow Ingestrie; Mr. J. McKinlay, Inveresk Gate, for Alfriston; Mr. R. Hamill, for Beauty of Kent; Mr. J. F. McLeod, for Bismarck; Mr. W. Benvie, for Bramley's Seedling; Mr. J. Jeffrey, Harewood, Leeds, for Ecklinville; Mr. Hamill, for Emperor Alexander; Mr. Hamill, for Golden Noble; Mr. Williamson, for Lane's Prince Albert; Mr. M. Smith, for Keswick Codlin; Mr. A. McComb, Gorton, for Hawthornden; Mr. J. Nicholson, for Grenadier; Mr. J. Beisant, for Golden Spire; Mr. A. Lauder, Musselburgh, for Lord Suffield; Mr. Beisant, for Lord Grosvenor; Mr. J. Jeffrey, for Lord Derby; Mr. Beisant, for Loddington; Mr. Hamill, for Mère de Menage, for Northern Greening, and for Pott's Seedling; Mr. D. Carmichael, for The Queen; Mr. J. Paterson, for Tower of Glamis; Mr. J. Patterson, for Cox's Pomona; and Mr. Hamil, for Warner's King. The educational value of such classes as these is very great.

PEARS AND SMALL FRUITS.

In the pear classes Mr. Hamill led for a dozen varieties, with Louise Bonne of Jersey, Beurre Bosc, Emile d' Heyst, Belle de Jersey, Williams' Bon Chretien, Souvenir du Congres, General Todtleben, and Grosse Calebrasse; Mr. Nicholson, second; and Mr. J. F. McLeod, third. For six varieties, Mr. J. Day was first, showing fine examples of Gratioli of Jersey, Beurre de Capiaumont, Clapp's Favourite, William's, Duchess d'Angoulême, and Pitmaston Duchess; Mr. J. Cairns, second; and Mr. T. H. Cook, third. Mr. Hamill scored for Beurre Diel; Mr. Cook for Beurre Rance; Mr. Hamill for Beurre Superfin and Durondeau; Mr. Cook for Easter Beurre; Mr. Cook for Glou Morceau; and Mr. A. Shakelton, gardener to Captain the Hon. Cecil Duncombe, The Grange, Nawton, Yorks, first for Jargonelle. In other single dish classes Mr. Carmichael and Mr. Hamill were the leading prize-winners.

Some excellent gooseberries were staged by Mr. J. Laing, Blairgowrie; red currants from Mr. J. Cairns were splendid, so also were the white currants from Mr. D. Pitt, Kelso. Mr. Cairns scored for Morello cherries with huge fleshy fruits of great merit; Mr. Morrison, second.

NURSERYMEN'S EXHIBITS.

Messrs. R. P. Laird and Sons showed a useful lot of hardy evergreen shrubs, besides numerous hardy shrubs with golden and variegated foliage, gaining first prize for their two dozen plants. Messrs. J. Dickson and Sons, second. Lack of space forbids us particularising the kinds shown. Messrs. R. P. Laird and Sons scored for six palms, contributing among others a fine rhapis, seaforthias, and date palms. Mr. J. Downie, Beech Hill Nurseries, had the best dozen table plants in this division, and consisting of Crotan Chelsoni, C. Aigburth Gem, C. Golden Ring, C. elegantissima, Aralia gracillimum, A. Veitchi, Dracæna Godseffiana, D. Mrs. Laird, D. Princess May, Pandanus Veitchi, Cocos Weddelliana, and Geonoma gracilis; Messrs. R. P. Laird and Sons, Pinkhill, Murrayfield, second. The best dozen conifers came from Messrs. R. P. Laird and Sons, and these helped to make a good ring of foliage round the bandstand; their specimens were Thuiopsis dolobrata variegata, Thuja orientalis aurea, S. occidentalis lutescens, Cupressus Lawsonianus cærulea compacta, a most distinct form, C. L. stricta alba, C. L. lutea, Retinospora plumosa aurea, R. pisifera aurea, Thuia occidentalis, Cupressus Lawsonianus albo pyramidalis, Retinospora squarrosa Veitchi, Thuia occidentallis ericoides, and Retinospora gracilis aurea; Messrs. Dickson and Sons, second.

For eighteen bunches of cactus dahlias Messrs. Laird and Sinclair were awarded first prize for a fresh lot that contained a good many varieties too nearly of the decorative type; Mr. M. Campbell, High Blantyre, second; and Mr. S. Mortimer, Farnham, third. For two dozen show dahlias Mr. M. Campbell was placed first, for a set of very large flowers; Mr. J. Smellie, Bushy, second. For fancy dahlias Mr. M. Campbell and Mr. Smellie again divided the honours. Messrs. R. P. Laird and Sons, had the best eighteen bunches of single dahlias, putting up a good set of the popular varieties. As usual, Mr. M. Campbell took leading honours for picotees. Messrs. Dickson and Sons had the best two dozen bunches of early chrysanthemums. Messrs. J. Cocker and Sons, Aberdeen, had by far the best table of hardy flowers, putting up large and beautiful bunches of gaillardias, liliums, delphiniums, montbretias, &c.; Messrs. Harkness and Sons, second; and Mr. W. Gunn, Olton, third. Mr. James Forbes, Hawick, secured the chief award for eleven spikes of hollyhocks, with beautiful spikes of shapely flowers. For thirty gladiolus spikes Messrs. Harkness and Sons, Bedale, Yorks, won with splendid blooms and spikes; Mr. N. Walker, Gateshead-on-Tyne, second.

VEGETABLES.

Throughout the display vegetables were good, though too large in some instances. The finest collection of ten varieties of vegetables came from Mr. J. Waldie, gardener to W. H. Dobie, Esq., Dollar, who had lovely Grove White celery, International leeks, Lockie's Perfection cucumbers, Canadian Wonder beans, Duke of York potatos, Duke of Albany peas, Frogmore Prolific tomatos, Eclipse cauliflowers, Cranston's Excelsior onions, and St. Valery carrots; Mr. G. Ormiston, Jedburgh, second. Tomatos were splendid, and in dishes of a dozen fruits made a great show. Mr. W. Galloway, Liberton, was first prize-winner, with Mr. J. Graham, Wishaw, second. Peas and beans were good for the lot, but need not be particularised.

Onions were fine, and Mr. A. C. Cameron, gardener to W. Boase, Esq., Dundee, led with a dozen enormous bulbs; Mr. J. Orr, Drymen, second. Cabbage, cauliflowers, savoys, beet, carrots, parsley, turnips, &c., all represented high culture. Potatos were clean and good, Mr. Gemmell and Mr. Cossar being leading prize-winners. Mr. Waldie won easily for six heads of celery; and Mr. J. Ovens, Berwick, for parsnips, a good substantial set. Leeks were best shown by Mr. J. Hood, St. Boswell's, who had splendidly blanched stems of good substance; Mr. E. Joss, Milnathost, second.

NON-COMPETITIVE DISPLAYS.

The displays put up not for competition were very numerous and in great variety. The display of fruit and plants grown at the gardens of Her Majesty the Queen, Windsor, was, of course, the great attraction on this occasion, and the Council of the Royal Caledonian Horticultural Society took advantage of the promise that Mr. Owen Thomas would make a display, to advertise and boom Her Majesty's exhibit on the boldest of posters. It was a first-rate exhibit, and though it did not give a fair idea of the capacity of the Frogmore establishment, it served to illustrate the high cultivation that obtains there. Well-grown nepenthes were staged in three rows down a long table, and the most notable plants were Nepenthes mixta, N. Curtisi, N. sanguinea, N. Dicksoniana, N. Mastersi, Amesiana, N. Curtisi superba, and N. intermedia. Around the stems of the nepenthes stands sprays of asparagus were twined with the addition of long sprays of Vanda Lowei round the taller ones. In vases down the centre were bamboo sprays, asparagus, brilliant umbels of Hæmanthus multiflorus, anthurium spathes in a variety of colours, and a few spikes of Peristeria elata, from the plant referred to in a previous issue.

Under the plants and flowers was a groundwork of excellent culinary and dessert apples and pears, all well-developed specimens, comprising a large number of varieties. Bananas and pines crowned the centre, while baskets of grapes were placed at intervals all around the table. Melons were first-rate and showy. Around the whole table, near the margin, were dishes of choice plums, apricots, peaches, cherries, nectarines, figs, and other fruits in season that are to be expected from a large establishment.

Messrs. James Veitch and Sons, Chelsea, put up a beautiful circular group of plants, consisting almost entirely of foliage subjects: large palms, splendidly-pitchered nepenthes of sorts, tall specimens of the dark bronzy Dracæna Bartoni, and large leaved crotons such as C. Reidi, C. Flamingo, and C. Thompsoni, made up a tasteful centre, around which were grouped highly coloured caladiums, Phrynium variegatum, some choice bromeliads, dracænas, and an abundant variety of pretty little crotons, with here and there a tall plant of croton, Prince of Wales, raised well above the rest to display its drooping corkscrew foliage of deep yellow. Leea amabilis, Acalypha Sanderi, D. Goldieana, Yucca filamentosa aurea-variegata, bertolonias, sonerillas, and anæctochili, were all notable plants. Facing one way this firm had a few choice orchids in their group, Miltonia spectabilis Moreliana, Cattleya aurea, and Oncidium incurvum, figuring conspicuously; on the other side was a small bank of choice Javanico-multiflorum rhododendron hybrids. From Lewisham, Mr. H. J. Jones brought a pretty exhibit of tuberous begonias, both single and double varieties, and all lifted from the open ground for this occasion; caladiums and liliums made up the central mound, while the begonias were congregated at either end. Some handsome Cocos Weddelliana and Kentias were used to crown the several mounds of which the group was composed; ferns were freely used to give finish to the display, but the begonias were the chief attraction. A splendid exhibit came from Messrs. R. Wallace and Co., Colchester, who staged a wonderfully fresh collection of cut flowers, chiefly liliums, kniphofias, gladioli, and montbretias. Lilium speciosum, L. s. album-novum, L. splendens, L. Harrisi, L. auratum in variety, such as L.a. virginale, L.a. platyphyllum, &c. Some late spikes of Hemerocallis aurantiaca major attracted considerable attention, as also did the great variety of bright montbretias.

From Rothesay Messrs. Dobbie and Co. brought a splendidly fresh and beautiful exhibit of cactus and pompon dahlias; some of the pompon varieties seemed almost too robust, but the cactus varieties did not err on the side of hugeness but were charming flowers of a suitable and characteristic size; Arachne, Night, Matchless, Gloriosa, Fantasy, Royal George, Cinderella, Capstan, Cassilda, and Harry Stredwick were a few of the finest and most distinct forms from among four dozen bunches. A pretty lot of early-flowering chrysanthemums were arranged in front of the bunches of dahlias and these made a fine show; Grace Attick is a pretty narrow-petalled white variety of great value. The front of the exhibit consisted of specimen blooms of all the newer cactus dahlias and formed a good border to a good display. Mr. J. Forbes, Hawick, contributed a grand lot of hollyhocks, staging four and five feet spikes of handsome double flowers in a considerable variety of colours from white to pink and intense crimson and crimson-purple. Bunches of phloxes and herbaceous flowers of sorts made a bright bank before the hollyhocks, while lower still were such fine pentstemons as one expects from Hawick, together with carnations in variety, pansies, violas, dahlias, &c. Messrs. Dickson and Co., Waterloo Place, Edinburgh, showed a fine lot of pot vines, fruiting; they also staged zonal pelargoniums, sweet peas, violas, and pansies, making a great display.

Mr. J. Downie, Princes Street, had a large circular display of stove and greenhouse plants, the centre being composed of attractive liliums and cannas; lily of the valley and begonias, with crotons and palms, were used towards the margin, and with considerable effect. Messrs. T. Methven and Sons, had a big group of caladiums, crotons, dracænas, vallotas, Acalypha Sanderi, and other useful plants. Messrs. James Dickson and Sons sent from their Inverleith Nurseries a small and pretty group of clematises in small pots, encircled by a ring of euonymus. Messrs R. P. Laird and Sons had a fine circular exhibit of plants in great variety, all tastefully disposed; Acalypha Sanderi was conspicuous, so also were the large specimens of Lilium speciosum and Hydrangea paniculata. The Icthemic Guano Co. and Chemical Union, of Colchester, both made tasteful displays.

Messrs. W. Thomson and Sons, Clovenfords, showed baskets of first-rate grapes and tomatos, together with a tasteful display of plants. Messrs. Kerr Brothers, Dumfries, sent a showy group of dahlias and hardy flowers. Mr. M. Cuthbertson, Rothesay, displayed hardy flowers in great beauty and variety. Mr. M. Campbell, High Blantyre, put up an extensive exhibit of liliums, hardy flowers in variety, dahlias in abundance, and carnations and picotees. Messrs. A. Lister and Son, Rothesay, contributed dahlias and hardy flowers, also a pretty collection of violas and pansies. Messrs. J. Grieve and Sons, Redbraes, showed a collection of violas and pansies, marigolds, carnations, &c. Mr. J. Smellie, Busby, contributed a bright group of pompon, show, and cactus dahlias. Messrs. Stuart and Mein, Kelso, sent dahlias and herbaceous flowers. Messrs. D. and W. Buchanan, Kippen, showed vine and other foliage preserved by their patent foliage, so as to secure autumn tints; they also showed some good grapes and tomatos. Mr. C. Irvine, Jedburgh, N.B., exhibited a fine lot of pentstemons, liliums, and herbaceous flowers in variety.

"BY THE QUEEN'S COMMAND," I once performed at Windsor before Her Majesty and several members of the Royal Family; and, oh, it was the most delightful experience I have ever had." The speaker was an enthusiastic young actress, as popular as she is beautiful. "The honour was certainly a great one," we murmured. "Yes," she responded quickly, "but it was not only that; Her Majesty was so kind, you know. It really did you good, the way she treated you." That is just it. Proper treatment is all we want. Nine-tenths of the sickness we suffer might be cured if we only had proper treatment. If you are ill or fall out of sorts, seek relief from the true friends of the sick and suffering—Holloway's Pills and Ointment.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Planting and Protecting Tea Roses.—Safrano, Surrey: (1) To protect tea roses during winter it is a good plan to place around and up to the stem a cone of finely-sifted dry soil or coal ashes and also to place bracken in the head, twisting and tying it just sufficiently to prevent its being blown away; it is needless to thatch the bushes. (2) The manure should be dug in a few weeks before planting time. (3) Let the bedding plants run their course, then clear them out, manure the ground lightly, and deeply dig it; after planting the roses place a layer of manure on the surface of the bed. (4) Six good yellows are—Amazone, Caroline Kuster, Etoile de Lyon, Francisca Kruger, Madame Hoste, and Perle des Jardins.

Theory and Practice.—G. Y.: It is a mistake to say that a certain course of procedure is "all very well in theory but no use in practice," and this arises from a misapprehension as to the definition of theory and confusing it with mere book knowledge. Theory, briefly stated, is the science distinguished from the art, or the rules of an art as distinguished from the practice as the theory and practice of gardening. Again, a theory is founded on principles which have been established on independent evidence, and therefore if the theory cannot be satisfactorily demonstrated in practice it is nothing more than a hypothesis which merely assumes the operation of a cause that would account for the phenomena but has not evidence that such cause was actually at work. This being the case an acquaintance with the theory of horticulture is desirable to those engaged in gardening; but the knowledge of the art must be sufficient to admit of the knowledge so gained being put into practice. In all cases we strongly advise the teaching of the theory and practice of horticulture simultaneously.

Names of Plants.—X Y Z: 1, Lomaria discolor bipinnatifida; 2, Davallia tenuifolia Veitchiana; 3, Adiantum cyclosorum; 4, send when in fruit; 5, Asplenium obtusilobum; 6, Acrophorus chærophyllus.

F. K.: 1, Dichorisandra metallica picta-nigra; 2, Asparagus retrofractus arboreus; 3. Bignonia argyreo violascens; 4, Ipomæa Horsfalliæ.

S. M.: Your plant is Hoya campanulata.

W. H.: 1, Filicium decipiens; 2, Eranthemum sanguinolentum; 3, Columnea Kalbreyeriana.

T. W.: We have been compelled to discontinue the naming of florists' flowers, because of the great similarity which exists between so many varieties, and the consequent difficulty of distinguishing them from the flowers alone. Your phloxes reached us in an unsatisfactory condition, for the thin cardboard box was smashed in coming through the post, and, as the packing material was cotton-wool, the flowers were much shrivelled.

Amateur: Your plant is Helianthus rigidum Miss Mellish.

Names of Fruits.—H. M.: 1, Wormsley Pippin; 2, Oslim; 3, send a specimen when approaching maturity; 4, Red Astrachan.

K. B.: The figs are—1, Bourjassotte Grise; 2, Black Ischia; 3, Col di Signora Bianca. The pears are—1, Fondante d'Automne; [2, Summer Beurré d'Aremberg.

Practical Pomologist: 1, Bryanston Green Gage; 2, Decaisne; 3, Boulouf; 4, Coe's Late Red.

S. B.: 1, White Tokay; 2, Grizzly Frontignan; 3, Mrs. Pearson; 4, West's St. Peters; 5, Duchess of Buccleuch.

R. L., Hants: 1, Galopin; 2, Balgowan; 3, Lady Palmerston; 4, Belle Bauce; 5, so much damaged in transit as to be unrecognisable; 6, Golden Eagle.

W. S., Yorkshire: The pear is Marguerite Marrillat, and it is such an excellent variety for use early in September that we would advise you to add it to your collection.

MARKETS.

Covent Garden.

THERE is a moderate supply of fruit, with a steady demand at current rates. The supply of vegetables is an average one, and for the choice kinds there has been a brisk demand.

FRUIT.—English apples, 3s. to 9s. per bushel; English pears, 3s. to 6s. 6d. per bushel; French, 3s. to 7s. 6d. per case; greengages, 2s. 6d. to 5s. 6d.; Victoria plums, 2s. to 4s. 6d.; Orleans, 2s. to 3s. 6d.; damsons, 2s. to 3s. per half-sieve; English grapes, 10d. to 2s.; Jersey, 6d. to 1s.; Belgian, 5d. to 7d. per lb.; Denia, 4s. 6d. to 7s. 6d. per barrel; peaches, 1s. 6d. to 6s.; nectarines, 1s. 6d. to 8s.; green figs, 9d. to 1s. 3d.; English apricots, 9d. to 1s. 3d. per dozen; Spanish melons, 4s. 6d. to 7s. per case; English tomatos, 3d. to 4d.; Jersey, 2d. to 3d. per lb.; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 4s. each.

FLOWERS.—Arums, 3s. to 5s.; carnations, 1s. to 3s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 2s to 4s.; gardenias, 2s. to 3s.; Lilium Harrisi, 2s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. 6d. to 4s.; and tuberoses, 6d. to 1s. per dozen blooms; Adiantum cuneatum, 4s. to 5s.; asters, 2s. to 4s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; pelargoniums (scarlet), 3s. to 4s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 1s. 6d.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Cabbages, 2s. 6d. to 4s. 6d.; beetroots, 2s. to 2s. 6d.; vegetable marrows, 1s. 6d. to 2s. per tally; mushrooms, 8s. to 10s.; eschallots, 1s. to 2s.; garlic, 2s. 6d. to 3s. 6d. per 12 lb.; Valencia onions, 4s. 6d. to 6s.; Ports, 5s. to 6s. per case; endive, 1s. to 1s. 3d.; cauliflowers, 1s. to 2s. 6d.; cucumbers, 1s. 6d. to 3s. per dozen; lettuce, 2s. to 3s. per dozen; French beans, 3s. to 4s.; scarlet runners, 3s. to 5s. per bushel; turnips, 2s. 6d. to 3s. 6d.; carrots, 1s. to 2s.; parsley, 1s. 6d. to 2s. 6d.; mint, 1s. 6d. to 2s. per dozen bunches; potatos, 60s. to 90s. per ton.

Borough Potato Market.

Supplies are coming forward in largely increased quantities with the result of the values being lower. The quality of the majority of the samples is exceptionally high. Beauty of Hebron and Snowdrops, 3s. 9d. to 4s.; White Hebrons, Early Puritan, Sutton's Early Regents, Reading Giants, and Imperators, 3s. 6d.; Black Lands, 2s. 9d. to 3s. per cwt.

ENGAGEMENTS FOR THE ENSUING WEEK.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY, SEPTEMBER 19, 20, 21, 22, AND 23.—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

TUESDAY, SEPTEMBER 20.—Stove and Greenhouse Plants, Ferns, Palms, &c., Messrs. Protheroe and Morris, on the premises, The Holmesdale and Highfield Nurseries, Stevenage, Herts.

FRIDAY, SEPTEMBER 23.—Imported and Established Orchids, Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

MONDAY AND WEDNESDAY, SEPTEMBER 19 AND 21.—Dutch and French Bulbs, Mr. J. C. Stevens, King Street, Covent Garden.

THURSDAY, SEPTEMBER 22.—Importation of 2,000 plants of Brassavola Digbyana, Mr. J. C. Stevens, King Street, Covent Garden.

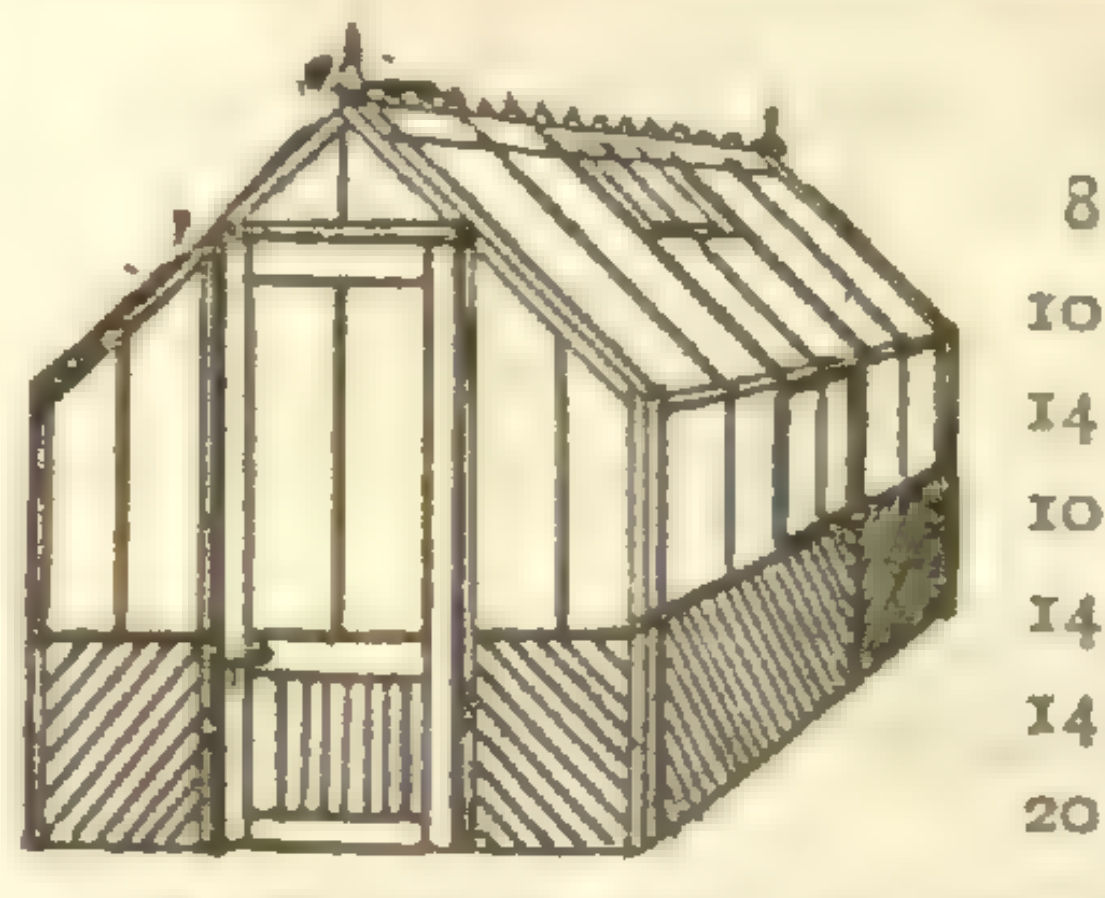
The paper is acknowledged by all to be one of the best mediums for this purpose. Prepaid terms: 32 words, One Shilling; three times for Two Shillings. Offices 148 and 149 Aldersgate Street London, E.C.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

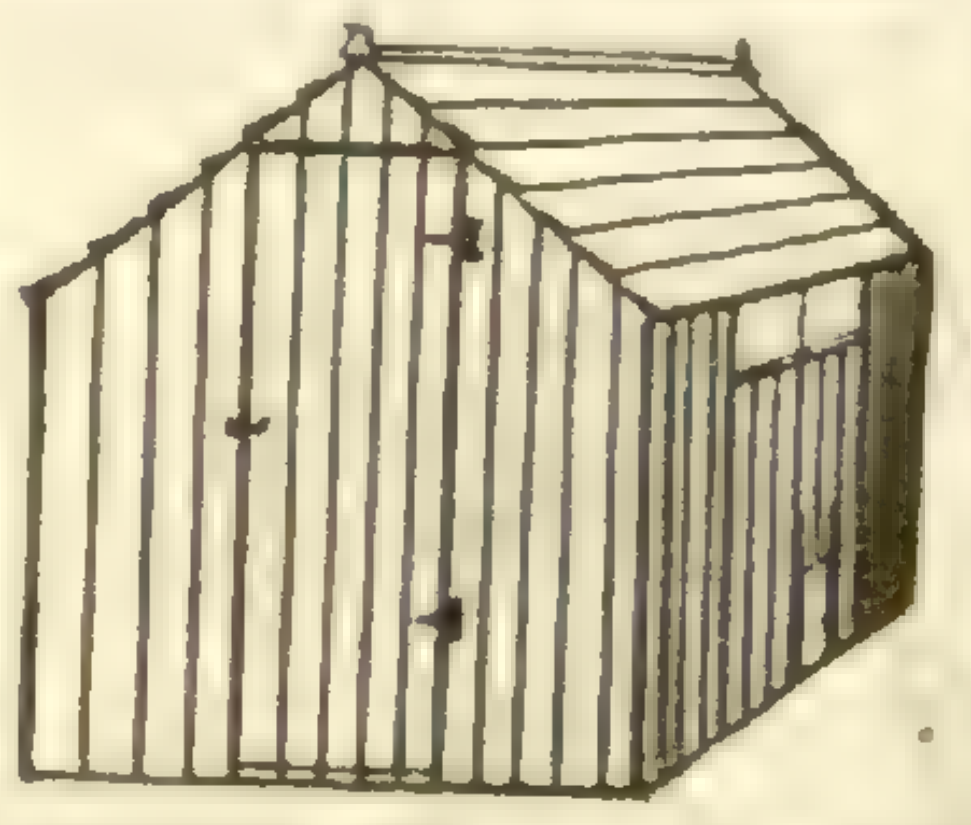


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more.

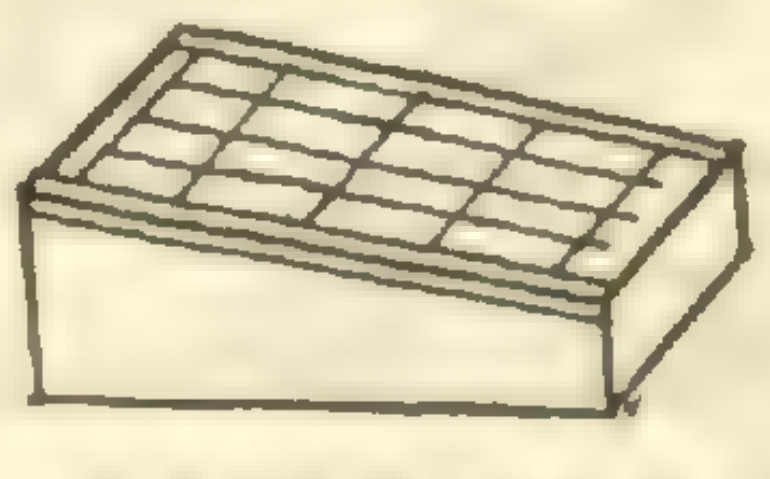
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.



4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

Situations Wanted.

Advertisements under this heading are charged 1s. each, four lines (32 words), and 3d. per line after. A Copy of the "Gardeners' Magazine," Post Free, 2½d.

THREE INSERTIONS FOR THE PRICE OF TWO!

A LADY, giving up her establishment, wishes to highly RECOMMEND her gardener (Head-working); experienced in all branches; married; fifteen years' character.—J. M., The Gardens, Eversfield, Reigate.

AS GARDENER (Single-handed or with boy); thoroughly experienced, Inside and Out; good reference.—Apply, F. C., 24, Bennett Street, Buxton, Derbyshire.

AS SECOND (where four or more are kept, or small place where help is given); understands glass, fruit, flowers, and vegetables; six years in last place; age 30; single; good references.—ABBOTT, Wetherden, Stowmarket, Suffolk.

AS GARDENER (Single-handed); experienced; Inside and out; good reference; three years [illegible] place; age 23; abstainer.—Apply J. G. C., 8, Warners' Lane, Church Gate, Loughborough.

FOREMAN.—George Picker, The Gardens, Hesslewood, near Hull, would be pleased to RECOMMEND his Foreman, George Sage, to any gardener requiring the services of a reliable young man; age 27; the cause of leaving, the breaking up of the establishment.

GARDENER (Head) lately returned from America, open for ENGAGEMENT; age 30; married; well up in growing and laying-out; six years' character from last situation.—T. B. MILLS, Brewery Road, Nailsworth, Glos.

GARDENER.—Admiral Sir W. G. Luard wishes to RECOMMEND his Gardener as HEAD, where two or more are kept; thorough practical man inside and out; ten years' reference; age 30; married, one child.—R. S., Lodge Cottage, Witham, Essex.

GARDENER (Head Working); age 33; married.—A Gentleman wishes to RECOMMEND G. STRICKLAND, who has been with him two and a half years as general foreman; eighteen years' experience in all branches of gardening, two years previous as foreman.—G. STRICKLAND, Elston, Newark-on-Trent.

GARDENER (Head); age 36; married, no family; first-class fruit, plant, and vegetable grower; twenty years' practical experience; highly recommended.—W. COLEMAN, 2, Montague Road, Datchet.

GARDENER (Head), where one or two are kept, or Single-handed; age 31; single; life experience in all branches; abstainer; good references.—GARDENER, 9, Myrtle Terrace, Crawley Road, Horsham, Sussex.

GARDENER (Head, or good Single); good all-round man; Inside and Out; life experience; age 40; married; wife help in house if wanted; good characters present and previous employers.—F. OSBORNE, The Gardens, Corner Hall, Hemel Hempstead.

GARDENER (Head Working), age 30; thoroughly practical in all branches; six years' excellent character as General Foreman here, two and five previous.—[illegible] PARKER, Gilston Gardens, Harlow, Essex.

GARDENER (Head Working or good Single handed); thorough knowlege of stove and greenhouse, kitchen garden, vines, peaches, melons, tomatos; age 38; married; small family, youngest seven; four and a half years' character from last place.—W. DAVIS, Chingford Road, Walthamstow, Essex.

GARDENER (Head-Working, where two or three are kept); experienced in all branches of gardening; age 38; married, one child; six years in present situation. —Address F. GOODWIN, Duns Tew, Deddington, Oxon.

GARDENER (Head-Working); age 30; life experience; thoroughly understands flowers, fruit, and vegetables, including orchids and carnations; well recommended by past and present employers.—J. DAWSON, Rangemore Gardens, Burton-on-Trent.

GARDENER.—WANTED, SITUATION as good Single-handed, or where two are kept; last situation twelve years; leaving through death of employer.—W. HANINGTON, 239, Boxley Road, Maidstone.

GARDENER (Single-handed or Second), where three or four are kept; nine years' experience; age 25; first-class references.—B., Fortismere Cottage, Fortis Green Road, East Finchley, N.

GARDENER (good Single-handed), or where help is given; good references; thoroughly understands flowers, fruit and vegetables; age 25; married.—H. HIGGS, Updown Hill, Windlesham, Surrey.

GARDENER (Single - Handed, or with assistance given); age 34; married; experienced in all branches.—C. TRANSOM, 53, Danbrook Road, South Streatham, S.W.

GARDENER (Single-Handed); age 48; married; fourteen years' good reference; understands greenhouse, flower, and kitchen garden.—Address W. S., 5, Stoneyard Place, Lee, Kent.

GARDENER (Single-Handed, or one Under); age 27; twelve years' experience; Inside and Out; three years in present place; married when suited.—For references apply J. SYKES, 18, Percy Terrace, Hendon, Sunderland.

GARDENER (Second, or Single-Handed); ten years' experience; Inside and Out; age 23; good testimonials.—G. G., 39, Evelyn Street, Deptford, S.E.

GARDENER (Second); age 23; where several are kept; eight years' good all-round experience; Inside and Out; decorations; well recommended.—RUSE, Brockham Park Gardens, Betchworth, Surrey.

LAD, aged 16½ years, WANTS SITUATION under gardener; two and a-half years in garden; good character; small premium if required.—A. G., Wickham House, West Wickham, Kent.

MAN, young, SEEKS SITUATION on Gentleman's Estate, or Caretaker; good plumber, gas and hot water fitter; handy at other branches; long references PLUMBER, 18, Beversbrook Road, Upper Holloway, London, N.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c. St. John's Nurseries. Worcester.

SITUATION WANTED as Head Working Gardener, where two or three are kept; or good single handed with help; age 35; married; one girl, age twelve; twenty years' good practical experience, inside and out; excellent references.—D., Friars' Lodge, Matfield, Paddockwood, Kent.

SITUATION WANTED by young man; age 20; Inside and Out preferred; two and a-half years' good character from last situation.—Address W. GREEN, Back Road, Old Catton, Norwich, Norfolk.

UNDER GARDENER, Inside and Out; life experience; good character from present employer; age 22; single; state wages.—E. STRACEY, Shrubs Hill Sunningdale, Berks.

UNDER-GARDENER, age 19, SEEKS SITUATION; six years' experience; Inside and Out; total abstainer; disengaged.—H. BINNEE, Sudbury Grove, Sudbury, Harrow, Middlesex.

WANTED, SITUATION as Head-Working GARDENER where three or more are kept; age 35; married, one child; highest references.—J. W., 37, York Road, Caversham Road, Reading.

YOUNG MAN, single, strong and willing, SEEKS SITUATION under good man, either in large or smaller place; leaving through no fault; Churchman.—H. C., Monkton, Taunton, Somerset.

250 Bulbs of the same kind will be charged at the 1,000 rate; 25 at the price per 100; 6 at the price per doz.

COLLECTION D.—For Spring Gardening, containing 1,520 Bulbs, £1 1s. Half this for 11s.

COLLECTION B.—For Indoor, containing 529 Bulbs, for 92 Pots or Glasses, £1 1s. Half this for 11s.

WEBBS' BULBS
FREE POST OR RAIL.
FINEST SELECTED ROOTS.

WEBBS' 21/- BOX
For Greenhouse Decoration, &c.

CONTAINS

- 1 **Amaryllis Formosissima.**
- 100 **Crocus**, five choice varieties.
- 12 **Chionodoxas.**
- 6 **Freesias.**
- 18 **Hyacinths**, choice named varieties.
- 12 **Ixias**, mixed.
- 9 **Jonquils**, sweet-scented.
- 6 **Narcissus Bulbocodium.**
- 9 **Polyanthus Narcissus.**
- 25 **Scilla Siberica.**
- 100 **Snowdrops.**
- 6 **Tulips, Duc Van Thol**, scarlet.
- 36 **Tulips**, do., **early single**, six varieties.
- 6 **Tulips, Rex Rubrorum**, double.
- 6 **Tulips, Tournesol**, double.

OTHER BOXES from **5s.** to **105s.** each.

WEBBS' BULB CATALOGUE,
Beautifully Illustrated, and containing complete cultural instructions.

POST FREE, 6D. GRATIS TO CUSTOMERS.

Seedsmen by Royal Warrants to H.M. the Queen and H.R.H. the Prince of Wales.

WORDSLEY, STOURBRIDGE.

DUTCH BULBS
Direct from the Grower to save the Middlem profit.

Roozen Brothers'
CELEBRATED
HYACINTHS, TULIPS,
CROCUS, DAFFODILS,
LILIES, NARCISSUS,
BEGONIAS, &c., &c.

Any Lady or Gentleman or Gardener to buy Dutch or foreign Bulbs should write at o for Roozen Brothers' Amateur Bulb Catalogue pages in English), containing complete c of all Dutch and foreign Bulbs and Plants at e ceedingly low prices.

FAVOURABLE TERMS.
Free delivery to destination on orders above £3

THE GARDENERS' MAGAZINE.

SATURDAY, SEPTEMBER 24, 1898.

NATIONAL CHRYSANTHEMUM SOCIETY, ROYAL AQUARIUM, WESTMINSTER.—Grand Japanese Chrysanthemums, Groups of Plants, Table Decorations, Deverill's Onion, and other Vegetable Prizes. OCTOBER 11, 12, and 13, 1898. Schedules of Prizes on application to
RICHARD DEAN, V.M.H., Secretary, Ranelagh Road, Ealing, W.

THE
BRISTOL CHRYSANTHEMUM SOCIETY (in consequence of the Great Fire at the Colston Hall) will hold their 35th ANNUAL SHOW in the
DRILL HALL, QUEEN'S ROAD,
ON WEDNESDAY, THURSDAY, AND FRIDAY,
NOVEMBER 16, 17 and 18 next.
Special Classes and Prizes for Amateurs: Twelve Guiuea Challenge Vase to be competed for, and a Five Guinea Challenge Cup for Amateur Competion. The Veitch Memorial Prize for Grapes. Gold, Silver, and Bronze Medals, Solid Silver Cups, &c.
Schedules free of the Secretary,
EDWIN G. COOPER,
Mervyn Road, Bishopston, Bristol.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The ANNUAL DINNER of this Society will take place at the HOLBORN RESTAURANT on WEDNESDAY, OCTOBER 5, at 6.30 p m.
MR. GEORGD BUNYARD, V.M.H., will preside. Tickets 5s. each, to be had of the Secretary,
W. COLLINS, 9, Martindale Road, Balham, S.W.

TO SECRETARIES OF FRUIT SHOWS, &C.—JUDGING OF FRUITS, FLOWERS and VEGETABLES, by STEPHEN CASTLE. F.R.H.S., Consulting Horticulturist, Bottesford Vineries, Notts.
Terms on application. Telegrams, "GRAPES," BOTTESFORD.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at One Shilling per line, the minimum charge being Five Shillings. Advertisement Office, 148 and 149, Aldersgate Street, London, E.C.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

FRUIT STORAGE.

THERE is unquestionably some room for a difference of opinion as to whether it is more profitable to store late-keeping apples and pears grown for market, especially the former, until they are approaching maturity, or to sell them within a short time of gathering, as so much depends upon local conditions. But there can be no question as to the importance of storage in the case of the supplies of varieties intended for late use, and the experienced cultivator makes his arrangements accordingly. The question of fruit storage is, therefore, one that immediately concerns all who are engaged in the production of supplies of hardy fruits for private establishments, and, consequently, should have fuller consideration than is bestowed upon it by the general body of cultivators. It is essential the trees should be carefully pruned, kept free from insect enemies, and supplied with fertilisers, according to individual requirements, to ensure an abundant harvest; but unless the fruit is stored under conditions favourable to it keeping satisfactorily the efforts of the cultivator will not be of much avail. An immense improvement has of late years been effected in the method of storage in many instances, and when we call to mind the admirably arranged, yet inexpensive, fruit rooms that are to be met with in many gardens, it is astounding so large a number of makeshift contrivances that are in existence should be tolerated. In some instances we find a shed at the back of a forcing or plant-house converted into a fruit room; in others a loft over a stable is considered to be an admirable place for the storage of choice fruits, and we might give other examples in which the fruit is placed under conditions equally unfavourable to keeping its full length of time, and attaining to a high state of perfection. But these must suffice for the purpose of showing that there is in many instances an urgent necessity for reform, and impressing upon the owners of gardens that they cannot have fruit of high quality unless they provide a proper place in which to keep it until it is ready for the table. We know that many cultivators fail to obtain permission to execute their plans and erect fruit rooms in accordance with advanced ideas, because of the somewhat prevalent belief that a properly equipped fruit room is costly to build. But, as the experienced fruit grower is so well aware, there is no justification for the views held upon this point. It is not difficult to expend a considerable sum in building and fitting up a fruit room; but the results will not be more satisfactory than those obtained from an inexpensive structure, provided, of course, it is designed on proper lines. It matters not if the room be severely plain, provided it is so constructed that the fruit is not exposed to sudden or material changes of temperature, to a parching atmosphere, or an excess of atmospheric humidity. An equability of temperature is readily obtained by means of hollow walls or double sides of wood, the intervening space of the latter being packed with some dry non-conducting material, and thatched roofs some eighteen inches in thickness. The hygrometric conditions of the air can be easily regulated by the ventilators, but in the case of apples very little ventilation will be necessary. The desirability of providing separate rooms for apples and pears where the quantity of fruit is sufficient to justify this being done cannot be too strongly insisted upon, as apples keep in the most satisfactory condition in a structure in which a low temperature and a moderate degree of atmospheric humidity are maintained; while pears require a moderate degree of warmth and a dry air to ensure the full development of their colour and flavour.

WATER.

THE abnormally long spell of drought under which all plant growers are now suffering brings home to us the immense importance of a commodity of which usually the abundant supply vouchsafed by Nature renders it one of those common things which we take as matters of course without troubling our brains about them. When we do give it a thought, we regard water as a mere adjunct to our comfort, and forget that, taking our world as a whole, we earth-dwellers occupy but a minor part of it, and certainly form a very decided minority in the whole census of the vitality which peoples it. Not only do the ocean areas form a watery empire far exceeding in extent that of the land, but the land areas are invaded and occupied by an innumerable army of watery settlers in the shape of lakes, little and big, grading down to ponds and puddles, and also permeated in all directions by these channels of supply, grading up from the thread-like rills of water, the offspring of the latest shower, to mighty rivers of hundreds or even thousands of miles in length. Above a certain level, too, even in the Torrid zone, water again monopolises the earth's surface in the shape of perpetual snow and ice, and at both poles does this so thoroughly that man himself, with all his arts and sciences, is baffled in his attempts at penetration. This, however, by no means defines the extent of the watery domain; the very air is pervaded with it in its invisible form of vapour; and going further still, instead of its being a mere adjunct to our comforts, man and all living things are mainly built of it, and our needs of it, whether for ourselves or our plants, are mainly dictated by the necessity of keeping up the internal supplies to prevent ourselves and them from shrivelling into comparative nothingness. Man forms the one exception among created beings whose needs are not satisfied by his bodily supplies, he has pressed water into his service in many other ways, and by allying it with heat profits by its expansive force under such alliance, not merely to make it do the bulk of his work on land, but to turn traitor, as it were, and enable him to invade the ocean's wide expanse as easily and almost as rapidly as he does that of the dry ground. Thanks to its beneficent invasion of the land, invisible as aerial vapour, or visibly in the form of legions of clouds, not only are our lovely landscapes shaped into hill and dale by the resulting rains, but are clothed with all the beautiful vegetation in which we plant lovers revel. Thanks to the cloudy army sweeping athwart the skies from their birthplace in the ocean, not only do our gardens teem with flowers, but our islands are clad with verdure from end to end, our country is seamed with waterways, and the immense majority of our enjoyments and pleasures may be traced to the use of the facilities and forces afforded by, and derived from, the water thus conveyed to us. Small wonder, then, that a perceptible diminution of the rainfall, extending over months, should cause a general sigh for a restitution of the average, and groans from not a few gardeners at the sight of their floral pets suffering the dire distress of drought which is now so general.

NAMING SPECIMENS AT EXHIBITIONS.

IT is evident that managers of flower shows are in many cases becoming very lax in the enforcement of regulations relating to the naming of specimens exhibited, with the result that a considerable portion of the competitive gatherings annually held are shorn of much of their educational value. The object of flower shows is to promote improved methods of procedure in garden management, and this object is necessarily accomplished by presenting to public notice the highest forms of cultural excellence, the diffusion of a knowledge of plants, flowers, fruits, and vegetables by the encouragement of representative collections at the exhibitions, and by affording cultivators an opportunity of becoming acquainted with the finest of the types in the several sections. Therefore, when the naming of the specimens is systematically ignored the exhibition must of necessity fail to accomplish the object for which it was held; and it appears to us a great waste of time and money to hold a show that cannot be of much benefit to the district beyond providing a pleasant holiday. Of what advantage, we would ask, is it to exhibit plants grown to the highest degree of perfection unless those interested have an opportunity of learning the names of the plants represented by the specimens? Of what avail is it to the cultivator to have improved varieties of flowers, fruits, and vegetables presented to his notice unless he can ascertain the names, and be thus in a position to obtain them if he so desires? The answer to each of these questions is obvious, and we trust that something will be done to improve matters in the direction indicated. Within the past few weeks we have visited several exhibitions, at which not a single object other than trade collections had a name attached to it, and in the course of the present summer we have observed at exhibitions considerably increased numbers, as compared with previous years, of collections unnamed. There is some difficulty in putting into force a rule that shall be effective in making naming imperative ; because the omission of a single name through inadvertance, or the removal of a card in the interval between the exhibitor putting the finishing touches to his products and the judges making their awards, would be followed by disqualification. We have no wish to increase the risk of disqualification, and therefore would not penalise collections in which a few of the objects were not named ; but we would suggest that a rule be put into force preventing those entering into competition which are wholly unnamed. It should also be insisted that the names be legible, and so placed that no doubt can arise as to which objects they belong. In the naming of dahlias there is much room for improvement, and we hope the time will soon come when the dahlia growers will substitute for the cumbersome, and otherwise unsatisfactory slips now in use, neat labels, such as are employed by exhibitors of roses and chrysanthemums.

Her Majesty's Horticultural Exhibits are always looked upon with the greatest interest, whether displayed at the Drill Hall, the Crystal Palace, or the Waverley Market, for not only are they from the gardens of the Queen, but they are examples of high horticultural skill, while considerable artistic merit is displayed in their arrangement. Readers will be interested to learn that Her Majesty was an exhibitor at Edinburgh a few days ago, as a result of the work done by the GARDENERS' MAGAZINE. It came about this way. A copy of the GARDENERS' MAGAZINE for October 9, 1897, was placed in the hands of Mr. P. Murray Thomson, the new and energetic secretary of the Royal Caledonian Society, and that issue contained an illustration, from a photograph, of the Queen's Exhibit of Fruit at the Crystal Palace Fruit Show a week previous. Mr. Thomson was so pleased with the display as represented and described in our columns, that he wrote to Mr. Owen Thomas, Her Majesty's gardener-in-chief, desiring him to make a display in loyal Scotland at the autumn exhibition of 1898. The request was laid before Her Majesty and readily granted, much to the delight of Edinburgh horticulturists. We believe that Her Majesty will also make a display of horticultural produce from Frogmore in Ireland at an early date.

Cure for Wasp Stings.—Dr. H. Shackleton, of West Hill, Sydenham, writes as follows : Referring to your note about wasp stings in your issue of the 17th inst. I don't think it would be wise to try hypodermic injections of cocaine in the tongue without medical advice, for several reasons ; among others, because the risk of collapse from such is a serious consideration with some people ; secondly, the danger of using a needle which has not been sterilized ; and again, it is not a very easy operation in that place, and the application of a fairly strong solution on the surface ought to suffice, as the mucous membrane absorbs the cocaine rapidly. A ten per cent. solution would be strong enough for the mouth, but for general use a twenty per cent. solution might be kept in readiness, and, of course, by adding an equal quantity of water at the time this would be available for tender parts. If the solution is made in camphor water it will keep well. But I certainly think the application of some alkali, such as ammonia, should at first be the rule.

Perpetual-fruiting Strawberries, if not fully justifying their distinctive title by producing an abundance of fruit throughout the year, give a continuous supply during the summer and autumn months, and are consequently useful in gardens where a supply of strawberries is required after the usual summer crop has been gathered. The Alpine strawberries, which have not as yet attained to so high a degree of popularity in this country as in France, are more continuous in fruiting than are the garden varieties which have descended from the Chilian and Virginian forms, and the refreshing fruit is highly appreciated by those who have acquired a taste for it. For some years past efforts have been made by the French raisers to combine the perpetual character of the Alpine varieties with the large fruit and luscious flavour of the ordinary varieties, and the success achieved has been sufficient to encourage them to persevere with the work in which they are engaged. One of the most important of the results of inter-crossing the two sections is the variety known as St. Joseph, which was so well shown at Westminster, on Tuesday, when an Award of Merit was made in its favour. This has fruit and foliage similar to those of the varieties of which the Chilian and Virginian strawberries were the progenitors and the continuous fruiting character of the Alpines. The fruits remind one of small examples of Keen's Seedling, and they are agreeably flavoured, and it was interesting to observe that they were being plentifully produced both by the old plants and the runners of the current season shown by Mr. Hudson, who considers St. Joseph a distinct acquisition to late strawberries, and we are in full agreement with him.

The Flora of China is so rich as to involve a large amount of work upon those who devote any considerable share of attention to its investigation. The enumeration of Chinese plants in the Journal of the Linnean Society is near completion in its original form ; but a long time must elapse before the enormous accumulation of additional material can be worked out. Dr. A. Henry has recently presented to the Royal Gardens, Kew, a further collection of some 2,500 numbers, which, he estimates, contains about 2,000 species. This collection is from Eastern Yunnan, and it has been roughly classified and some of the more striking novelties taken out for early publication in Hooker's *Icones Plantarum*. The novelties are numerous, but no distinct or obviously new generic type was detected in the sorting. Messrs. Bourne, Carles, Ford, and Hancock, and other correspondents, have sent smaller, though not less interesting, collections to Kew.

Fertilisation of Plants.—Mr. Francis Darwin discussed, at some length, at a meeting of the botanical section of the British Association, the origin and use of the Knight-Darwin law, which has been rendered familiar to botanists through Müller's well-known work on the fertilisation of flowers. Knight's share of the law would appear to be that he made the general statement of the tendency to cross fertilisation among hermaphrodite plants. In considering Charles Darwin's share Mr. Darwin gave an interesting sketch, illustrated by numerous quotations, of the definite statements of opinion on the question of flower fertilisation which appeared in Charles Darwin's works. The point emphasized was the misuse of the expression of the Knight-Darwin law. The statement that "Nature abhors perpetual self-fertilisation" would be a more correct enunciation of the law than the statement that "no organic being fertilises itself for an eternity of generations," though the latter was the more generally accepted as correct. Charles Darwin's generalizations might be stated as follows : (1) Fertilisation of some kind is of paramount importance ; (2) the vast majority of flowers being open justifies the conclusion that there is some advatage in cross as compared with self-fertilisation, which advantage makes it worth while for flowers to run the risks and incur the expenditure necessarily connected with openness, but avoidable by cleistogamy ; (3) direct experiment demonstrates the nature of this surmised advantage of cross over self-fertilisation. Finally, Mr. Darwin said that these generalisations, which were in substance to be found in Darwin's works, were still the foundation-stones of floral biology, and would stand as firmly if the Knight-Darwin law had never been formulated. What he really objected to was the tendency among some writers to fix down the whole of Charles Darwin's writings into the Knight-Darwin law ; then, when an exception from that law occurred, to declare that it would not hold ; and to throw over not only the law, but all those principles and generalisations which could only be obtained from a general understanding of Charles Darwin's works.

Forest Education of a scientific character has hitherto received but little attention in America as in this country, but its value is now recognized in the United States and in April of the present year the New York State Legislature passed an Act authorizing the trustees of Cornell University "to create and establish a department in the university to be known as, and called, the New York State College of Forestry, for the purpose of education and instruction in the principles and practices of scientific forestry." In the same Act, provision was also made to establish a Demonstration Forest of not more than 30,000 acres in the Adirondacks, to be purchased out of the funds set aside for the Forest Preserve Board, and to become the property of the Cornell University for the term of thirty years, and to be used for demonstrations of practical forestry. The sum of 10,000 dollars has been granted for the organisation and maintenance of the College and Demonstration Forest. This institution, the director of which is Professor B. E. Fernow, has been organized and the prospectus shows that the college will furnish systematic instruction in the science and art of forestry. The provisions for teaching the science relating to forestry in the university are ample, while the connexion of the demonstration area within the College of Forestry will furnish additional advantage for original work, research, and experimentation, in advancing the science and art of forestry. Some time must elapse before the College Forest is in the best shape for demonstrative purposes, but there is every promise that the institution will prove a success.

An Interesting Fern.—Mr. A. C. Seward has prepared an account of the external characters, internal structure, and geological history of a rare species belonging to the genus Matonia. The anatomical investigation of this fern was founded on some material received through the kindness of Mr. Shelford, of the Sarawak Museum, Borneo. Matonia is now represented by two species—M. pectinata and M. sarmentosa—both confined to the Malay Peninsula and Borneo ; in the Rhætic, Upper Jurassic, and Cretaceous rocks several closely allied ferns have been found. Matonia pectinata occurs at high altitudes—three thousand feet to five thousand feet—growing in damp places in the jungle. Its rhizome creeps along the surface of the ground and gives off long and slender petioles four feet to six feet long, which are divided into about twenty pinnæ with slightly foliated ultimate segments. The sori consist of five to eleven sporangia, covered by a circular indusium. The stem of Matonia pectinata is characterised by an arrangement of vascular tissue which appears to be peculiar among recent ferns. The rhizome is thickly covered with a felt of dark brown multicellular hairs, and the leaves are not given off in the usual regular order of succession. Matonia—so far known only as regards its external characters—has usually been considered as a type apart, and some writers have assigned it to a separate tribe of ferns. The anatomical characters fully bear out the isolated position of the genus. Among ferns Matonidium and Laccopteus agree very closely with the recent Malayan fern. There can be little doubt that the two living species of Matonia are the sole survivors of a tribe of ferns which in the Mesozoic period had a wide geographical distribution.

The Royal Caledonian Horticultural Society's exhibition, fully reported in our issue of September 17, proved a financial as well as a horticultural success. Her Majesty's exhibit was, of course, a great draw, and a gold medal was awarded her able gardener, Mr. Owen Thomas ; a similar award was made to Messrs. J. Veitch and Sons, Chelsea, while silver medals were secured by Mr. H. J. Jones, Ryecroft Nurseries, Lewisham ; Messrs. W. Thomson and Sons, Clovenfords ; Messrs. R. Wallace and Co., Colchester ; and Messrs. and W. Buchanan, Kippen. Special awards were made to Messrs. M. Campb Blantyre ; Dicksons and Co., Edinburgh ; J. Downie ; Dobbie and C Rothesay ; J. Cocker and Sons ; M. Cuthbertson, Rothesay ; J. Forbes, Hawick ; A. L J. Grieve and Sons ; C. Irvine, Jedburgh ; Kerr Brothers, Dumfries ;

and Son, Rothesay; R. B. Laird and Sons, and T. Methven and Sons. Certificates were awarded to Mr. W. Angus, Aberdeen, for a double sweet pea; to Diamond Jubilee Black grape, from Messrs. D. and W. Buchanan; and to Mr. M. Campbell, for a yellow carnation named Miss Alley. The takings at the Waverley Market were above the average, but not quite so large as at the Diamond Jubilee Show of 1897. On the 16th inst. the fruit exhibited by Mr. Owen Thomas was by command of the Queen distributed by the council among certain of the Edinburgh hospitals, and thus was a very pleasant finish made to the work in connexion with the Caledonian Society.

The Belladonna Lily (*Amaryllis belladonna*) is now contributing liberally to the attractions of gardens in which it is successfully cultivated, and in many instances the crowds of delicate pink flowers are a veritable surprise even to some who have been engaged in gardening a sufficient length of time to justify their being regarded as veterans. There is, of course, nothing remarkable in the fact that the plant is now flowering, for this is its season to do so, and if we call attention to the fact it is not for the purpose of saying that it is flowering at its usual season, but to remind cultivators of the existence of one of the most beautiful hardy plants that have a place in the floral procession. There should be no occasion for this reminder, but there are many thousands of gardens in which it would make a vigorous growth, and produce a wealth of flowers that do not contain a single bulb. Why a plant so beautiful, inexpensive, and easily cultivated has not been more generally planted is not easily determined, but it is probable that a want of appreciation of the importance of the essential cultural details has been a hindrance. Like other bulbous plants from the Cape a thorough season of rest is necessary, and as experience has shown, this can only be had when the bulbs have the advantage of a little additional warmth from an adjoining wall, and are kept comparatively dry during the winter. These essential conditions can be obtained by planting at the foot of a wall with a south or west aspect, previously placing in the bottom of the border six or eight inches of crocks or broken bricks, and covering the layer with half-rotten manure. There are but few gardens in which a suitable position could not be found for a few dozen bulbs and to show its suitability for widely separated districts it will be of interest to mention that it is equally at home at St. Fagan's Castle, South Wales, and at Harewood House, near Leeds, one of the coldest parts of Yorkshire. At Kew it blooms profusely, and extremely beautiful displays are annually produced in several narrow borders alongside the plant houses. Amaryllis belladonna is figured in the comparatively rare folio by Philip Miller, published in 1760 under the title of "Figures of the most Beautiful, Useful, and Uncommon Plants," and according to the accompanying letterpress there was then considerable doubt as to the native country of the plant, and this doubt does not appear to have been satisfactorily cleared up until quite recently. It was said to have been collected by Sir Hans Sloane in Barbadoes, but Miller states that he was unable to obtain bulbs from the island. It seems to be quite clear that it was introduced into this country in 1812 from Portugal, by, writes Miller, "a gentleman who had long resided in that country who informed me that the roots were brought from India into that country, and were propagated by some curious persons in their gardens." Miller also states that he had received from Holland, whence it had been brought from the Cape in 1754, a species with paler flowers, and blooming in the spring. Forty-five years after the publication of Miller's work, the Belladonna Lily was figured in the *Botanical Magazine* (t 733), but Curtis evidently knew nothing definite as to its native country, for he considers it "more than probable that it is a Brazil vegetable." At that time (1804) the bulbs were imported in large quantities from Portugal.

Retention of Odours.—The power of a smell to cling to a substance seems, in Professor Ayrton's opinion, to depend neither on the intensity of the smell nor on the ease with which it travels through a closed space. Musk has but a faint smell, but the recollection of the greeting of a rich Oriental survives many washings of the hands. The smell of rose leaves, again, is but faint, and it travels very slowly through air in a tube; and yet the experiments on its propagation in the glass vacuum apparatus were rendered extremely troublesome, by the difficulty experienced in removing the traces of the smell from the glass between the successive tests. Rubbing its surface was quite ineffectual, and even the mercury had to be occasionally shaken up with alcohol to free it from the remnant smell. This absorption of scent by glass, and the ease with which jasmine flowers could be distinguished from woodruff leaves, even when each was enclosed in a series of three envelopes specially prepared from glazed paper, and when many precautions were taken to prevent an odour being given to any of the envelopes in the operation of closing, as well as to prevent its diffusion through the joints in the paper, led Professor Ayrton to try whether an actual transpiration through glass could be detected with the nose. For this object a number of extremely thin glass bulbs were blown from soda and from lead glass, so thin that they exhibited colours like a soap bubble, and felt, when gently touched, like very thin oiled silk, and after a little ammoniated lavender, amyl nitrate, ethyl, sulphide, mercaptan, solution of musk, oil of peppermint, and propylamine had been introduced into them respectively, they were hermetically sealed, and placed separately in glass stoppered bottles. In some cases, on removing the stopper from a bottle after many hours, a faint odour could be detected, but so, generally, could a minute flaw after much searching; the crack, however, being so slight that it did not allow sufficient passage of the air to prevent the bulb subsequently breaking, presumably from changes of atmospheric pressure. In those cases where a smell was detected without any flaw being found in the glass, the subsequent breaking of the bulb put an end to further testing, and the question therefore remains unanswered.

Agricultural Education and Research.—Major Craigie states in his annual report to the Board of Agricultural on the distribution of grants for agricultural education and research in 1897-98, that the total amount distributed during the financial year to each of the fifteen institutions receiving assistance was £7,200, as compared with £7,000 in the previous year. The grants were made as follows: University College of North Wales, Bangor, £800—College farm, £200; Durham College of Science, Newcastle-on-Tyne, £800—College farm, £200; University College of Wales, Aberystwyth, £800; Reading College, £800; Yorkshire College, Leeds, £600; University College, Nottingham, £600; South-Eastern Agricultural College, Wye, £600; Cambridge and Counties Agricultural Education Committee, £500; Eastern Counties Dairy Institute, Ipswich (dairy instruction), £300; British Dairy Institute, Reading (dairy instruction), £300; Royal Botanic Garden, Edinburgh (class for foresters and gardeners), £150; Bath and West and Southern Counties Society (field experiments, £50; cider experiments, £50; Cheddar cheese research, £200); Highland and Agricultural Society (field experiments), £100; Agricultural Research Association, Aberdeen (field experiments), £100; Stewartry of Kircudbright Dairy Association (cheese discoloration inquiry), £50. The grants to the collegiate centres in England and Wales are of a general character, intended to assist and improve the local provision made for instruction in the higher forms of agricultural education. The thirty-two separate counties are thus provided with an efficient and economical means of systematising their local instruction, and of supervising demonstration plots and agricultural experiments by securing scientific advice and the assistance of qualified lecturers drawn from the collegiate educational staffs. The Durham College of Science and the University College of North Wales have been granted special assistance in consideration of their having taken farms for practical work and field experiments.

The Value of Trade Exhibitions was discussed at some length at the Omaha Convention of the Society of American Florists, and in the opening paper Mr. E. Cushman spoke strongly in favour of them. He said trade exhibitions are of vital importance to every one who has anything to sell. They furnish a good opportunity for every plantsman and dealer who would make a business success. They are a gathering of the same lines of business under one roof, for the purpose of showing what growers have to sell, and giving an opportunity for comparison and the extension of business acquaintance not otherwise possible. These gatherings of commercial men with samples of their goods, in conjunction with a large gathering of consumers, is one of the very best advertisements possible. The wideawake and practical men soon have the rough corners worn off at these shows, and usually the conceit taken out of them, if they have any. There are so many good things in connexion with these trade gatherings, Mr. Cushman said he was sure it must be a poor man who does not get value received for exhibiting or attending our conventions. With reference to the display of plants and flowers at home, Mr. Cushman observed—"Trade requires you to show the newest and best you have. You must fulfil this requirement, or lose custom. Show your goods, is a law of trade as essential to us as to any other line. Business men fully realised this, hence the great combination spending millions of dollars and resulting in our great expositions. Go into our cities and see the quantities of valuable goods placed attractively in large show windows, placed with all the skill and art that trained help and costly fittings can command, and you can form some idea of the value placed on trade displays in other lines of business. Our retail flower stores are not behind in this grand effort at display, for they, too, are abreast of the times in showing their beauties, with all the accessories of glass, gilt, and electric lighting. It is not possible for me to approximate the value of these displays to the business itself. I know a prominent florist who estimates the actual value of his window display at not less than fifty dollars per day, what its direct value to him is I cannot say, but that this one window has been of great indirect value to the balance of the city's flower trade, I have but little doubt. Through blistering summer, and frosty winter, that grand, beautiful live flower picture is feeding the hungry who cannot possess, and drawing the dollars from the rich who see only to possess. In the language of the proprietor of this store, 'they walk right in and buy.' Truly I believe this display is richer than the eye can see, and he who makes it is a benefactor of his race, be he the individual taken as an illustration, or any one of the hundreds making the same efforts."

Flax Culture.—It is evident from the recently issued returns that the cultivation of flax in Ireland is pursuing the same course as hop cultivation in England, only at a more rapid rate. This year's area of the flax crop is only 34,489 acres, or 24·3 per cent., practically one-fourth, less than that of 1897. Less than twenty years ago, in 1880, flax crops in Ireland occupied an extent of 157,534 acres. The areas of flax since then have shown a decrease continuous. This year's area of 34,489 acres barely exceeds one-third of that of four years ago, and is less than one-half of that of two years ago, so that the recent withdrawal of this important fibre crop from cultivation has proceeded at a rapid rate. Whether, as in 1884 and 1893, some effort may now be made to again extend the acreage remains to be seen. This year's area comprises 34,215 acres in Ulster, 146 acres in Connaught, 69 acres in Munster, and 59 acres in Leinster. The largest county areas of flax are 7,981 acres in Antrim, 6,205 acres in Londonderry, 5,840 acres in Tyrone, and 5,572 acres in Down.

United Horticultural Benefit and Provident Society.—The annual dinner of this admirably managed and otherwise excellent society will take place at the Holborn Restaurant on Wednesday, October 5, at half-past six p.m. Mr. George Bunyard, V.M.H., will preside, and a large muster of members and friends is anticipated.

The Granadilla (*Passiflora quadrangularis*) is fruiting now in a very free manner in the Royal Botanic Gardens, Edinburgh, where a specimen of this Nicaraguan plant is planted out, and its quaint four-angled growths trained up the rafters of an intermediate house. The fruits, of considerable size and egg-shaped, depend from the growths, and as there are about twenty of them hanging, the plant is quite a feature in the glass houses. The Granadilla is largely cultivated in the tropics for the sake of the purplish and sweet pulp that forms the bulk of the interior of the greenish-yellow fruits.

NEW PLANTS, FLOWERS, AND FRUITS.

Lælia splendens.

A charming hybrid, obtained by crossing L. crispa and L. purpurata, and one in which the former species is very evident. The sepals are narrow, with reflexed margins, pale rose; petals broad, prettily waved and crisped, also pale rose. Lip long, pure white along the tubular portion, creamy in the throat; front lobe very long and spreading, deep violet purple with pale wire-edge margin. A.M., R.H.S., September 20. Messrs. J. Veitch and Sons, Chelsea.

Cattleya intertexta.

A bold and beautiful orchid, obtained by inter-crossing C. Warneri and C. Mossiæ. The flowers are about seven inches across; the sepals are narrow and flattened at their apices, rose-purple; petals broad, somewhat waved at the margins, rose-purple with deeper veins. Lip very fine, two inches wide, and of an intense violet-purple hue stained with crimson-purple and margined with rose. A.M., R.H.S., September 20. Messrs. J. Veitch and Sons, Chelsea.

Miltonia Binoti.

A pretty but not very showy miltonia, free-flowering, and of neat habit; the flowers are about two inches across, sepals and petals buff, with a large and irregular rufous brown area on each; the bases are stained with rose. The broad and flattened lip is deep rose, shading to paler rose at the apex. This orchid is supposed to be a natural hybrid between M. candida and M. Regnelli purpurea. A.M., R.H.S., September 20. Mr. W. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking.

Miltonia leucoglossa.

A very pretty white-lipped miltonia with flowers over two inches across. The sepals and petals are almost equal, and spreading, creamy or greenish, with a cluster of deep purplish rose spots at their centres. The spreading lip is pure white, save for the rose and red stain near the creamy disc. A.M., R.H.S., September 20. Mr. W. H, White, orchid grower to Sir Trevor Lawrence, Bart., Dorking.

Dahlias.

Viscountess Sherbrooke is a bold and handsome cactus dahlia of good form, colour clear and bright orange. A.M., R.H.S., September 20. Messrs. Keynes, Williams, and Co., Salisbury.

The Clown. This reminds one of Arachne in its colouring of white and scarlet, but it has broader segments, is bolder and of better habit. A.M., R.H.S., September 20. Messrs. Keynes, Williams, and Co., Salisbury.

Countess of Lonsdale is a charming cactus dahlia with very spiky segments that are of a soft rosy-scarlet, a colour that is not far removed from deep salmon. A. M., R. H. S., September 20. Messrs. Keynes, Williams, and Co.

Progenitor is probably the first of a new race; it is a cactus form of the brightest scarlet colour; segments long and broad and much divided at the apex into a sort of elk's horn arrangement that gives the flower a most distinct and pretty appearance. The variety is not likely to be sent out for another year or so. A.M., R.H.S., September 20. Messrs. Keynes, Williams, and Co.

The Duke is a most compact and neat pompon variety of a very bright crimson colour. A.M., R.H.S., September 20. Messrs. Keynes, Williams, and Co.

William Neat is a good self show variety of a curious reddish terra-cotta colour. A.M., R.H.S., September 20. Messrs. Keynes, Williams, and Co.

Watchman is a showy fancy dahlia of good size; golden ground, striped with crimson-scarlet. A.M., R.H.S., September 20. Messrs. Keynes, Williams, and Co.

Antelope, a rich and deep scarlet cactus dahlia with rosy points to the segments. A.M., R.H.S., September 20. Messrs. J. Burrell and Co., Cambridge.

Lucius, an orange cactus dahlia, previously described in our columns. A.M., R.H.S., September 20. Messrs. J. Burrell and Co.

Demon is a compact and very bright crimson pompon dahlia. A.M., R.H.S., September 20. Mr. Seale, Sevenoaks.

Distinction, a soft rosy-crimson pompon dahlia, purple tinged. A.M., R.H.S., September 20. Mr. Seale.

Leslie Seale we have already described—a single variety. A.M., R.H.S., September 20. Mr. Seale.

Peacock is a deep crimson fancy single dahlia with white tips to the segments. A.M., R.H.S., September 20. Mr. Seale.

Snowflake, a white pompon already described. A.M., R.H.S., September 20. Mr. Seale.

Iris, a curious little pompon dahlia with buff ground and rosy tips to the segments. A.M., R.H.S., September 20. Mr. C. Turner, Slough.

Claribel, a pompon variety previously described. A.M., R.H.S., September 20. Mr. C. Turner.

Ranji, a splendid dark crimson cactus dahlia of fine habit and form. A.M., R.H.S., September 20. Mr. G. Humphries, Chippenham.

David Jonson, a good rosy buff show dahlia, described in connexion with the N.D.S. A.M., R.H.S., September 20. Mr. G. Humphries.

Chrysanthemums.

May Manser, a large-flowered early chrysanthemum of Japanese form; the younger flowers have a yellowish centre, but this quickly fades to soft white. A.M., R.H.S., September 20. Mr. H. J. Jones, Lewisham.

Louis Lemaire, a free-flowering sport from M. Gustave Grunerwald; it has bronzy or chestnut-yellow flowers of good size and substance. A.M., R.H.S., September 20. Mr. W. Wells, Earlswood.

Pandanus Sanderi.

This handsome pandanus has repeatedly been referred to in our columns since its exhibition at the last Ghent show. It differs from P. Veitchi in having creamy-green variegation instead of white, and in having a yellowish rather than a silvery appearance; it is a handsome and useful plant for table and other decoration. F.C.C., R.H.S., September 20. Messrs. F. Sander and Co., St. Albans.

Gynerium argenteum aureo lineatis.

A form of the well known Pampas grass, but differing from it in having a rather dwarfer habit, and leaves that have marginal bands of yellow. The plant has a very distinct and attractive appearance. A.M., R.H.S., September 20, Messrs. J. Veitch and Sons, Chelsea.

Populus Ontario variegata.

Apparently a very attractive poplar, with the young leafage freely stained and striped with yellowish-green. A small branch was shown, and from such a specimen it is impossible to obtain an adequate idea of the tree; a small specimen tree should have been staged. A.M., R.H.S., September 20. Mr. J. Carter, Keighley,

Adiantum Faulkneri.

A pretty and most elegant adiantum, somewhat after the style of A. Lawsoniana, but of more compact growth; the pinnæ are very small and slightly crimped. It should make a useful fern for a variety of uses. A.M., R.H.S., September 20. Mr. Thomas Rochford, Turnford Hall Nurseries, Broxbourne.

Ligustrum Walkeri.

An elegant plant when in a small state as shown; it has simple green leafage and an inflorescence that is not effective. The plant is not hardy at Kew, where it needs greenhouse or temperate house treatment. F.C.C., R.H.S., September 20. Messrs. Paul and Son, Cheshunt.

Hibiscus syriacus totus albus.

This is a well known pure white flowered variety of Hibiscus syriacus, and one well worth even more extended culture than it has. A.M., R.H.S., September 20. Messrs. Paul and Son, Cheshunt.

Acer Juhlkei variegata.

This has very pretty foliage, the younger leaves having quite half their area of a creamy colour, but usually the variegation is very irregular. The backs of the leaves is silvery, so that in a breeze a tree would be very effective. A.M., R.H.S., September 20. Messrs. Paul and Son, Cheshunt.

Strawberry St. Joseph.

This is a late fruiting or perpetual strawberry, fruiting each season from successive runners. The berries are of medium to small size, conical, scarlet, brisk in flavour, with a pleasant acidity thus late in the season. A.M., R.H.S., September 20. Mr. J. Hudson, Gunnersbury House, Acton; Messrs. H. Cannell and Sons, Swanley; and Messrs. Bunyard and Co., Maidstone.

THE REDSTART.

This is a very beautiful little bird, and one of our liveliest summer visitors, nor is he shy, but frequents gardens and the vicinity of human habitations, not, as some have ignorantly supposed, for the sake of preying upon the result of the labours of man, but because in such situations he is more apt to find a suitable nesting place than he is in the open country.

The food of the redstart may be said to consist wholly of insects, especially small caterpillars, for the few berries to which he helps himself in the autumn just before his departure from among us, are really unworthy of consideration when looked at in comparison with the armies of noxious insects he destroys during the time of his stay among us.

The redstart is a migratory kind, arriving about the beginning of April, and taking its departure early in September. The nest is made in the hole of a tree, wall, building, or even in the heart of a stack of faggots under a shed, or out of doors, and the nest is merely a collection of leaves and grass lightly piled together and lined with a few feathers, or with hair. The eggs are bluish green in colour, and from five to seven in number. There are usually two broods during the season, and it is not difficult to rear the young ones on ants' eggs and common maggots, but to attempt to do so with artificial food is to court utter failure and disaster.

The redstart has a pleasing little song, which can frequently be heard from the top of a tree in the vicinity of the nest, which can often be discovered by patiently watching for a few minutes the movements of the songster; but it is almost a pity to disturb the nesting of such a handsome and useful bird, which, moreover, can only be preserved in health for any length of time by feeding it with insects of one sort or another, though it will take a little raw lean meat shredded very finely, or a little bread and milk, or crumbled yolk of hard-boiled egg occasionally, but too much of such artificial diet is sure to bring on indigestion, and that a fit, before long, therefore care must be exercised in giving them. A few small berries may be supplied in the autumn, such as elder, privet, and rowan berries, also those of the ivy and currants, which are probably taken medicinally, much as cats and dogs occasionally eat a little grass.

The male redstart has the bill, the top of the head, and the breast of a deep black colour, more or less mottled with white when the bird is young, but this mottling grows less with each recurring moult, until it finally disappears altogether. The top of the head is white; the back of the neck, the back, and scapnears are light slate-grey. The rump and all the tail feathers, except the central pair, which are brown, are russet-brown, with a ruddy sub-tinge; the breast is red, and the abdomen reddish-grey; the under tail coverts are white, the legs and feet are dark slate.

The female is greyish brown, not very unlike a nightingale, for which they are occasionally passed off on the unwary. Very old females are said to assume all the colours of the male.

The redstart is nearly six inches long, but sometimes not more than five and a-half inches; the female is somewhat less than the male.

The young males of the year have no white on the head, and there is white mingled with the black of the throat and the orange red of the breast, which is also mottled with yellowish brown, like the young nightingales, from which the juvenile redstarts can be readily distinguished by the white spots on the breast and throat.

Even in its wild state the redstart is given to imitating the notes of other birds, and in confinement becomes a most accomplished mimic; some individuals are even said to have learned to speak a few words.

A female redstart was taken captive one evening as she sat on her five young ones in the nest she had made in the hole of a garden wall, and with nest and little ones was put into a cage, but in the morning she was found quite dead, but covering her infants with her wings, and they were dead also. Surely Moses was right when he commanded the Israelites not to take the dam and the young birds together.

T. W. Greene, F.Z.S.

CHRYSANTHEMUMS.

HOUSING THE PLANTS AND SUBSEQUENT TREATMENT.

About September 25 all houses which are to accommodate chrysanthemums should be ready to receive the plants. Such preparation of these structures as may be necessary will scarcely need pointing out; such work as cleansing of glass, and painting walls with fresh lime, will suggest themselves to all who know the importance of a wholesome cleanliness. The beds or borders, under staging which has for a long season been occupied with plants in pots, may probably have become wet and sour, which will impart to the house a bad condition of its atmosphere, and increase the risk of damping of the blooms. Any such soil should be removed from the surface, and a liberal sprinkling of fresh lime given, to be covered with cinders or clean ashes.

In large gardens there is often as much difficulty in finding room for a number of chrysanthemums as in small ones, for in proportion to labour and conveniences at disposal so much more is expected and absolutely required to meet the large demands made on the various departments of the garden.

Fruit houses which are cleared of their crops are always available, but in these there is the difficulty of too much shade from foliage, which, unfortunately for many plants that are perforce placed underneath it in September, does not admit sufficient light until towards the close of the following month. The best way of meeting this trouble is to place such varieties as have formed buds early, and are not likely to extend their growth after housing, under the most shady parts, and give later flower buds the benefit of the light. Peach shoots may be loosened and the trees pruned too, quite as well as deferring this practice until the fall of the leaves; the remaining growths may be tied in groups closely together if the wood is well matured, thus admitting a good share of direct light to plants under the trees. Vines may also have all lateral growths removed, and the shoots reduced to five or six leaves in length, which really in the case of early vineries is a good plan early in September, so that the vines may concentrate their forces in building up the buds and elaborating sap which vines, as much as any plant, are supposed to do for the next season's growth.

All this may be beside the question of housing chrysanthemums, but gardeners have to scheme so much in autumn to accommodate the many things which have been growing in the open during summer that its bearing on the subject is important. It is ruinous to house varieties with soft shoots and late-formed buds under the dense shade of fruit trees; flowers will ultimately develop, but the peduncles will have become so attenuated and weakly, and the constitution of the plant so impaired through want of light, that they will be of little use for exhibition.

It is better that all the plants should stand upon boards or something other than the border soil, so that a free outlet is ensured for water given to the roots. All shoots should be kept tied quite erect, or the blossoms will be liable to uneven development, and though such blooms may look nice on the plants, when cut they are found one-sided and awkward to fix in position. Rather than to injure the roots by putting more stakes in the pot, short light pieces of cane some two feet long may be secured below the bud and looped to the main stake.

After housing, ventilators, doors, and every means of giving air should be kept wide open until the plants have gradually become accustomed to their crowded condition, and cooler nights suggest the need of shelter. Each afternoon, when fine, give the foliage a light damping over, and continue doing so until the flowers begin to unfold; this helps to maintain something of the same moisture as was supplied by dew while the plants were outside, and prevents the change being felt so keenly. Fumigate thoroughly on two successive evenings, to clear the plants of any thrips or other obnoxious insects which may infest them, and also give the lower portions of the foliage a good dusting of sulphur. This latter may be only required as a preventive of the mildew; it is perfectly harmless, and is better used as soon as the plants are housed, as this is the time when the mildew is most likely to obtain a mastery of the lower leaves owing to the plants being so closely arranged together.

Water at the roots will not be needed so frequently after housing takes place, and must be given with careful judgment only when the pots clearly ring if rapped with the knuckle. Weak liquid manure may still be used, and as the flowers commence to unfold increase the strength of this for those which are not liable to "damping," until the blooms are about three-parts developed, when clear water only is required.

Frequently it will be found that one of the large green sepals which envelope the bud does not release its hold, and so as the flower stalk lengthens the bud is pulled slightly over to one side. If this is not attended to at once, the consequence will be that the flower will not regain its upright position, and when once the stalk has hardened, any attempt to straighten it results in breaking off the bud entirely.

Those growers with small convenience for housing their plants are often found with more plants in September than they have sufficient room for, but often, too, with several which are scarcely worth crowding in. It is better to give up such plants at once than to injure the well-being of good ones through undue crowding. Such, for instance, where buds were taken too late, may be very strong plants, and require room that they will not pay for occupying, or any weakly, unsatisfactory looking plants are better left outside altogether.

Occasionally the lights from a garden frame may be raised on posts and the sides closed round with mats to protect early varieties, which in this position may be shaded and kept cool more easily than in a house; the important item being to ward off heavy rains and dews from opening blooms, and to shield the plants from frost; or, with such early ones, if the trouble is not too great, the shelter of an outhouse at night, or during rain, will do for a time, carrying them outside when fit.

I hear from many quarters of the brown rust fungus on the under sides of the leaves having made its appearance during the past few weeks. This is due to spores having been allowed to scatter some time ago, and now that cooler and moist nights prevail they develop freely. Constant repression by picking off leaves or parts of leaves whenever it appears, and a syringing with weakly diluted sulphide of potassium is the best remedy I can offer. Burn every particle gathered from the plants, and before they are housed examine each plant thoroughly, so that as far as possible none is taken into the houses. In this way we may hope to exterminate the disease from our collections.

Trent Park Gardens. W. H. Lees.

NYMPHÆA STELLATA.

I gladly comply with your request to give some further particulars of our culture of Nymphæa stellata. Being desirous of adding a blue variety of water lily to our collection, I made a tank this spring for its accommodation, having doubts of its success in the open water of our lake. A suitable position was chosen where the influence of the sun would be fully exercised. This was at the western end of one of our ranges of glass, where it was easy to make a connection to the existing pipes for the purpose of warming the water in the lily tank. A three-inch flow and return pipe we find to be ample for keeping the water at a temperature of 70 deg. to 80 deg. The depth of the tank is eighteen inches, its other dimensions being eight feet by six feet, being so arranged as to accommodate a three-quarter span frame upon the top course of brickwork an inch or so above the water. No further provision in the way of piping was provided, other than that alluded to for warming the water, this piping resting on the bottom of the tank. Some coarse rubble was spread over the bottom, and upon that some rough sods of turf, adding afterwards sufficient soil in which to plant the lilies, this consisting of loam, leaf-soil, decayed manure, and road scrapings, in all to a depth of about four inches only.

The lilies which had been started in pans in a warm house were planted out on May 21, the plants having only a few small leaves then. Within a week the increase of growth was most marked, and within three weeks the first flowers were opening. From that time to the present the profusion of flower has been simply astonishing. I have counted frequently from eighteen to twenty-three flowers expanded at one time. The promise of bloom for weeks yet to come is excellent, in fact there appears to be no appearance of cessation or exhaustion. The frame alluded to was taken off and the lilies left fully exposed about the middle of June; it is now in readiness for placing upon them again when the weather becomes sufficiently cool to check the growth. One peculiar feature of this lily is that of sending up its flowers from one foot to eighteen inches above the water, each blossom being practically self-supporting. The fragrance is also another feature; it resembles that of violets in a marked degree. The duration of the flowers is from three to four days. They open quite early in the morning, and close from three to four o'clock in the afternoon. When the plants were put out I did not think they would grow so luxuriantly, hence they are now rather too crowded. Another season I shall experiment with some of them in the open water.

Gunnersbury House Gardens. James Hudson.

SCALDING OF GRAPES.

In your "Answers to Correspondents" you say, truly enough, that scalding is due to the action of strong sunlight upon berries that are more or less covered with condensed moisture. It has also been thought and said by some that each globule of the moisture may condense the sun's rays into a burning lens. Atmospheric air at rest probably discharges similar functions. Bad glass is also, as you say, answerable for scalding; inequalities of surfaces or knobs in the glass are converted into burning lenses. Hence, anything that will absorb or prevent the deposit of the vapour on grapes sets and keeps the air of vineries in motion; in other words, early or perpetual ventilation proves a sure antidote to, or remedy for, grape scalding. There is thus, under perfect and constant ventilation, perpetual motion in the air of vineries, and this disturbs or destroys the action or the powers of the burning or scalding lenses referred to. Plenty of air all night is the surest remedy. The next best antidote to grape scalding is to give air at the top of the vinery before the sun has raised the temperature a single degree. By adhering to this rule no scalding need be feared. The amount of air given need not be much, but the rules here laid down as to morning ventilation, being ahead of any rise in temperature, must be adhered to.

There are yet other and more mechanical causes for the leaf and berry scalding of vines. Rods, leaves, bunches are often crammed so close to the glass that the free passage of vapour, water, air is blocked by the leaves. Under such stagnant conditions the heat becomes intense, and scalding of the worst sort inevitable. By training each rod from a foot to eighteen inches free of the glass roof scalding of this sort would be wholly prevented.

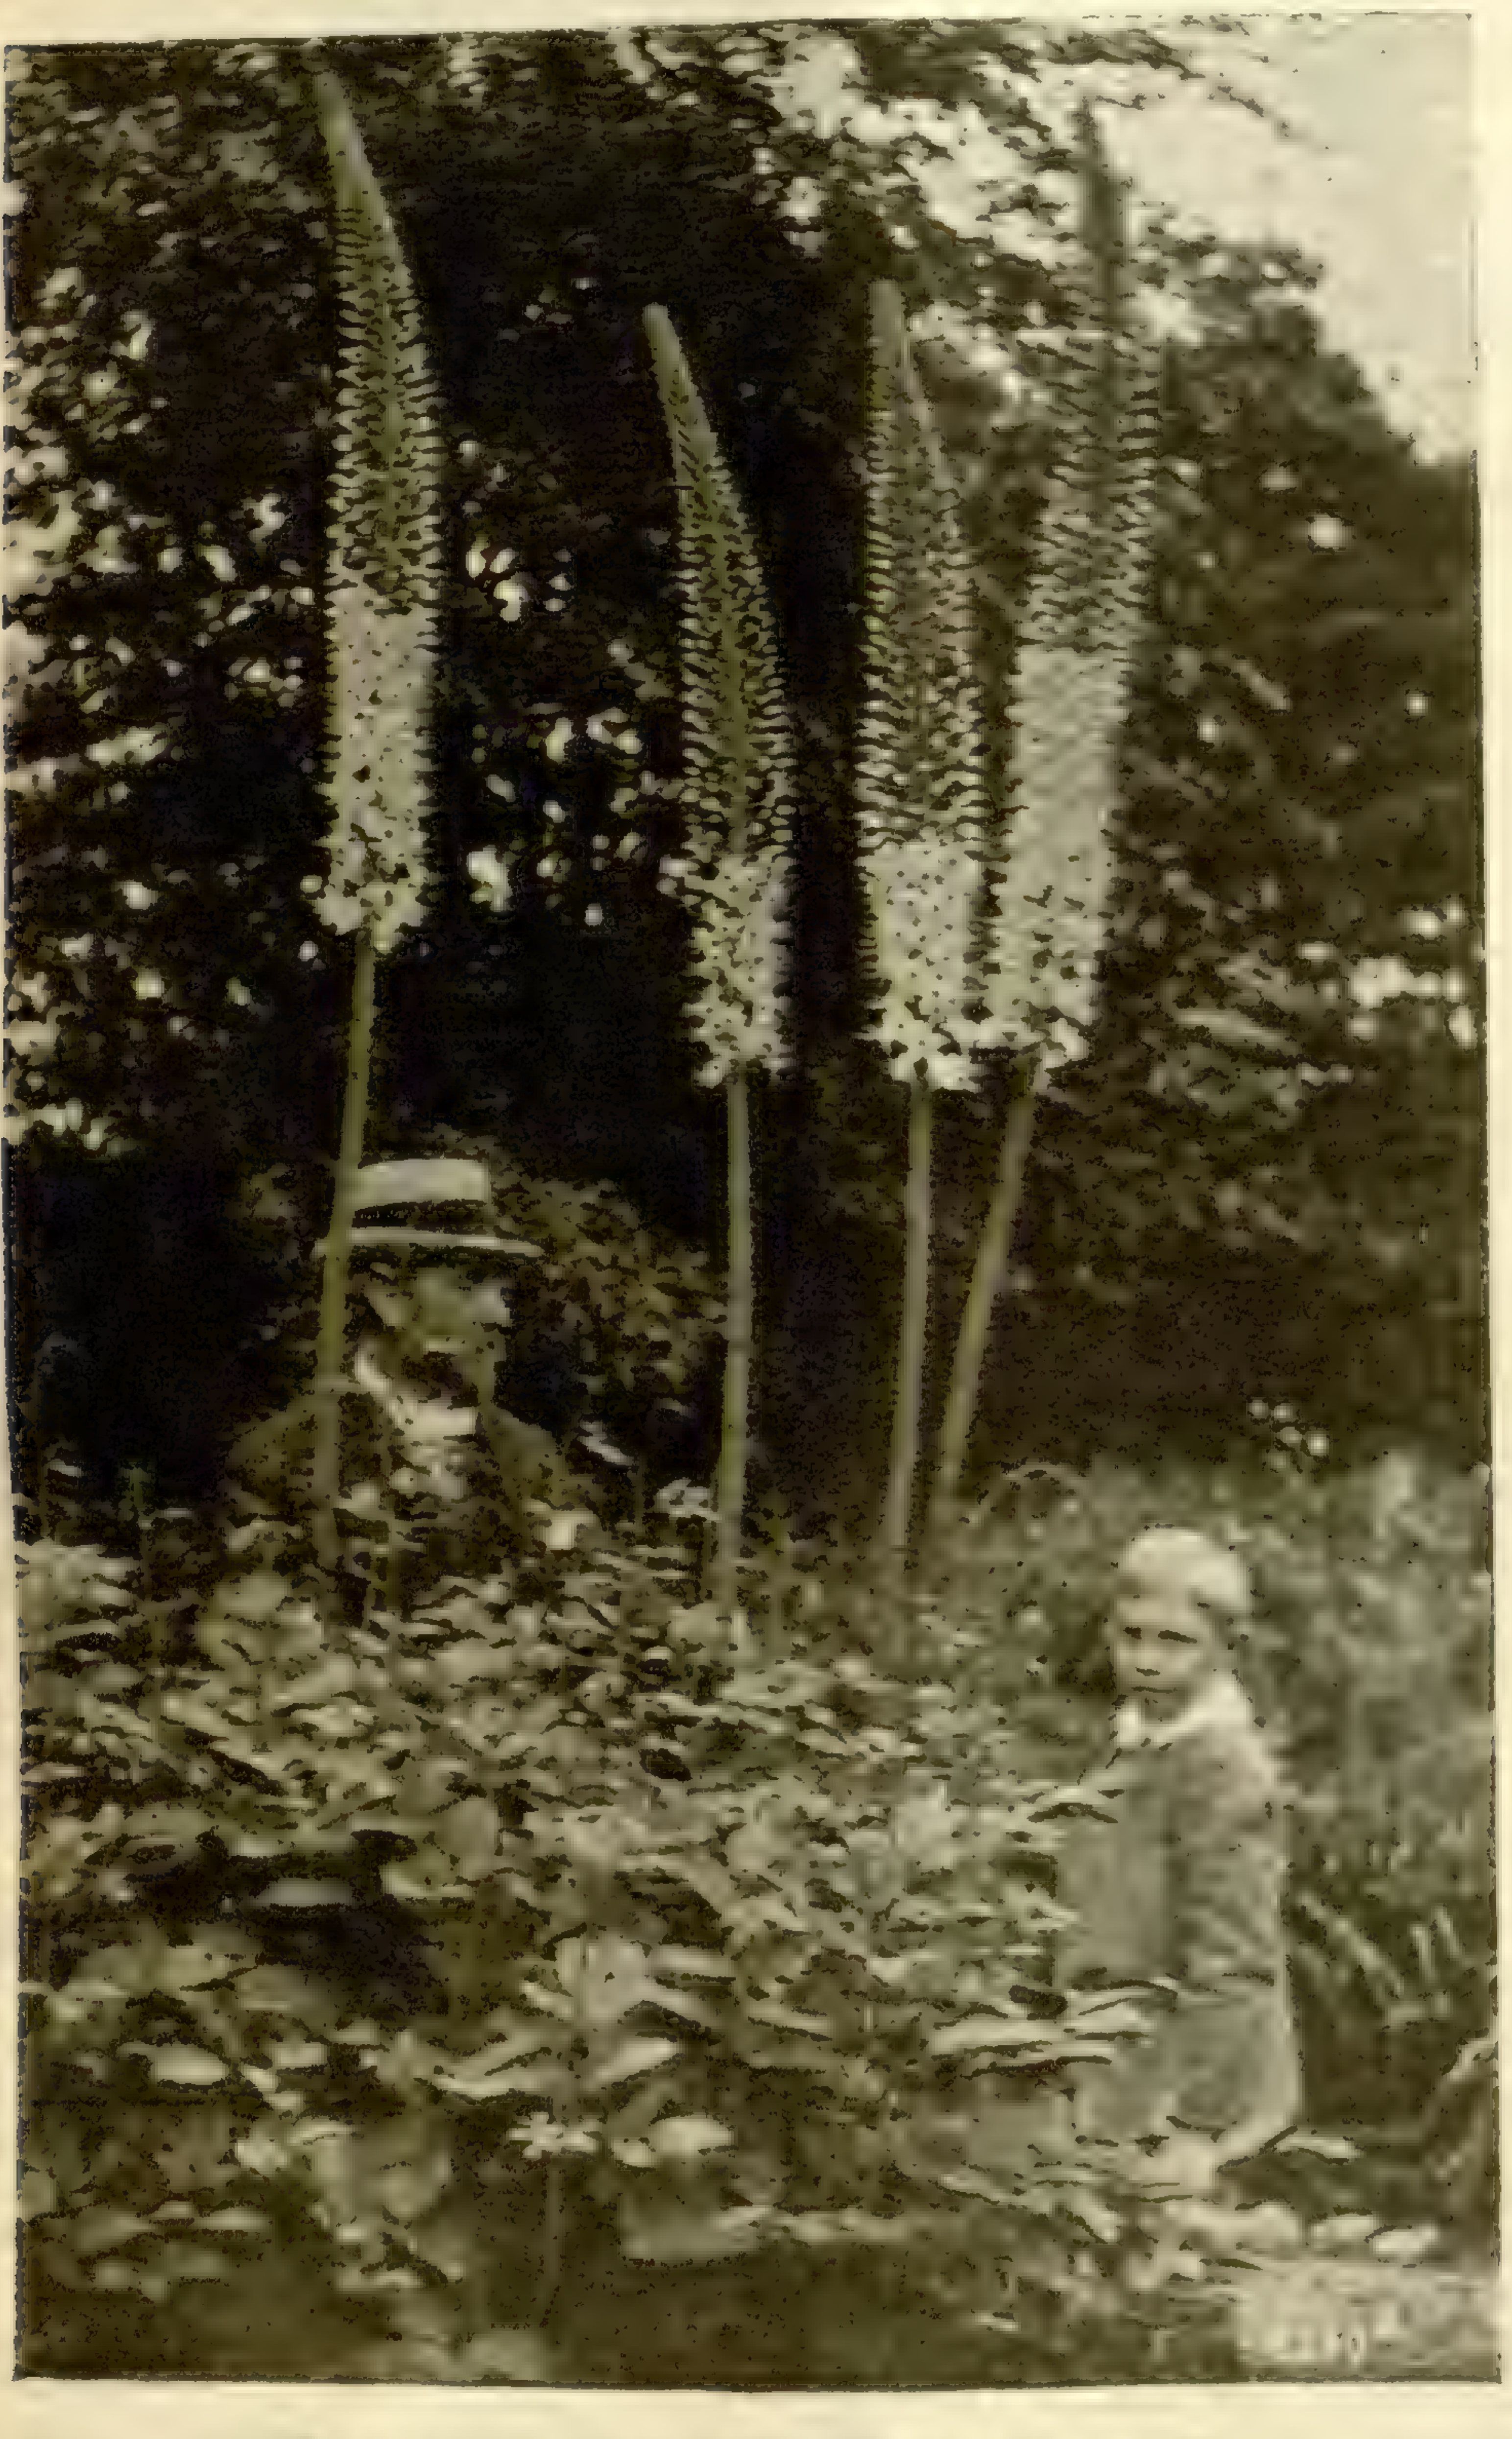
D. T. Fish.

Productive Dwarf Peas.—A few days since I cleaned up the ripe produce of some ten rows of diverse dwarf and medium-height peas that had been grown for trial in rows twenty-five feet long, and all treated alike and laid on the ground. It was very interesting to note how very much some excelled others in productiveness, and of course this productiveness indicates clearly the pod produce for gathering. Materially in excess of others were Sutton's Dwarf Defiance and Magnum Bonum, Sharpe's Triumph, Webb's Senator, President Garfield, and Majestic. Certainly there may have been causes in some cases for others coming out indifferently, as, for instance, seed growth in the spring not being good. We are so apt to regard excellence in peas per size of pod, that real average pod production is much overlooked.—A. D.

EREMURUS ROBUSTUS.

This stately hardy plant is yearly becoming more popular, and each season larger numbers of towering spikes are seen in gardens and nurseries. The species was discovered in Turkestan, and first flowered in the Botanic Gardens of St. Petersburg and Moscow in 1873, when Dr. Regel named and described it. The flowers vary slightly in colour, but are usually of a pale rose or peach shade; they measure two inches across, and many scores of them are produced on one well developed spike. In the Rectory Gardens, Scole, Norfolk, the Rev. F. Page-Roberts grows this plant finely, as the illustration, from a photograph kindly sent by him, will show.

Mr. Page-Roberts writes:—"The tallest spike in the picture of Eremurus robustus was eleven feet six inches, and the shortest nine feet six inches. The four plants were put in their present position after their seed had ripened at the beginning of August last year, a decisive refutation of those who say they ought not to be disturbed. Indeed, those which were not moved last year have not developed so remarkably. The difficulty is not in the cultivation, for this is simple enough, but in procuring good matured plants, eight years old at the least. All that is needful for the successful growing of these majestic, beautiful hardy plants to perfection is a rich light loam (I have, unfortunately, no good loam in my garden to experiment with), a sunny position, well sheltered from strong winds, which damage the leaves, an occasional dose of liquid manure, and protection from frost in the spring, when the leaves begin to expand and disclose the soft flower spikes. Water getting into them and freezing, cripples them. No protection is needed in the winter."



Eremurus robustus at Scole Rectory.

Two Good Tomatos.—From their first introduction I have beem familiar with the fine qualities of two good tomatos: Polegate, probably the very best stock of the old Perfection put into commerce; and Golden Jubilee, the very best of all the large fruited yellows. I saw both these varieties growing recently as tall plants, quite eight feet in height, at Tewkesbury Lodge, Forest Hill, and both were fruiting grandly. I cannot but wonder whence finer crops are to come. I have seen both varieties since in a tall, narrow span house at Regent House gardens, Surbiton, again fruiting very finely, and still tall, vertical plants. If yellow tomatos are in demand in the markets, then it would be difficult to excel Golden Jubilee for the purpose, and certainly no one could have handsomer, richer coloured, or more solid fruits than Polegate gave. Mr. Taylor, at Tewkesbury Lodge, estimated that his plants would yield him from ten to twelve pounds of fruit each.—A. D.

HOMOLOGY OF PLANTS.

By Professor F. O. Bower, D.Sc., F.R.S.

(Continued from page 602.)

Homology.

But various writers admit in varying degree this factor of comparison as controlling other considerations. There is indeed a wide range of difference on this point. I will cite only two extreme views. On the one hand is the view of Strasburger, which he enunciated so early as 1872. The enthusiasm for evolution in the Jena school found its botanical expression in the aphorism, "The highest problem of morphology is to explain the form of plants, but this problem can only be solved genealogically." This statement is repeated in a more definite form in Strasburger's text-book: "Phylogeny is thus the only real basis for morphology."

At the other extreme is the method of physiological organography put forward by Sachs in his lectures. I am aware that he subsequently modified his views; I merely quote the system which he propounded in 1882, as being the antithesis to that of Strasburger. For in the physiological organography descent is hardly taken into account at all; parts which are plainly of distinct origin by descent are classed together. This organography of Sachs, though introduced with all its author's charm of style, never convinced the botanical world, for it treated plants too much as the creatures of present circumstance. It may be taken as illustrating the extreme reactionary swing of the pendulum from the non-physiological attitude of the formal morphologists; a protest against the exclusion of function from the morphological arena. The protest was salutary, but its form was extravagant.

Let us now consider whither "phylogeny, as the only real basis of morphology," may lead us. Let us take as our provisional view that *homology* in the strictest sense implies repetition of individual parts, in successive generations, just as the hand of the child repeats in position and qualities the hand of the mother. Though among seed-bearing plants, for instance, this repetition may apply for the plant-body as a whole, it will be at once apparent that such repetition as regards the individual is found in comparatively few cases in plants. The continued embryology of all the higher forms, the indefinite number of the parts successively produced, and the variety in detail of their arrangement show that in the strictest sense repetition of individual parts cannot be traced. In a pan of seedlings of the sunflower, raised from seed of the same parent, the cotyledons in all cases may be regarded as homologus in the strictest sense, as they correspond in origin, number, position, and form to like parts in the parent. In a similar way the first root of the seedling appears to be individually identical with the first root of the parent, or of any other seedling of the batch. In those plants in which a foot or suspensor is present occupying a constant position with regard to the parts of the embryo, it will not be doubted that within near lines of affinity the foot in any one specimen corresponds to that of any other. The exact repetition which is thus found to exist may be regarded as the most complete type of homology.

Starting from this repetition of individual parts in plants nearly related, there is a divergence by gradual steps in two directions—firstly, in the individual plant, where the later formed parts may assume forms and positions which may even raise a question of their essential correspondence. Thus, in the batch of sunflower seedlings, there may be a varying number of leaves, with varying transition from the decussate to the alternate arrangement, intervening between the cotyledons and the capitulum. As they vary in number and position, these cannot, in the strictest sense, be accepted as individually comparable each to each by descent—the lineal representatives of like individual parts in the parent. The lateral roots also, though essentially similar, do not correspond each to each, either in number or in position.

Again, to go a step further, a fern prothallus produces antheridia and archegonia; their number and position are not uniform; by conditions of culture we have them under control, and can induce antheridia only, or we can induce a formation of archegonia upon the upper surface, where they are usually absent. Plainly these cannot be held severally as the exact representatives of like individual parts in a previous generation. Another exceptional, but most interesting, case is that of *Aspidium anomalum*, Hk. and Arn., which Sir William Hooker remarks is possibly an abnormal form of *Aspidium* (Polyst.) *aculeatum*, Sw. In this fern the sori, instead of being all on the lower surface, as in allied ferns, are often upon the upper surface of the leaf. There is no sign of tortion to explain the anomaly, while the sori themselves present no structural peculiarity except that they are sometimes quite destitute of indusium. There has doubtless been a transfer of developmental capability from the usual position of the sori to the anomalous one. In case of such transfers as these, we do not doubt that the parts in question are to be ranked as comparable to those in the normal position; we contemplate here, as in the case of the sunflower leaves, an essential correspondence, but not an individual repetition of the parts, and we learn that parts thus essentially corresponding to one another may be transferred to unusual positions.

Secondly, in plants more or less nearly related, those which are less akin may show so slight a similarity in detail that again questions of the essential corresponce of the parts may arise. Within nearer circles of affinity these questions will affect only the appendages of minor importance, which show less constancy of occurrence and arrangement, such as emergencies and hairs; but in case of plants less nearly akin the degree of correspondence of the larger members may become a matter of debate. Take, for instance, the three great phyla of living Pteridophytes, the Ferns, Equiseta, and Lycopods. While the sporophyte as a whole in each of these may be accepted as homologous by descent with that of the others, the question as to the true correspondence by descent of the leaves must still be open for discussion. It is a tenable view that the three phyla arose separately from a nonfoliar ancestry, and that the assumption of a foliar development, having in each case a different habit, and a different relation to the sporangia, led to the distinctiveness of the three stocks. Opinion on the point of homology by descent of the leaves of these Pteridophyta must at present remain in suspense; but the case is different with the leaf of Pteridophytes as compared with the leaf of Bryophytes; unless the whole morphological system of the time be in error, we shall be right in maintaining that these foliar developments have been distinct in origin from the first.

Now all the foliar parts above quoted would in a system of merely formal morphology fall into the category of "leaves." But if phylogeny be accepted as the only real basis of morphology, we must be prepared to split up the category based on mere time, place, and mode of origin, and to recognise in some cases repetition of individual parts; in others essential correspondence, but not individual repetition, owing sometimes to transfer of developmental capability; in other cases, again, a possibility of distinct origin by descent not actually proved; and, lastly, a reasonable certainty of distinct origin. The practical question for the morphologist is, having recognised these facts for himself, how is the matter to be best made intelligible to others?

A reconsideration of the term "homology" will thus be necessary: is it to be applied equally to such parts as are connected by lineal descent, and also to those which we have good reason to believe have resulted from parallel development in quite distinct phyla? Or, to put a finer point upon our inquiry, are we to distinguish in any way the cases of "individual repetition" from those of "essential correspondence"? In the latter case I think no good end would be served at present by accentuating this distinction by terms, the steps of divergence are so slight and gradual. None the less should it be clearly borne in mind that comparisons of parts commonly ranked as homologous in the plant body are based on a less complete individual correspondence than that of parts usually compared in the animal body.

But the case is different in dealing with parallel developments, and some doubt arises whether parts which probably, or it may be certainly, have arisen by separate evolutionary sequence in distinct phyla are to be classed as homologous in the same sense as those directly related by descent. This question was long ago taken up on the zoological side by Professor Ray Lankester, and it was shown that, the old word "homology" covered two things recognised as distinct from the point of view of descent. He defined as *homogenous* "structures which are genetically related, in so far as they have a single representative in a common ancestor." On the other hand, "when identical or nearly similar forces or environments act on two or more parts of an organism which are exactly or nearly alike: further, if, instead of similar parts in the same organism, we suppose the same forces to act on parts in two organisms, which parts are exactly or nearly alike, and sometimes homogenetic, the resulting correspondences called forth in the several parts in the two organisms will be nearly or exactly alike. . . . I propose to call this kind of agreement *homóplasis*, or homóplasy." Now this distinction of terms requires also to be observed in plant-morphology, and I am surprised that it has never yet been adopted by botanists, though we have long recognised cases of parallel development. I do not propose now to spend time in assigning these terms to familiar cases, but, to take the examples already cited, the leaf of a fern would be homoplastic, though not homegenetic with the leaf of a moss; or, taking examples from plants more nearly akin, it would appear possible that the leaves of the three distinct phyla of living Pteridophytes show merely homoplasy, not a true homogeny.

The successive foliage leaves of most plants are assumed in the individual to be the result of a mere repetition of development. But it is quite a possible view that in the plant-body (as is contemplated in the animal in those cases of "serial homology" which Lankester recognises as homoplastic) homoplasy may have had a place. We must inquire whether all those structures which we designate "leaves" have actually been the result of a development identical, or at least essentially similar as regards their origin in the race. The problem is, given a plant with numerous leaves of various form and function, to unravel the real story of their evolution. Two distinct factors may be contemplated as possibly occurring even in the individual, viz.:—

1. *Homogeny* of genetically related parts, with or without repetition of the parts formed.

2. *Homoplasy*, an origin of two or more distinct categories of parts, not genetically related, on the same organism.

Working upon either of these, and thus complicating the problem by obliterating such distinctions as may have existed at first, may be the phenomenon of *metamorphosis*. This has lately received its evolutionary definition at the hands of Professor Goebel, as restricted to those cases where there has been an obvious change of function. We see how change of function accounts for various forms of leaf in certain cases; but it does not follow that all leaf-forms on the same plant were so produced, by metamorphosis of a single original type.

The Lycopodineæ are particularly interesting in illustration of this point. It appears probable that *Phylloglossum* is a more primitive type than other living Lycopods; it has two kinds of leaf, the protophylls of different form from these, and arranged regularly on the strobilus; commonly there are no intermediate steps between them. This condition in a plant, which on general grounds of comparison we believe to be primitive, is certainly interesting, and we shall ask whether the two types of leaf have not arisen by distinct evolutionary sequence? In the genus *Lycopodium* there are certain species, such as *L. Selago*, which show alternately sterile and fertile zones; examining the limits of the sterile zones, we find at the base of each leaf an atrophied sporangium, similar in position to that borne by a sporophyll. When we compare this condition with that of *Phylloglossum* it apears probable that the successive zones are the result of a metamorphosis of a strobilus, which had a continuous apical growth, and unlimited repetition of sporophylls, but that some of these suffered atrophy of their sporangia, with the correlative effect of a larger vegetative development. A differentiation of the strobilus thus results in the plant as we see it, a production of foliage leaves by sterilisation of sporophylls. Recognising this, some may suggest that the protophylls originated in the same way. It is possible that they did; but it is equally possible, and, in view of the peculiar case of *Phylloglossum*, I think more probable, that in these plants we have an example of homoplastic development of parts distinct as to descent, while the limits of the two still evident in *Phylloglossum* became obliterated in the more complex case of *Lycopodium*. The proof of the point will be difficult or even impossible, but the eyes of botanists should certainly be open to recognise such individual homoplasy, should it occur, and to inquire whether it has really had a place in plant-development.

Returning now to homoplastic development in distinct groups of plants, the morphology of the *foot* provides interesting material for comparison, and especially so since there is no question of repetition here; for the comparison is between parts of which only one appears on each individual plant.

The term foot has been applied to that part of the embryo in Pteridophyta which serves to connect it physiologically with the prothallus; the term has also been used for the base of the seta in Bryophytes. Parts performing a similar function, but not referable as in other Phanerogams to the metamorphosis of cotyledons, are also found in *Gnetum* and *Welwitschia*.

In the Bryophyta what is usually called the foot is no definitely specialised structure; it is merely the absorbent base of the seta. It would appear probable that in the Bryophyta a true homogeny holds in all cases, as the requirement for it will have been uniform; and its basal position is also uniform, though some difference of detail does appear in the relation of this absorbing body to the first segmentations of the embryo.

In the Pteridophyta it is exceedingly difficult to be sure of the correspondence by the descent of the foot in distinct types, and indeed it should not be assumed that a specialised absorbent organ was always present, though general surface-absorption will naturally have taken place in all archegoniate embryos; indeed, the condition of some upright embryos is such that a foot would never have been described were it not for comparison with other types. In *Equisetum*, *Isoëtes*, *Botrychium*—all forms without a suspensor, and with an upright growing embryo—the hypobasal half of the embryo, with or without a root, is absorbent as in the Bryophyta, and is described as a foot; it is quite possible to see in them the continuation of a primitive absorbent organ. This may also be the case in the Marattiaceæ, and it is specially noted by Campbell that "in *Marattia* all the superficial cells of the central region become enlarged and act as absorbent cells for the nourishment of the embryo." From such types we may imagine the more specialised foot of the Leptosporangiate ferns to have been derived by a localisation of the absorbent function on one side only, which would be a natural consequence of the embryo taking a prone, in place of the vertical position.

A different course of events probably occurred in the Lycopodineæ. I am disposed to think that here the suspensor represents nothing more than a specialised part of the primitive absorbent organ; this seems to be indicated by the details as shown in Treub's figures of *L. cernuum* and *L. Phlegmaria*, in which the suspensor is continuous with the foot. But what is then the "foot" of *Selaginella*, which is quite apart from the suspensor, the root intervening? On this point I think we obtain light from *Welwitschia* and *Gnetum*, for in these we see an absorptive organ formed at a comparatively late period; and it corresponds in position and function, though not in time of origin or details of structure, with that of *Selaginella*. I conclude that the "foot" of *Selaginella* is probably a later formation, not comparable as regards descent either with the foot of *Lycopodium*, or with the "feeder" of *Welwitschia* or *Gnetum*. The latter are plainly of recent independent origin as comparison shows, and their actual position is defined according to the position of the seed in germination. Probably, then, there is homoplasy in such cases, not true homogeny.

Similarly with such structures as the pinnæ, stipules, indusium, corona, and still more so with such inconstant bodies as emergencies and hairs; when we speak of the "homologies" of these parts it is rarely the *homogeny*, or identity by descent, which we mean to express; usually it is only *homoplasy*, a comparison of parts similar, it may be, in form and position, or even in development and function, though not shown to be comparable by descent.

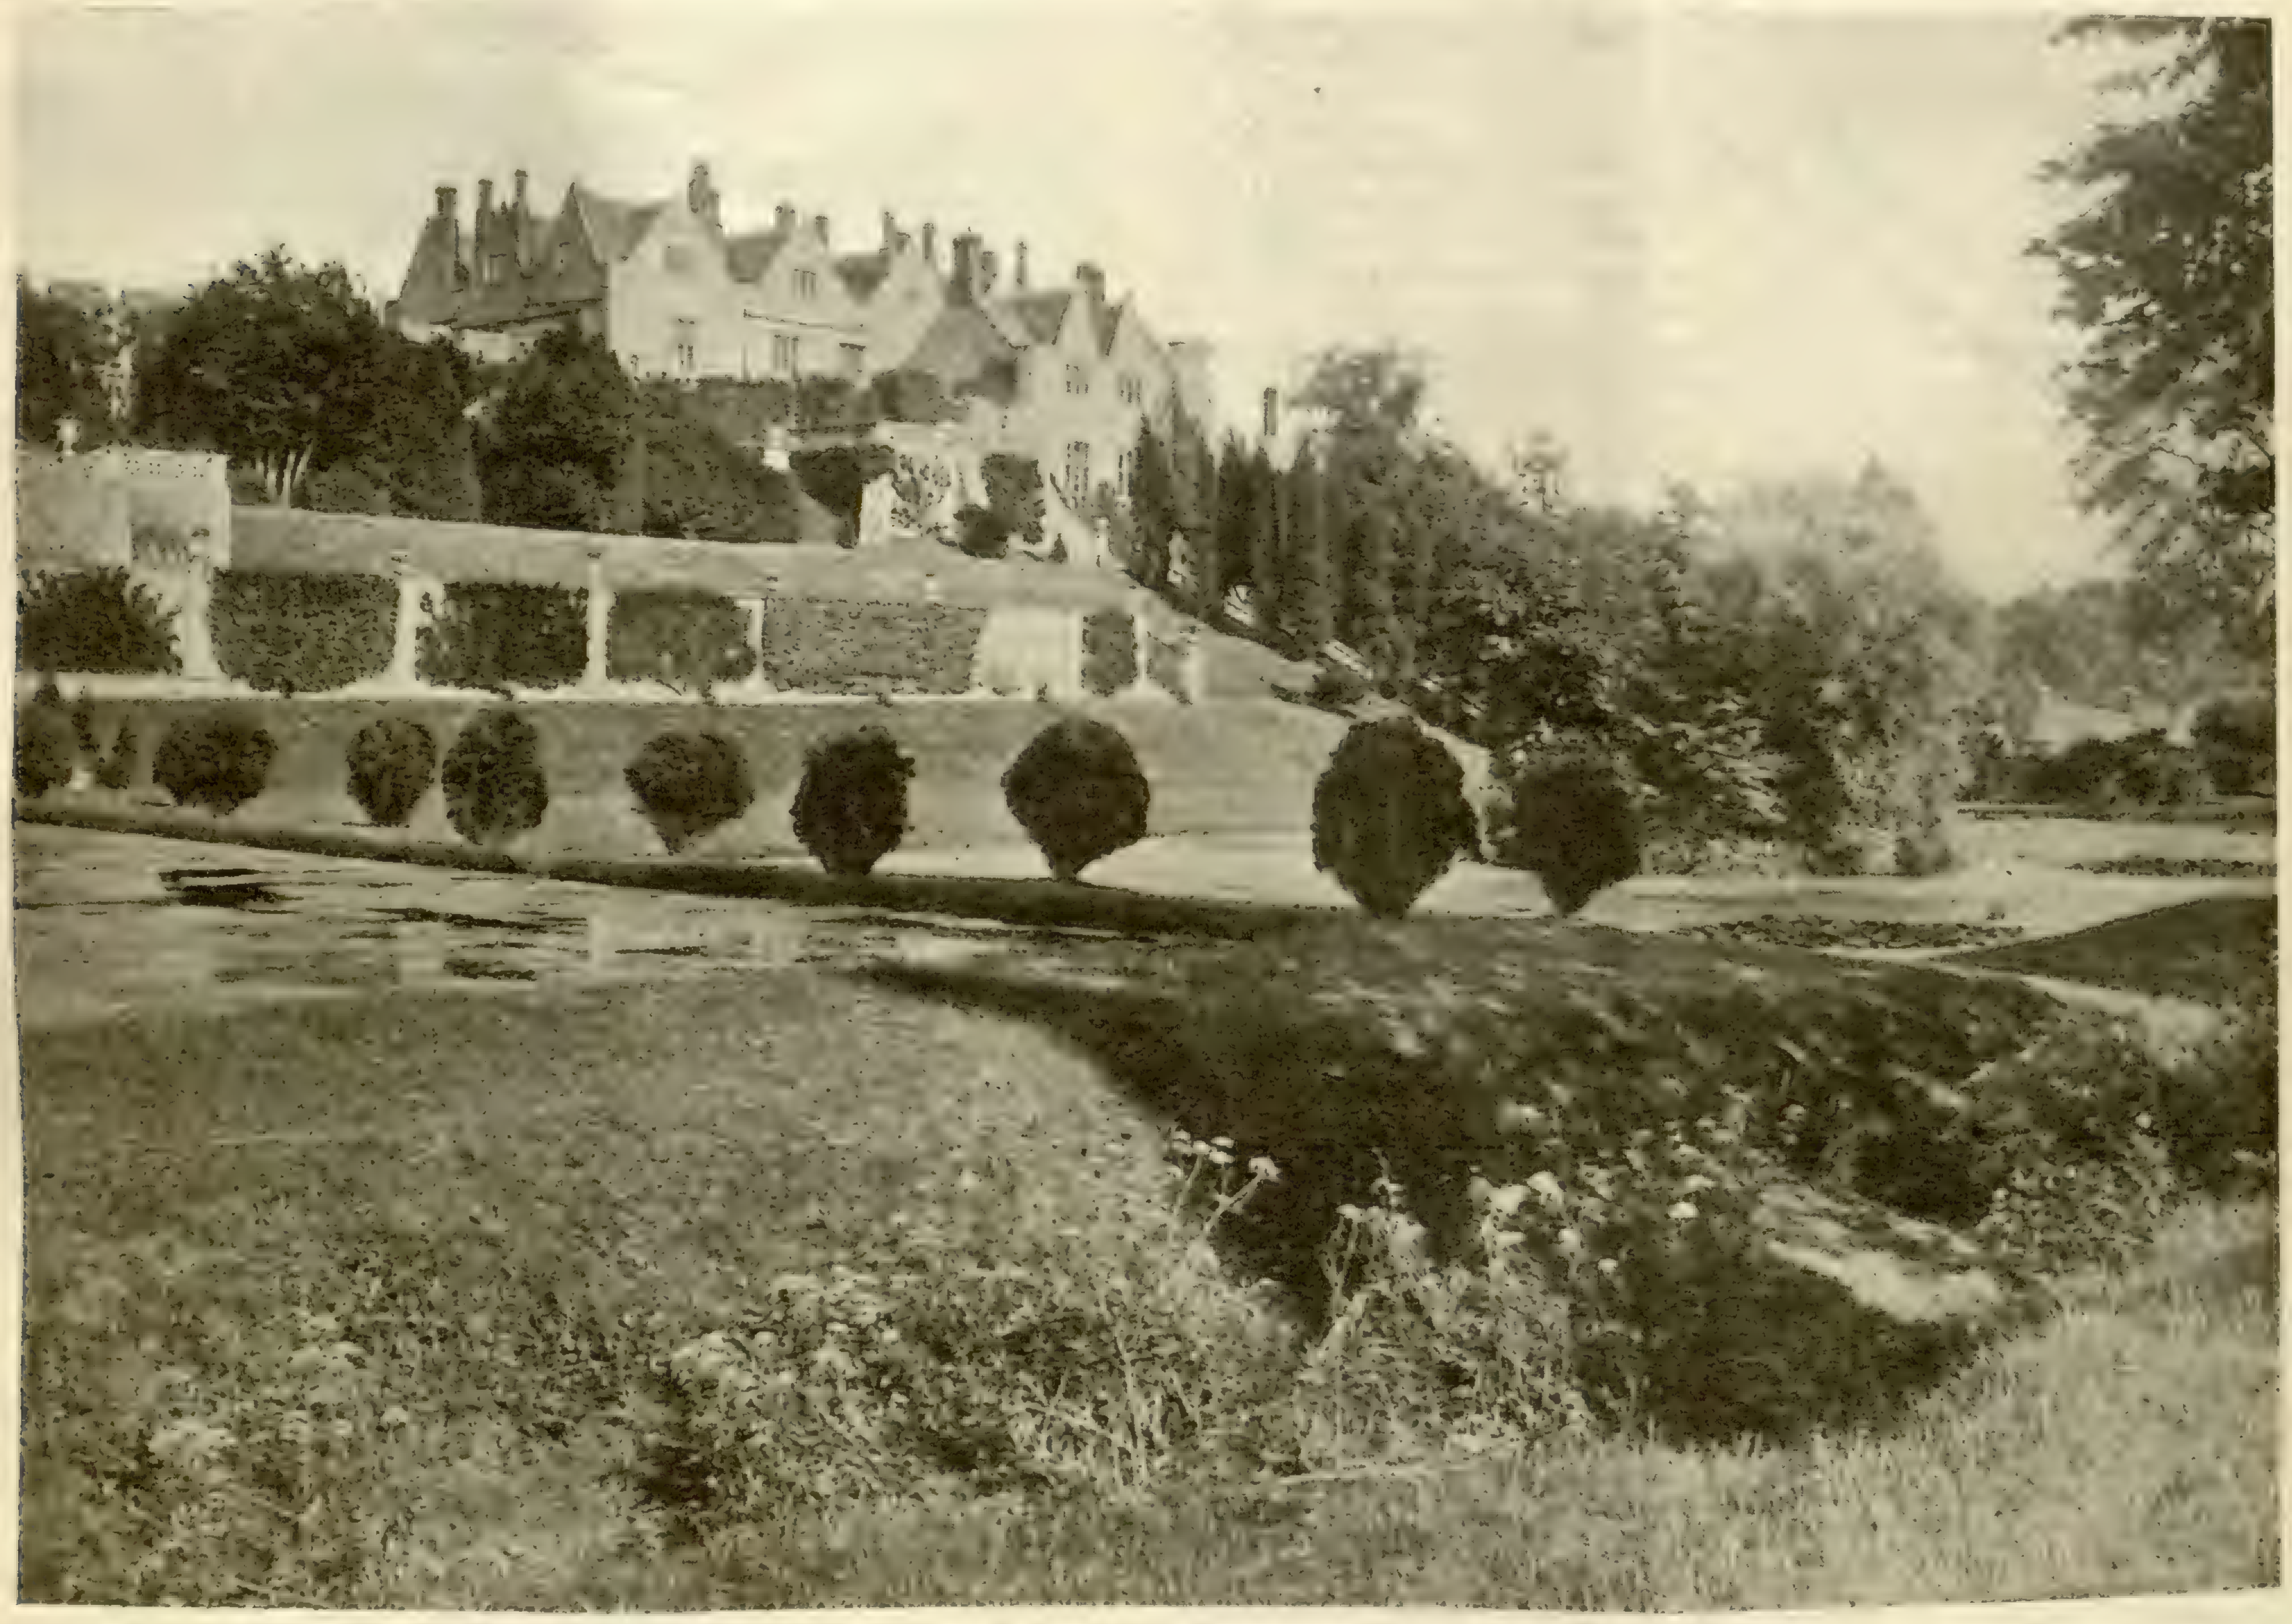
(To be continued.)

Autumn Sown Onions.—Your correspondent "Lux" has fired at me because I have somewhat, in his estimation, unduly trumpeted the merits of the Ailsa Craig onion, as I saw it both in an allotment and at a show, where the bulbs won in a class for autumn sown onions easily at Epsom. Now, had these fine bulbs been produced by "Peter" the trumpeting would have been all the other way, and readers of the GARDENERS' MAGAZINE would have been smothered in the tremendous overflow of Luxian eloquence. Well, I have a reason, for I wish to do the very thing he suggests, that is, try and induce show committees to change the terms of their class for autumn sown onions; and thereby induce cottagers and allotment holders to forego growing the all too speedily decaying Tripolis, and to sow instead such varieties as Ailsa Craig, Sutton's A1, Cranston's Excelsior, Banbury Cross, and other similar fine white and brown, round and globe varieties. Not only because these are quite as hardy, indeed, rather hardier, but also because they produce from autumn sowings very full bulbs that keep well when ripe till the end of the year, and therefore are far more valuable for domestic use or market sale than are bulbs that are ripe to-day and rotten to-morrow. Where onions in July and August are, though very fine and handsome, still growing it must be admitted that they are far more worthy of approval than are bulbs that have done growing, and will not endue a month longer.—A. D.

ST. FAGAN'S CASTLE.

St. Fagan's Castle, the seat of Right Hon. Lord Windsor, in Glamorganshire, is about four miles from Cardiff, and situated on the top of a brae, less than five minutes' walk from St. Fagan's Railway Station. It is approached on the east side by a short carriage drive, which is planted on both sides with young trees of Robinia psuedo-acacia. On the lawn, which is kept in splendid condition, are some old specimens of walnuts, cedars, and limes. The east side of the castle is covered with creepers and other plants, including the good old scented jasmine, Magnolia grandiflora, in full flower at the time of my visit, a week or two ago; and Ampelopsis virginica. The west side was already beginning to have a charming appearance with the autumn tint of the foliage of Ampelopsis Veitchi.

The gardens are on the north side of the castle, and surrounded with walls. Until Mr. Hugh Pettigrew succeeded to the charge of the grounds they were devoted to the cultivation of both flowers and vegetables; but, with good taste and a wise discrimination, he has decided, with the sanction of Lord Windsor, to make the whole into a flower garden, and to remove the kitchen garden to a more suitable place, quite away from the castle. Great strides have been made already in this direction, and further plans have been prepared for forwarding the work during the present autumn and winter. Amongst other things, a walled-off portion of the garden, at present given up to the growing of asparagus, rhubarb, artichokes, &c., is to be converted into a rose garden, for which purpose it seems admirably adapted. At the time of my visit the gardens were exceedingly gay with flowers of various sorts. There was one large bed on a slope which was particularly striking, composed of clumps of godetias, gaillardias, verbenas, African marigolds, gazanias, viscarias, antirrhinums, a dwarf crimson-flowered double dahlia, particularly good, and intermixed with such grasses as briza, hordeum, anthoxanthum, lagurus, and agrostis. The arrangement had been so tastefully made that the whole presented a charming appearance. There were many beds of the different kinds of annuals, among which I noticed scabious, salpiglossis, zinnia, stock, aster, petunia, helichrysum, centaurea, phlox, coreopsis, mignonette, larkspur, and valeriana, besides beds of those previously mentioned. There were some lovely beds of penstemons, here treated as an annual, and also a bed of Œnothera biennis. Sweet peas are largely grown, as they are so useful for cutting; they were flowering well, and amongst them were some particularly good varieties.



From photograph by Bedford, Lemere, and Co.

ST. FAGAN'S CASTLE, THE SEAT OF THE RIGHT HON. LORD WINDSOR.

The Dutch garden, with its box edgings, clipped box and bay bushes, with the flower beds one mass of bloom, showed that a great deal of time and labour had been bestowed upon it to bring it to such perfection. Near here were some fine lavender in vases. On the west side of the garden are the famous terraces of St. Fagan's. At the bottom of these are several artificial lakes in which nymphæas and other water plants abound. Beyond the lakes a small stream runs, and Mr. Pettigrew has considerably added to its beauty by planting British and other ornamental foliage and flowering plants along its margins. Several bamboos had already become established, and they will, no doubt, in a short time become a fine sight. Gunnera manicata, Osmunda regalis, Lythrum salicaria, and Spiræa ulmaria were amongst other things which had found suitable homes, or rather had suitable homes found for them. Dotted about on the terraces are well-trimmed bushes of Thuja aurea, and these, combined with the many vases filled with flowering plants, add greatly to the charm of the place. The terraces are separated from the garden by a wall which runs their entire length, and this is covered with vines and figs. At the base of the wall on the terrace side is a border containing principally herbaceous plants, though one of the most striking things in it is a row of fine lavender bushes, running from end to end. Hollyhocks, herbaceous phloxes, and Lilium tigrinum were amongst other plants which were in flower at the time. At the upper or north end of the lakes a rockery is to be constructed, and this, when finished, will be a great feature in that part of the grounds. From the terraces a splendid view of the pleasure grounds on the other side of the lakes may be obtained. White peacocks were strutting about amongst the trees, which include Scotch firs, tulip trees, cedars, sequoias (sempervirens), mulberries, some fine specimens of Quercus ilex, and some grand old trees of Robinia pseudo-acacia.

In the gardens are some fine borders of herbaceous plants, and these furnish an abundance of cut bloom for indoor decoration. The following were some of the things in flower: Phloxes, achilleas, chrysanthemums, helianthuses (single and double), Lychnis chalcedonica, Monarda didyma, and montbretias. Outside of the vineries a fine lot of Amaryllis Belladonna was in flower. The rose garden was still gay with bloom of both hybrid perpetuals and teas. Chrysanthemums are largely grown, and these were in the best of health, and promised well for a fine display of cut blooms and pot plants later on. There was a fine crop of wall fruit; the apricots were exceptionally fine, and peaches, nectarines, and plums were all that could be desired. Apples and pears were below an average crop, and small on account of the drought.

The houses showed the same good management as the grounds outside. The vines carried magnificent crops of well-finished bunches, the varieties grown being Black Hamburgh, Foster's Seedling, Madresfield Court, Lady Downes, Gros Maroc, Gros Colmar, and Muscat of Alexandria. The bunches of Gros Maroc were very large, well coloured, and finished, and good enough, I should say, for any show table. In the melon house was a fine crop of good, serviceable fruit. A splendid plant of Gloriosa superba was in flower in the stove, trained against the roof, which was also partly covered with Stephanotis floribunda. Crotons, dracænas, acalyphas (including the new Sanderi), Pandanus Veitchi, and the usual kind of stove plants were in the best of health. Calanthe Veitchi, a large quantity of which is grown, was simply growing like a weed; the plants had immense pseudo-bulbs, and these are bound to produce huge spikes of bloom. The greenhouse was bright with such things as begonias, fuchsias, petunias, and other flowers, mixed with ferns and Isolepis gracilis. At the bottom of the staging was a fine row of Adiantum capillus-veneris. On the roof there were trained several plants of Thunbergia alata, in three varieties, and Lygodium scandens, the whole having a very pretty effect. This former plant has become naturalised in Hong Kong, and it may be seen in flower in one particular locality covering at least a quarter of an acre of ground. Tomatos were an exceptionally heavy crop, both inside and out. After looking through the flower garden, pleasure grounds, and houses, I paid a visit to the place Mr. Pettigrew had selected for the vegetable garden. There I found growing peas, beans, turnips, beetroot, cauliflowers, &c., for, as one of the best known British gardeners said to me a few days ago, a man who can grow plants and flowers is no use as a gardener unless he can, in addition, grow good vegetables as well.

W. J. TUTCHER.

PRESERVING SURFACE ROOTS.

"LUX" must have been just recovering from an accidental overdose of some narcotic when he penned his notes on the destruction of peach roots (page 571), and I think "Mrs. Lux" will do wisely in seeing that her noble lord does not, in his hurry or zeal, run so serious a risk in future. In his dazed state we can easily understand his mistaking the shadow for the substance, and giving us a glimpse of the hallucinations which haunted his pillow in place of a faithful record of Peter's practice and results. Vine borders made into celery trenches? Vegetables grown on peach borders? Yes, to feed the vines and peaches! Peter's eye must be twinkling over the addition of this fertile ground to his vegetable quarters, and the huge crops of luscious fruits he can picture in his mind's eye in the near future. It taxes our credulity to its utmost limits to arrive at a conviction of such happy results, when we compare practice and its effect over a wide area, covering a period of thirty years. Theory, too, is at variance with "Lux's" contention, and these facts favour the supposition that it is only a rendering of the mutilated remains of a nocturnal vision he has deigned to publish for our edification or amusement. Although it is a step in a retrograde direction, that should be no reason why we should not consider it, for nowadays some of the new-fangled ideas are, to say the least of them, a little far fetched. In order to deal with the question thoroughly, we will take plants and soils separately.

Our aim is, or should be, to get our plants to grow quickly, produce the heaviest crops of the finest fruit possible in the briefest period of time. Not only should our aim be to accomplish this end, but also to maintain the same vigour and fruitfulness in the trees for years. Vigour and fruitfulness can only be attained by securing a balance between that part of the plant below ground and that which is above it. If we cut off a quantity of growths we shall give the balance to the roots, and shoots of a stronger nature will follow the next year. By continuing the practice for years the wood would soon arrive at such a strength that our ordinary summers would not ripen it, and fruit crops from such would be out of the question. This evil can, however, be remedied to a certain extent by crops, once the trees are in a bearing condition. The more vigorous the plant, the heavier the crop should be, and *vice versa*. Thus, by regulating the crop according to the strength of the tree, the evil effect of pruning is overcome, and a balance maintained between the two parts of the plant. On the other hand, if we prune the roots of a healthy, fruitful tree, we diminish its powers of supplying food to the stem and branches, and consequently minimise its ability in yielding crops. The equilibrium being thus upset, the plants' energy will be more feeble, the wood smaller, fruit inferior, and the crops thin ones. If the pruning of the roots be of a severe nature, and carried on annually, the plant will soon exhibit signs of a miserable existence, becoming worthless as a source of fruit supply, and be an eyesore in the garden, and a testimony to lack of skill of the cultivator, or circumstances to enable him to do otherwise.

It has often been remarked that "so long as the roots of a plant are all right it is surprising the amount of bad treatment it will submit to with impunity"; but "Lux," I think, can lay claim to being the first to state that maltreatment of the roots can be compensated with food. The soil, of course, is the storehouse and cooking department of plant food, and the better this larder is filled, and the more complete the machinery for breaking up crude organic and inorganic components with substances acceptable to the roots of plants, the more valuable it is regarded. Its depth, too, has a bearing on crops, but the surface portion will, under ordinary circumstances, always remain the most fertile. Even if we place a layer of manure, say, at three feet from the top, its decomposition will lead to gases being evolved which will find their way through the particles of soil upwards. The mineral matter, too, is brought to the surface by capillarity, as note the deposit of lime on the top of our calcareous formations, and nitrate of potash in some parts of India after a period of warm dry weather. The gases of the atmosphere also come most in contact with the outer crust, dissolving, feeding, and enriching it, and thereby moulding its condition to suit the requirements of plant life. Besides these we have the sun's influence, the principal factor in plant growth, warming the particles, aiding chemical changes, and fostering life in the surface soil. Knowing all this, we cannot be ignorant of the fact that the substratum, be it loam, gravel, or clay, is in no wise equal in any respect to supporting plant growth like that which rests upon it, and this apart from the tillage operations which the surface receives. Therefore, if the roots of fruit trees are annually destroyed in the first nine inches of surface soil, and the plants have to be fed from the cold, hungry, under layer, with its crude compounds, could we expect healthy, vigorous, fruitful wood in them? Certainly not anything approaching that produced by trees whose roots are left undisturbed nearer the surface,

TERRACE GARDEN, ST. FAGAN'S CASTLE. From photograph by BEDFORD, LEMERE, AND Co.

and cared for there. Let me take a few plants that have come under my care, as illustrating the evils of cropping fruit tree borders with vegetables, and see how they bear out the foregoing.

When I took charge of the gardens at Castle Howard, about three hundred feet run of a wall had been more or less given up to apricot culture, and the border utilized for various things. The trees were in a very unhealthy state; many of their branches were dead and dying, and annually each tree would throw up one or two gross shoots, which partially died off the following winter. These trees were all cleared out; the ground worked eighteen inches deep, and others planted. Part of the border was again covered with herbs. The trees planted where the herbs occupied the border did little good; some actually died, and the whole eventually had to go to the burning heap. Not so with the others, for I never saw finer, healthier, fruitful trees than they were, and the individual fruits were really the largest I had met with. Another wall, also about three hundred feet in length, was formerly utilized for peach culture, but had been almost abandoned for this purpose, because the trees failed to give satisfactory results. The border to this wall was employed for the production of early vegetables. The few peach trees left were merely existing, and the few fruits they produced only fit for the pigs. I made a clean sweep of all the wall trees, prepared the border two feet deep, and replanted with peaches. These did exceptionally well, making clean, healthy wood, and bearing very satisfactory crops. There were no gross suckers produced, nor any indications of gumming or canker manifested by them like that which reigned supreme with their predecessors. Of course, I was careful to leave the surface soil occupied by their roots undisturbed, and administered manure to it on the trees intimation that assistance was needed.

Not in a single instance can I recall what might be termed successful wall fruit culture when the borders for the trees' roots were annually dug and cropped with vegetables. Of course, this is not saying there are none, for nothing is impossible, and an isolated case might crop up at an odd corner, but if any one does exist, it will probably be found that the soil is a very sandy character, or that the borders are raised considerably above the soil adjoining them. Unfortunately, circumstances sometimes necessitate the employing of fruit tree borders for the growth of early vegetables, but when these circumstances dominate a portion at least of soil around the tree roots should be left undisturbed. I would not have mentioned this preservation of surface roots, to which "Lux" takes exception, had I not had sufficient practical proof of the evil attending their destruction. "Lux" had better take a lesson from Nature, by visiting gardens, fields, and forests, and noting the different effects produced by the destruction and preservation of surface roots generally. He will then find that the tree whose roots can breathe, as well as its leaves, is the one that yields the best return for labour and money spent upon it.

J. RIDDELL.

THE CAROB TREE.

THE Carob tree *(Ceratonia siliqua)*, so extensively cultivated in the more arid parts of Southern Europe, of which it is a native, has of late obtained considerable attention, in consequence of the opinion of those familiar with the various aspects of vegetation in South Africa, that its introduction to the Cape Colony would prove of immense value to an important section of the colonists. As described by the Kew authorities. it is a leguminous plant, usually from 15 to 25 feet high, with few branches and dark green pinnate leaves composed of two or three pairs of leaflets of a leathery texture. The flowers are polygamous or diœcious (*i.e*, either self-fertilising or unisexual on different plants), arranged in small red racemes. The pods, known as Locust beans or St. John's Bread, are full of a sweet mucilaginous pulp, 6 to 10 inches long, and contains numerous seeds. They are often eaten by the poorer people in the Levant, and serve as a useful food for cattle. The seeds are also said to be used in the preparation of mucilage. In Italy and Southern Spain the tree is cultivated in dry, stony localities, and yields valuable crops. The value of the carob pods exported from Cyprus has, in some years, reached £65,000.

There are several cultivated varieties, and as the tree is usually diœcious it is necessary to engraft seedling plants in order to ensure large crops. For cultivation in hot and dry districts, with stony soils, there is little doubt that the carob is a valuable tree, and deserves to be widely cultivated. It requires warmer conditions than the orange, *i.e.*, a mean yearly temperature of, say, 66 deg. Fahr. It is said to prefer a calcareous subsoil. It begins to bear at about eight years old, and a single large tree may yield pods weighing in the aggregate about 2 cwt. Carob trees are familiar objects in some parts of the Canary Islands, especially above Puerto Cruz, in Teneriffe. There they are evidently seedlings, and produce only a scanty crop of pods. There is, we learn from the *Kew Bulletin*, in the garden of Dr. Grabham, at Funchal, Madeira, a very handsome Carob tree. The main stem has a circumference of fifteen feet; at about eight feet from the base it divides into numerous wide-spreading branches, and covers a considerable area. As it is the only tree in the neighbourhood and produces a fair crop it is probably self-fertilised. The carob tree was introduced to Jamaica in 1883, chiefly from seed gathered by the present Assistant-Director of Kew, from the Madeira tree above-mentioned. The plants have grown well in the plains, but those that have hitherto flowered have produced male flowers only. Steps are now being taken to introduce grafted plants from Naples, where they are raised in large numbers for planting in Southern Italy.

The English Consul at Naples has recently presented a remarkably interesting report to the Foreign Office on the propagation and cultivation of the carob tree, and in his opening remarks he says:—

In the course of last spring a well-known gentleman from South Africa made inquiries at the English Consulate concerning the cultivation of the carob tree and the possibilities of its introduction into the Cape Colony. The carob or locust bean is a tree the fruit of which consists of a long pod, which not only forms excellent horse food, but is very largely eaten by human beings, especially children, on account of its sweetness. The pods contain very hard beans, which are useful only for seed, as horses leave them in their mangers, and if by chance they swallow them, it is found that they do not digest them. The trees bear, moreover, thick dark evergreen foliage, which gives a cool and grateful shade. It grows in many places in the Mediterranean where nothing else will grow, notably on the arid hills of Malta, and it seems certain that in the endless varieties of soil and climate to be met with in the Cape Colony there must be many districts where it would grow freely. The successful result of such an experiment would be simply invaluable to the colony if merely as a supply for horse-food, for one of the greatest difficulties in travelling at the Cape is to feed one's horses, the price of forage in some districts being extremely high, and the supply often distressingly short. Forage, moreover, as it consists of oats with their straw, is not readily portable, but carobs enough for a pair of horses for a day can be carried in a small bag. The carob in Italy grows alongside the oranges and lemons, and there can be no reason why it should not grow with the magnificent orange trees of Wellington, and become as superior to the carob of Italy as the Cape orange tree is superior to its Italian prototype. In places like Graaf-Reinet, and Aliwal North, the success of the experiment seems absolutely certain, while, judging from the way the tree prospers on the dry stone of Malta, where it grows with apparently no soil to help it, there is good hope that it might take kindly to the "Kopjes" near Colesberg, the bush veldt of the Western coast, the lower slopes of the Drakenfelds, or among the trees of the Knysna forest. The Consul being well acquainted with the Cape Colony, has investigated the matter thoroughly, and, after lengthened consultation with practical arboriculturists, the following *modus operandi* has been decided upon. First, a sufficient quantity of seed will be sent out to grow a number of seedlings in different parts of the colony. These seeds will produce carobasters, which will not have a fruit worthy of the name till they are grafted. The strongest seedlings may be grafted in their third year, but it is of no use to graft until the plant is strong and well grown, which may not be till it is five or even seven years old.

A number of plants in pots will be grafted at Naples next spring, repotted in larger pots with plenty of clay, and when the grafts have taken well the trees will be packed, the clay well soaked in water, and it is confidently hoped that they will bear the journey satisfactorily. They will be sent from Naples in the month of February, and will probably travel viâ England, which seems climatically preferable to the East Coast route, by German steamer to Durban viâ Zanzibar.

After giving full directions for the management of imported plants, the raising of seedlings, planting, and grafting, and ample information on the conditions most conducive to the trees when established, Mr. Neville-Rolfe continues:—

Some years ago the Italian Alpine Club agreed that it would be greatly to the advantage of South Italy, and would add materially to the attractions of the mountain scenery, if the Apennines, which are now for the most part quite bare, could be made to grow trees such as there is every reason to believe that they did in more ancient times. They determined to consult Signor Savastano, the professor of arboriculture in the School of Agriculture at Portici, near Naples, who gave it as his opinion that the mountains where the lentisk and the myrtle grow freely enough could be utilised to produce the more remunerative carob. To the obvious advantage of reafforesting the mountains, and thus adding to the rainfall, would be added the production of a valuable crop where nothing saleable had grown before.

The great carob-growing districts of South Italy are in the Bari region, on the Adriatic coast, and quantities are exported annually to Russia and Central Europe from Brindisi and the other ports along the coast. Though the tree may be seen in almost any garden in Naples, and is not uncommonly found on the mountains, the only person who has made a hobby of its cultivation is the Prince of Belmonte, who has large properties in the province of Salerno, not far from the ruins of Paestum. Besides planting several trees in his shrubbery, the Prince has a long avenue of them leading up to his house, which is particularly interesting, and is, we believe, the only avenue of its kind. The trees are planted 7 metres apart, and the largest of them has a trunk of 85 centimetres (about 2 ft. 9 in.) in circumference. This tree is eighteen years old, and its top is from 6 to 7 metres in diameter, and 4 or 5 in height. In common with the other trees of the avenue, the fruit is of the best description, and each tree may be taken to yield annually 50 kilos, or, say, 120 lb. of fruit, worth in Italy about six shillings. This may be spoken of as the ornamental part of the work, while the plantations of Licosa and Tresina are more on the scale of a commercial enterprise. They are both germane to our present purpose, as they show in what different circumstances the carob will grow and flourish. The Licosa grove is in a plain by the seaside, and the difference of the trees is very remarkable, some of them growing with great vigour, others not flourishing at all. The reason of this must be the existence of land-springs beneath the surface with which the weaker trees come into contact, and by which their growth is checked. There is no other apparent reason, and as the grove consists of about 1,500 trees there is scope for observation. The site is very much exposed to the wind, and in the first attempts at forming the grove as many as 70 per cent. of the plants were lost. There were other causes, too, which led up to this heavy loss. First, the whole thing being an experiment, they did not know at what period and in what way it was best to graft the trees, and also the grafters had not anything like the skill which they have since acquired.

The grove at Tresina is planted in altogether different conditions. Here we have a hilly country fully 1,000 feet above the sea, and here the outside loss of plants has been 20 per cent., which is not more than occurs in the planting of ordinary forest trees. The plantation consisted originally of 7,000 trees, but has been largely increased year by year, and the Prince expresses every confidence that in a few years' time he will clothe the barren slopes with a mantle of luxuriant green. Professor Savastano asks very pertinently why, if these results can be obtained at Tresina, they should not be obtained elsewhere, and thousands of barren acres of Italian mountains be made useful and productive. And, in fact, since he wrote upon the matter, the spread of this cultivation has been steady and continuous. We have shown pretty plainly that Prince Belmonte has attained success only by patient experiments extending over a considerable number of years. Commercially speaking, he is abundantly satisfied with the results obtained, but he does not relax his efforts. He rears some 8,000 seedlings every year, and has a skilled staff to conduct all the necessary operations, with the result that he grows a valuable crop on ground which before was absolutely unproductive; and if the landed proprietors of South Africa profit by his experience, and are equally persevering, and the tree, as is anticipated, proceeds to grow like a weed, its introduction should, in the opinion of the Consul at Naples, form a mine of wealth to the Cape colonists.

Chrysanthemums in France.—Although chrysanthemums have been long grown in France, yet it is only in recent years that they have found especial favour in the eyes of the general public. The cultural manual by Lebois, published in 1854, was probably the only one of any importance for many years, but the flower no doubt received attention at the hands of some of the botanical writers both before and after that date. We are reminded of this by a recent acquisition to our library, entitled "Sur les Chrysanthèmes d'Automne de nos Jardins, par Charles Des Moulins," a reprint from the Bordeaux Academy of Science in 1[illegible].
